THE HARQUA HALA.—The Harqua Hala mines, near the Colorado rim, have evidently struck bottom, after having produced millions. The present owners will ship their machinery to South Africa, having no further use for it at Harqua Hala. The mine seems to be completely worked out. For several years it produced from $50,000 to $100,000 per month for its owners. The present owners, however, bought it about a year ago, paying therefor something over $1,000,000. They have succeeded in getting only a small portion of their $1,000,000 back again; but there are many thousand tons of valuable tailings, now valuable because of the cyanide process, which will now be worked, and the owners think their purchase price can be realized. About a year ago a gold brick was shipped from the Harqua Hala mine over the Southern Pacific railroad of the value of $110,000, the result, so it was said, of one month's run and being the largest single gold brick ever made from any Arizona mine in one cleanup. It was taken from Harqua Hala to Yuma by a six-mule team, armed guards riding before and behind. The brick was inside a nail keg in a large lumber wagon, and just as they were entering the town of Yuma the driver cracked his whip, the wagon ran into a deep rut and the nail keg with the brick went through the bottom of the wagon box. The heavy weight condensed into so small a space was too much for the $1\frac{1}{4}$ inch of the wagon box.

The old Hillside mine has been again started up, it having reverted to the original owners, Lawler and Wells, of Prescott. This mine at one time had the reputation of being the richest silver mine in the territory and attracted a great deal of attention. It was sold for $800,000 and partially paid for when some trouble arose over the balance of the purchase price. The ore is of a high grade. Two carloads are now on the track at Hillside switch ready for shipment. It is the hope of the present owners to soon ship a carload per day. The ore carries good value in gold, although the great value is silver.

A. G. Simpson, a Scotch mining engineer, has completed an examination of the Waters mine, now known as the Santa Maria mine, about thirty-five miles from Congress. The mine is owned by Chauncey Clark, of Chicago. The Santa Maria has a vein exposed about 2000 feet, has seven tunnels driven in on the vein at successive intervals of 100 feet, the ore being of uniform quality and easily treated by stamp mill. Twenty stamps are now at work night and day and sixty more stamps are on the way.

BISBEE.

THE COPPER QUEEN.—The mining department, since the death of the late Mr. Howell, is under the direction of Mr. Clawson. There are about 300 miners at work on day and night shifts. The Czar shaft, where the main hoisting works are established, and where the ore is all brought to the surface, is down 400 feet. Drifts have been made at each 100-foot level in several directions, and rails are laid to the several ore beds, so that now the tracks are about forty-five miles in length. One drift runs back under the mountain about one mile. There are about 800 tons of ore raised every twenty-four hours. The shaft at the Holbrook is down to the 500-foot level. There are hoisting works there also, but nothing but the waste is raised there. The ore between the drifts is obtained by putting in stopes, and the miners work upward and dump the ore below, where it is conveyed through a chute to the cars that carry it to the central shaft.

The treatment of ore is under the direction of Lewis Williams. Four smelters are running day and night, which reduces between 700 and 800 tons of ore daily into what is called matte. It contains from forty to fifty per cent pure metal. This is broken into small pieces and run through another smelter, where it is melted and run into the Bessemer convertors, where everything except the metal is burned up and blown away, so that which is drawn from these convertors is pure metal. The output of bullion is about thirty tons per day.

## MEXICO.

SONORA.

SOME BIG STATEMENTS.—*Oasis:* At La Colorada last week one of the most important mining deals in the history of Sonora was consummated, the Grand Central mine being sold by Mr. F. H. Seymour and associates, to Mr. Howell Hines and those associated with him, for a consideration of $150,000 gold. It is stated that eight hours after the deal was closed Mr. Seymour received a telegram that a representative of an English syndicate was on the way to La Colorada, prepared to pay him $500,000 for the property, and every effort was made to induce him to refuse to convey the property to Mr. Hines; but with a fairness extremely rare the gentleman refused to break his word. When the English syndicate representative arrived at La Colorada he offered Mr. Hines $50,000 in gold to release Mr. Seymour from his contract, but the offer was declined and the transfer was made. It is stated that the would-be purchaser (Mr. R. R. Symon, vice-president of the Sonora railway) then offered Mr. Hines $1,000,000 gold for the Grand Central and Amarillas mines and the two mills belonging to them, but that his offer was likewise declined. Mr. Hines at once took possession of the Grand Central, set a large force of men at work making necessary alterations and repairs.

## Coast Industrial Notes.

—January's foreign imports to this city aggregated $3,415,393.

—The Central Lumber Trust is expected to go into effect March 15th.

—There are 6635 houses in Sacramento, Cal., of which 6101 are occupied.

—The Golden Gate Woolen Mills started up last week with 150 employes.

—Over 700 people are now employed at the Potrero Sugar Works, this city.

—Oakland's city engineer proposes to expend $100,000 in a driveway and drainage system for Piedmont.

—Opposition on the route from Puget Sound ports to this city has lowered ocean freights northward from $2.40 and $3 per ton to $1.

—The line of the Nevada County Narrow Guage railway is to be rebuilt, shortening by three miles the distance from Colfax to Grass Valley.

—The preliminary announcement is received of the 29th Industrial Exposition of the Mechanics' Institute, to be held in its pavilion in this city from Sept. 1st to Oct. 3, '96.

—The machine shops of the Mexican International railroad at Ciudad Porfirio Diaz, Mexico, were destroyed by fire last Saturday with two locomotives. The aggregate loss is $200,000, with no insurance.

—The Pacific Rolling Mills are now using three carloads of oil daily, which will soon be increased to four. It has been their experience that oil at $1.25 per barrel is cheaper and more satisfactory than coal at $7.50 per ton.

—Another 30-ton rifle was added to the Fort Point battery this week. There are now two 30-ton and one 50-ton, which, with the three dynamite guns lately tested, make San Francisco the best defended harbor in the United States.

—The largest stick of timber ever cut on Grays Harbor, says the *Washingtonian*, was turned out in January by the Northwestern Lumber Co. at Hoquiam. It was 119 feet long and 22 inches square and is for a mast for the schooner Volunteer.

—Whyte & De Rome, of this city, are building a newly invented propeller, the joint invention of two machinists, Hall and Sloan. It is to be used on the tug Reliance. It is to be 6½ ft. long, 6½ ft. in diameter, 4-bladed, each blade to have a 5-inch flange. The propeller is to be of gun metal, and weighs 3000 pounds.

—The Southern Pacific shops in Sacramento are again running full blast. The force now numbers 1700. A new federal law compels all railroads to equip freight cars with automatic couplers by the 1st of January, 1898. It is a big job to do this, as the Southern Pacific system has two couplings which cost $10 each, and all cars which leave the State will have to be equipped. The cost to the railroad will be $294,000.

—A deal is reported between the Southern Pacific and the seaboard air lines whereby all the traffic that can possibly be diverted to the former's Sunset route will be delivered by the latter at New Orleans, which is considered to be a direct blow at the Southern Pacific direct connections at Ogden. Its object is said to be to divert as much traffic as possible from the Central Pacific road, the Southern Pacific having entered upon a deliberate and systematic policy of impoverishing that part of its system with the view of forcing the United States to settle its claims against the road on the easiest terms possible.

—H. R. Robertson, who built the cigar-shaped raft from Stella, Wash., to San Francisco last year, after two disastrous experiments in the same direction, has arranged to commence felling timber immediately for three rafts to be put together in March and sent to California. They will probably be gotten out at Stella, though the cost of towing would, it is stated, be $150 less, or $1450 from Puget sound, as against $1600 from the Columbia river. The rafts will be cigar-shaped and of uniform size, each 527 feet long, 52 feet wide, 30 feet deep, and drawing 20 feet of water when floated, and will contain some 5,000,000 superficial feet of lumber each, board measure. The lumber shipped, which includes piling and spar timber, saw logs and long timber of every description, will be packed in a cradle, constructed for the purpose.

## Recent Mining Incorporations.

Horseshoe Consolidated Mining Company, San Francisco. Directors—N. T. Messer, H. Zadig, O. F. Giffin Jr., J. W. Twiggs, E. L. Parker; capital stock, $10,000,000.

Florence Gold Mining Company; directors, G. J. Bucknall, C. T. Dennis, H. E. Poehlman, W. O. Scott, J. H. Ginder and G. M. Spencer, San Francisco; capital stock, $150,000, of which $3500 has been subscribed.

Rogue River Water and Mining Company; directors, J. W. Northrup, W. F. Hyde, D. Suter, C. T. Dennis, A. N. Hungerford; capital stock, $5,000,000, all subscribed; San Francisco.

The Florence Gold Mining Co.; principal place of business, San Francisco. Directors—G. J. Bucknall, C. T. Dennis, H. E. Poehlman, W. O. Scott, J. H. Ginder, G. Senn, G. M. Spencer of San Francisco; capital stock, $150,000, with $3500 subscribed.

## Obituary.

CAPT. C. JEFFERSON CLARK died last week in London, England. Deceased was a well known California miner. Till recently he was manager of the Gladstone mine, Shasta Co., when he went to Buluwayo, South Africa, where he was amassing a fortune when stricken by fever. He went to England, where his illness proved fatal.

## Commercial Paragraphs.

THE California Powder Works report having sold over 4000 tons of dynamite last year.

THE Fort Wayne Electric Co. has opened its branch office this week at 16 Second street, San Francisco.

THE General Electric Co. has a contract for the Mount Tamalpais electric road, 33,000 feet long, average grade 6.1 per cent, maximum grade 8.2 per cent. The company will furnish one 100 Kilowatt generator, and one car, of the double fifty H. P. motor type, fitted with improved electric brake. The road is to be completed in sixty days. There are now over 200 men at work.

The Jos. Dixon Crucible Co. have opened an office at 1315 Monadnock Block, Chicago, Ill., which is in charge of Mr. F. W. Musson, and have added to their office force Mr. W. C. Mahaney, formerly Western manager of the *American Machinist*. Mr. F. W. Musson will have the leadpencil cinch for the West and Mr. Mahaney will look after their Chicago interests in the lubricating and paint departments.

LARGE ORDERS have recently been received by the H. Channon Co. of 24-26 Market St., Chicago, for their Ajax transmission rope from the following: The Boston & Montana Consolidated Copper and Silver Smelting Co. of Butte, Montana; The Helena Light and Power Co. of Helena, Mont.; The Illinois State Penitentiary at Joliet; The North Chicago Electric Street Railway Co.; The Cleveland Linseed Oil Co. of Chicago; The Independence (Ia.) Water Works; The Mankato (Minn.) Mills; The Minneapolis General Electric Co.; The Syms & Dudley Paper Co., Vatervliet, Mich.

THE Westinghouse Electric and Manufacturing Company of Pittsburg, Pa., recently shipped two of the largest electrical generators for the operation of an electric railway that have ever been turned out anywhere. These two machines were of 1500 H. P. each, and they were contracted for by the Nassau Electric Railway Company of Brooklyn, N. Y. Last summer the Westinghouse Company constructed and delivered to the same railway company three generators of 750 H. P. capacity each, making the total capacity of the electric railway plant 5250 H. P.—one of the largest in the country. The new generators are of the style known as engine-type, being direct connected to a Cooper Corliss engine running at a speed of 75 r. p. m.

THE Cliff Paper Co. of Niagara Falls is building a new power-house, in which it will generate electricity for use in its paper mill. This paper company has a pulp mill, driven by two Leffel wheels, of 2500 horse power, at the water's edge below the Falls, and a paper mill on the top of the high cliff, thus securing a double service from the water. This double use of water is quite an innovation, and has brought discredit upon the saying that "the mill will never grind with the water that is passed." Now this progressive company is about to take another step to practice economy, and it will adopt electricity to succeed steam to run its paper machines. When this proposed electric plant is installed, it will drive out three steam engines of over 200 horse power. Preparatory to the adoption of the electric current, this company will build a stone power-house, 20x30 feet in size, close to its pulp mill. The penstock, leading to the pulp mill, will be tapped, and a portion of the water diverted to run a 250 horse power James Leffel turbine, to which will be attached two 125 horse power generators. The headwater on this turbine will be 125 feet. At the top of the cliff will be two electric motors, of 100 horse power each, attached to each of the paper machines. Besides, there will be two motors of five horse power each, to furnish power for the small machinery about the mill.

## Personal.

F. J. CAROLAN heads a Chicago company that proposes to buy the Kirkham mine, two miles west of Nevada City.

LIEUT.-GOV. F. H. LUCE of Washington State, speaking of his Triune mine near Davenport, Wash., says he expects to increase from ten to twenty stamps this spring.

ASSISTANT STATE MINERALOGIST PRESTON is inspecting the Grass Valley and Nevada City mines this week. Assistant W. H. Storms is writing up the notes of his recent field work.

FRANK L. BROWN, of the Washburn & Moen Manufacturing Co., has returned from Worcester, Mass. In accordance with the recent action of the Pittsburg manufacturers, there will be an advance of 15 cents in the price of nails next week.

Provisions furnished for seven months.

STEADY YOUNG MAN WISHES POSITION with mining or milling company. Practical surveyor, assayer, draughtsman and book-keeper. Willing to be generally useful. References given. Address C. E., care MINING AND SCIENTIFIC PRESS.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee. If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

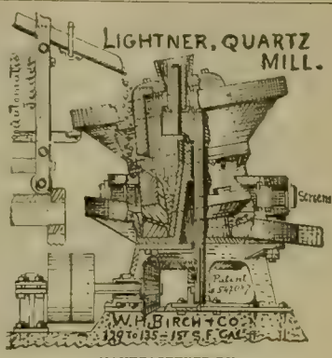
The Hendy Improved Triumph Concentrator.

# Stamp Mills.

Triumph Concentrators, Hendy-Norbom Concentrators, Rock Breakers, Hydraulic Mining Machinery, Challenge Ore Feeders, Steam Engines and Boilers, Hoisting and Pumping Machinery, Water Wheels.



WE make mining machinery of all kinds. We also "make the Miner," that is, Woods' Dry Placer Miner, as illustrated here. Users say it is "really perfect." In writing about it ask for catalogue 51.

Smelters are using our semi-steel moulds, kettles and pots extensively; they give first rate satisfaction. We are also making welded steel water jacket furnaces, better than anything previously produced. Among specialties of our manufacture are perforated metals; also riveted steel pipe for hydraulic lines. You will find us obliging in making estimates and giving particulars, as we aim to serve the interests of our customers in the best way.

## THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c. | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c. | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c. | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

# Market Reports.

## The Markets.

SAN FRANCISCO, Feb. 20, 1896.

There is a general improvement in all the metals to be noted this week. Even lead shows a little advance. Whether it was the bond issue, the increasing amount of daylight, or the regular spring advance, a better condition exists all round. The only noticeable exception is in the price of quicksilver, which was quoted last week at $37.50 per flask in New York, the London price being £7 2s 6d. Regarding copper, under date of the 3rd inst. James Lewis & Son, 5 Fenwick street, Liverpool, England, write:

Large purchases of good merchantable copper, made for the purpose of advancing the shares of the leading copper mining companies, followed by considerable buying on the part of smelters and manufacturers, has caused an advance of £3 7s 6d per ton since the 7th ult., when the price had fallen to £40 10s for cash—from £41 7s 6d on the 2nd ult. The closing value is £43 17s 6d for cash and £44 5s for three months prompt, although £44 10s was paid for the latter on the 31st. The sales amount to about 26,000 tons. In contrast with the experience of last year, when the English market followed slowly behind the advance which took place in the United States, prices here are considerably higher than those ruling in New York. While this lasts, shipments of American copper to Europe are likely to continue large, especially as the American demand for home consumption will probably not be very active for some months to come. Best selected in Birmingham now realizes £1 per ton more than lake ingots in New York. Quotations to-day are:—Chile bars and good merchantable copper £43 17s. 6d. for cash, and £44 5s. 0d. for three months' prompt, buyers, English best selected ingots £48 5s. to £48 10s. and tough cake £47 10s. to £47 15s. per ton. 8s. 6d. for ore of 20 per cent, and 8s. 9d. per unit for Chile regulus or American matte, free from silver.

Of coal in San Francisco, Harrison's circular says: During the week there have been ten arrivals from the Coast colleries with 20,846 tons; no cargoes from any foreign port. There is no new feature in this branch; business generally is dull. The retail trade has fallen off since the storms ceased, as it usually does, but prices are firmly sustained. The demand for steam uses is fair and quotations are fairly well maintained, as the arrivals of late have not been excessive and stocks on hand are not unusually large, except anthracite, of which an extremely bountiful supply has been piled up. As the number of vessels now loading at Swansea is very light, and freight rates being advanced, what is now in yard may prove to be profitable property later on. The sales of Swansea this year will not be as large as in 1895, as the prices of Australian shipments will be so much lower that the trade will be deviated in that direction.

## Mining Share Market.

SAN FRANCISCO, Feb. 20, 1896.

For the week under review the market has held remarkably steady. There has not been a ten-cent rise or decline for several days. Legitimate transactions have been scarce, but cross-orders and accommodation sales, it is said, constituted the larger proportion of the buying and selling. So light has the business grown to be that last Tuesday the brokers had to go on the sidewalk during the informal session, to keep from going to sleep. At the close of yesterday the market began to give signs of doing better, but at this writing it is hard to say how much. Thus more life will have to be shown to draw in outsiders. It looks very much as if the little pools that have been trying to manipulate the market for many months past are getting tired of the game. They, like all else who have only from $50,000 up to $250,000 or even more to operate with, have discovered that it takes a brainy man to put up prices, and even be could not do it unless backed by several million dollars. In an active market shares in fully twenty mines are dealt in, which aggregate over two million shares. To handle over two million shares in a deal a pool must have plenty of money to take every share thrown at it, even when prices have been advanced to, say, three or four times what they were at the commencement of the deal, and if it is found necessary to send the market to still higher figures then the pool should be equally prepared to take all shares offered, even if they aggregate in value over a million dollars at any one board. Dealers and also those contemplating to operate should not forget that until moneyed men come in the market actively and openly it is a dangerous game. There never was and never will be good prices for shares until such men as Col. Hayward and J. W. Mackay come in openly, and they will not do this unless there is merit in two or more mines. Merit in one mine, unless it is a bonanza, does not count now. This was shown when Con. Virginia paid several dividends but the shares did not go up to any extent. Active work is being done in several of the mines to discover an ore body of more value than has been found for several years past; if success should crown the efforts then it can be asserted that moneyed mining men will enter the market and bring about a good old-fashioned deal. The writer holds to the opinion that some day this will be done, but how long time alone will tell; but the Comstock is prolific in surprises and it is by no means "played out."

The news from the Comstock points to the usual active spring work. There are reports current that some of the mines will take on more men, but these rumors are not substantiated. Those in position to know say that it is hardly likely that this will be done unless miners should work for less wages, for assessments come often enough now without increasing expenses to bring in more. In the Alta group the advices seem to be more encouraging from Alta, in which mine they are fooling around the Keystone ledge. In Overman the work is said to be growing in interest, but this has been the case so often that dealers prefer awaiting results than the surething assessment which has invariably followed good reports. In Seg. Belcher, Belcher and Crown Point the work is essentially unchanged. Not one of these companies is helping to pay expenses by extracting much ore. The work in the mines is in the proper direction, but it will take more time and money to see what there is to be found. No authentic information is allowed to leak out concerning the work under way in Yellow Jacket. In Challenge, Confidence, Con. Imperial and Alpha the work is largely on the upper levels, where it is known some good to high grade ore exists, but there seems to be some kind of fatality about the work, for when it seems just about ready to strike ore it is either stopped or turned. In the middle group there is more or less ore being extracted as the work is prosecuted on the different levels. But this does not help the shares, for the quality is not of sufficient moment to attract attention of dealers. There are miners who claim that some day the managers will find a big bonanza in one or two of these mines, but as these miners have lost money on the proposition, they do not seem to be good men to follow in a gamble. In Con. Virginia the usual active work is being done, with more or less ore extraction, but the latter is not in sufficient quantity or of high enough grade to pay current expenses. So far the work under way has been disappointing, for it was confidently asserted by miners that better things would result, and long before this, too. The president of the company, Mr. Fish, went to the Comstock this week and perhaps he may try to find out, but neither he nor anyone else can find ore unless it is in the mine. In Ophir and Mexican the work ought soon to grow more interesting, but whether it will result in a rich ore strike is entirely guesswork. In Union and Sierra Nevada the work under way is not attracting attention. Sometimes when this is the case it is that which results the most favorably.

Advices from the Brunswick lode are to the effect that active work is still the order. Cross drifts, winzes, lateral drifts and all such work is being done. It would seem to indicate that the managers are leaving nothing undone to lay the foundation for better work later on, with the hopes of discovering ore, if there is any to be found in sufficient quantity to justify working or extracting.

From the Bodie district the same old reports come to hand; no ore, but plenty of dead work seems to be the order. But assessments by the companies in this district are few and far between, which show economical working.

The following illustrates the changes of the week:

| MINES. | Feb. 13. | Feb. 20. |
|---|---|---|
| Alpha | ..... | $ 12 |
| Alta Consolidated | $ 15 | 14 |
| Andes | ..... | 16 |

# Assessment Notices.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 30th day of January, 1896, an assessment (No. 42), of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 22 Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of March, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 28th day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. TWIGGS, Secretary.

Office—No. 22 Nevada Block, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 10th day of February, 1896, an assessment (No. 3) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 38 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of March, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 10th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, 38 Crocker Building, San Francisco, California.

## DELINQUENT SALE NOTICE.

ANCHOR COAL AND DEVELOPMENT COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Kelso, Cowlitz county, Washington.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 6) levied on the 2d day of January, 1896, the several amounts set opposite the names of the respective shareholders as follows:

| Names. | No. Cert. | No. Shares. | Amt. |
|---|---|---|---|
| B. E. Loomis | 845 | 5 | $ 15 |
| J. A. Christian | 155 | 500 | 15 00 |
| J. A. Christian | 156 | 500 | 15 00 |
| Mrs. Edith Grey | 222 | 100 | 3 00 |
| Mrs. Edith Grey | 223 | 100 | 3 00 |
| Geo. E. Alexander | 670 | 200 | 6 00 |
| Geo. E. Alexander | 671 | 500 | 15 00 |
| Geo. E. Alexander | 707 | 225 | 6 75 |
| C. S. Capp | 838 | 5 | 15 |
| Geo. F. Tuttle | 214 | 1,000 | 30 00 |
| Geo. F. Tuttle | 215 | 1,000 | 30 00 |
| Geo. F. Tuttle | 681 | 400 | 12 00 |
| Geo. F. Tuttle | 683 | 500 | 15 00 |
| James E. Ager, Trustee | 651 | 500 | 15 00 |

| W. H. Greg ry | 689 | 500 | 15 00 |
| W. H. Gregory | 697 | 500 | 15 00 |
| Wm. Lynch | 705 | 150 | 4 50 |
| John Tarpley | 706 | 125 | 3 75 |

And in accordance with law, and an order from the Board of Directors, made on the 2d day of January, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, No. 632 Market St., room 5, San Francisco, California, on THURSDAY, the 5th day of March, 1896, at the hour of 1 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. D. FARISH, Secretary.

Office, No. 632 Market street, Room 5, San Francisco, California.

## Position Wanted

BY A YOUNG MAN ABOUT MINE OR MILL. Is a competent assayer and a well read, handy and practical man. Address

**ORO FINO,**

**Care of Mining and Scientific Press.**

## Mariposa Gazette.

While the great Mother Lode of California is attracting attention all over the world, it is to people right on the spot that we must look for correct information. With regard to the southern end of the great Mother Lode, the *Mariposa Gazette* is usually our most trustworthy informant. Established for over 40 years at Mariposa, the *Gazette* has always maintained a reputation for honesty and fearlessness. In the history of California 40 years is a long time, but the *Gazette* has profited by experience. In mining matters it is conservative to a degree. As regards its news of Mariposa mines it is to be relied upon, and persons wishing information about that locality, or desiring to advertise their wares among the mining community, should remember that the *Mariposa Gazette* is the paper that for 40 years has found its way into every household in Mariposa. *

# RUPTURE CURED.

Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING FEBRUARY 11, 1896

554,213.—PAPER MOLDS.—S. Crump, Spokane, Wash.
554,506.—VALVE.—S. Elde, S. F.
554,580.—BOAT PROPULSION.—W. Forward, San Diego, Cal.
554,555.—NAIL SETTER.—H. S. Garr, Los Angeles, Cal.
554,310.—ENGINE.—J. L. Heald, Crockett, Cal.
554,375.—FIFTH WHEEL.—T. C. Reed, Los Angeles, Cal.
554,551.—ORE WASHER.—C. H. Thomas, Sonora, Cal.
554,143.—PRINTING TOOL.—W. S. Young, Lordsburg, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MINING PUMP.—Wm. Nance, Grass Valley. No. 554,082. Dated Feb. 4, 1896. This invention relates to improvements in pumps of that class which is employed for pumping from deep mining shafts, and it is especially adapted to pumps of that class known as the "Cornish" type. It consists of a vertically reciprocating pump rod, a pump cylinder with inlet and outlet valves; a piston reciprocating in the cylinder; a piston rod extending through a stuffing-box in the upper part of the cylinder; a distance block fixed to the pump rod, projecting to one side therefrom into the line of travel of the piston rod from the pump cylinder; a connection therewith consisting of a block with a dovetailed slot and a key by which the piston rod is secured to the block. In connection with this are bell-crank oscillating levers or pipes, a horizontal arm of one being connected with the pump rod, and the other carrying a counterbalance weight, the vertical arms being connected by pitmen with an engine crank intermediate between the two. A horizontal rod extends beyond the weight-carrying bob or lever and has a bumper mounted upon it adapted to make contact with a fixed cushion through which the rod passes so as to relieve the jar of the parts on the down stroke of the pump rod. Novel forms of packing are used in the pump cylinders, with a means for maintaining a constant pressure thereon so as to cause the lubricating material to constantly fill the interstices of the packing. The valves are peculiarly constructed, and in connection with the usual valves I have shown a supplemental inlet valve removably fitting the cylinder above the main inlet valve chamber, so that it can be introduced or substituted for the main valve at any time. The packing of the pump valve is cast integral, having a cylindrical enlarged upper portion forming an extended bearing with parallel sides, having the lower portion reduced in diameter, a metal ring surrounding the lower portion to clamp it upon the valve, and a ball or yoke with keys and means for retaining the ring in place.

**CHICAGO GAS & GASOLINE ENGINE**

Used for making Electric Light or furnishing power for any purpose required. Specially adapted for electric light in private enterprises. The latest great invention of this progressive age. Built in from 2 to 50 horse power. Stationary or portable. Is the simplest power on the market. A dwarf in size, a Samson in strength. Costs but little to run it. Has no equal for even speed and durability. Send for catalogue

### The Corral Hollow Coal Mines.

Much has appeared in these columns in the last year regarding the coal mines at Corral Hollow, Alameda and San Joaquin counties this State, their extent, development and economic value. Herewith is produced some illustrations of the general appearance of the mine and its vicinity and of its interior. Fig. 1 shows the entrance to the tunnel at the bottom of Corral Hollow. It is 10x10 feet, 3000 feet in length and has a double track. It cuts ten coal veins about 700 feet below the surface. The first vein is five and one-half feet thick, the second about eighteen inches, the third is six feet wide, the next ten and one-half feet in width. On this a drift has been run about 1800 feet and a shaft sunk over 400 feet. Fig. 2 is a reproduction of a flash-light picture, sho a coal vein on that level twelve feet wide. The entire property is being developed and after the expenditure of several hundred thousand dollars it is the opinion of many competent men who have examined the miles of underground workings, that there is enough coal there to solve the problem of cheap fuel for San Francisco manfacturers, at a distance from the metropolis of less than forty miles. Fig. 3, and Figs. 4 and 5 on page 165, give an idea of the general appearance of the country and its formation. In a previous issue was published an illustrated article, treating more particularly of the geological formation. In addition to the coal, the company has clay, limestone, and sand suitable for glass making. It is also claimed that cement equal to the imported article can be made there for 80 cents per barrel. It is further intended to erect a 4000 H. P. electric plant at the mines, to furnish light and power. If all the plans of the promoters are brought to fruition, the potency of such a factor in the industrial development of the adjacent country can scarcely be overestimated.

FIG. 1.—ENTRANCE TO 3000-FOOT TUNNEL, CORRAL HOLLOW MINES.

FIG. 2.—12-FOOT VEIN OF COAL, CORRAL HOLLOW MINES.

FIG. 3.—GENERAL VIEW OF CORRAL HOLLOW MINES.

THE Yreka, Cal., *Union* of the 20th has the first publication of application by the Central Pacific R. R. Co. for patent for several thousand acres of land in Siskiyou Co., being "supplemental list No. 32, A." Its character is illustrated by one "description": "Township 41, Range 6—all of sections 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35." Eighteen sections, 11,520 acres in that one line. There is a column and a half of finely set type of such "descriptions." Protests or contests may be filed at Redding up to April 20th.

THE semi-annual report is received of the general manager of the Broken Hill Proprietary Co., L't'd., Barrier Ranges, Silver Field, New South Wales, for the six months ending Nov. 30, '95. During that time, in the refining plant, 12,986 tons of bullion were treated, producing 3,864,362 ounces silver and 2,288 ounces gold, at a cost per ton of bullion of £1 4s 6½d. There was additional product of 12,267 tons lead. The gross product of all the furnaces and the leaching and amalgamating plant was 4,158,551 ounces silver, 13,712 tons lead and 168 tons copper. The net profit for the six months was £292,162 5s 6d. There were treated 222,324 tons gross of ore. During the period under review the company paid its one-hundredth dividend, and up to the close of the half-year had distributed £6,416,000 in cash, in additional to the nominal value of acquired shares in off-shoots of the company, amounting to £1,744,000, or a gross total of £8,160,000 in nine and a half years. The report gives minute detail of every part of the workings of the mine and all its appliances—an interesting financial exhibit of an enormous silver-producing property in a remote part of the world.

His Conscience Troubled Him; Engraving of the Homestake Company's Mill; Mines, Miners and Monopolies; A Human Salamander, 167. Coast Industrial Notes; Personal; Commercial Paragraphs; New Mining Incorporations; Recent Dividends, 172. Notices of Recent Patents, 179.

To THE State University at Berkeley is due the credit of having made what appears to be so far the most successful and direct application of the new Roentgen discovery in photographing with the dark cathode ray. The matter has attracted universal attention. Already the name of the new system is under discussion, the term "radiograph" being apparently the most applicable. Its practical value has now been demonstrated, and further scientific research will doubtless result in establishing the universal application of the new discovery. Scientists everywhere are experimenting, and while many of the results claimed must necessarily require suspension of judgment, yet it is evident that the result in this regard will be a permanent broadening of the scientific horizon.

U. S. SENATOR MITCHELL, of Oregon, has introduced in the Senate an amendment to the California Mineral Land bill which passed the House on the 18th inst., and which is now before the Senate Committee on Public Lands. The amendment provides that three commissioners shall also be appointed to examine lands along the line of the Southern Pacific in the Roseburg and Oregon City land districts in Oregon. The Oregon senator's action is doubtless actuated by the worthiest of motives, but any amendment in the Senate jeopardizes the passage of the bill. A bill originating in one house and passed therein, and then amended in the other branch of Congress involves so much subsequent conference and agreement, that a friend of the measure usually avoids any change in its original provisions after it has once passed either house.

THE statistician of the U. S. Mint in this city has sent to every part of the mining section of the State a circular saying: "Enclosed is a list of the mines in your locality with the request that you kindly correct it and add any new ones. It would be a great favor if you would make or obtain an approximate estimate of the product of any of these mines for 1895, which your familiarity with the section will doubtless enable you to do readily. Circulars have been sent to all these mines, but this many neglect to answer. In order that the county and State should receive its due credit for bullion product in the Government reports, it is important for us to get full returns. In obtaining these we have to depend largely upon gentlemen like yourself, who have a public-spirited interest in the mining industry. Will you please estimate also the average number of miners employed in the vicinity and the average rate of wages paid." Such information is of direct value to the mining industry of the State and coast, and a general compliance with the above request would be of material aid. Information so received is held as confidential, the aggregate of the figures, authenticated and compared, being alone given out for publication.

"SHALL We Abandon the Horse-Power Unit?" is the caption of a timely article in the current number of the *Scientific Machinist*. Our contemporary argues that the present conditions no longer justify a "horse power" as a unit of measure for power from an engine. The horse was to the age of Jas. Watt what the steam engine is to this. The decline of the horse as a commercial factor is manifest, and the time seems approaching when the term "horse power" will convey to the popular mind no more accuracy of meaning than any other obsolescent standard of comparison. It is argued that the mechanical world has advanced to a point that renders necessary a new unit of measurement, and it is suggested that the kilowatt, 1.34 H. P., be used. The present importance of the electric motor makes "H. P." a misnomer, and another unit is of present necessity. Direct connection of dynamos to steam engines suggests the use of a suitable unit of power applicable to both. There is something in the idea, but it will not immediately prevail. There is tremendous inertia in these things, and were mechanical engineers and manufacturers and every one connected in any way with the subject to agree to-morrow to adopt the kilowatt or some other symbol as the unit of power, it would be twenty-five years before the term "horse power" would be discarded. Conservatism and usage have much to do with those things. 'Tis thirty years since the United States formally legalized the use of the metric system; its superiority to the arbitrary denominations of ounces, pounds, etc., is conceded on all sides, yet we all go on using the terms "tons," "pounds," "feet," "yards," and "gallons," while agreeing that accuracy, universal application and scientific correctness justify the use of the terms "grams," "meters," "liters," etc. The term "horse power" may some day be discarded, but it is a remote contingency.

IN SACRAMENTO, CAL., exists some difference of opinion regarding just and equitable charges for electrical power. Our readers will remember the recent illustrated accounts in this paper of the successful completion of the great Folsom electrical transmission scheme, and the attendant celebration of the event, a noteworthy era in long distance electrical transmission in this State. Among the practical results was expected the economic ability of manufacturing establishments in and about Sacramento to substitute newer and cheaper means of securing power. It is now, however, claimed, with considerable show of correctness, that the power-using establishments in that vicinity, now using steam coal costing from $6 to $9 per ton, are unable to secure a rate from the Folsom Water Power Co. that would even justify any move toward discarding their present plants and putting in electrical appliances. It was generally assumed at the inauguration of the Folsom-Sacramento electrical transmission project that power would be furnished Sacramento consumers at a price that would have a relative cost considerably less than the prevailing figures. It is claimed that the owners of the electric plant represented that their electric power would or could be furnished at less cost than steam power, even were coal secured for $2 per ton. It now appears that the practical benefit resultant from the introduction of the new energy is of no present avail because of the high rates asked by the electric company. The PRESS is not prepared to state positively that such is the fact, but the assertion is made with great show of truth. The matter needs no extensive comment. It is purely a commercial proposition. According to ordinary business rules, the inducements for change must be made sufficient to justify discarding present power appliances for electrical apparatus. Regardless of what was or was not promised or expected, the question is solely a matter of business cost. The amount of the investment, and the cost of maintenance on the part of the power company, a fair allowance for interest thereon, a fair business profit, a due consideration for its own future and its permanent business relations—these are the questions that naturally occur to the electric power company. It is business every way for that company to make its charges as low as possible. Any attempt at extortion or overcharge would result disastrously to the company. Like any other industry, custom is to be fostered and encouraged by those who have a manufactured article they wish to sell. The company engender power; it is a marketable commodity; if those who by reason of location or manner of business find it economical to buy they will; otherwise they will not. The same intelligent skill and business judgment that enabled the projectors and present owners of the Folsom-Sacramento Electric Power Co. to successfully complete that great work will doubtless suggest the business action requisite to make it a financial success.

CONSIDERABLE attention has been given by this journal to the new acetylene gas, its possible importance to the mining world being recognized. Considerable discussion still goes on as to its cost, the strength of the argument so far being with those who claim that commercially the cost of production precludes its extensive use. Its opponents have also pointed out its danger. The Massachusetts Institute of Technology informs us that: "If stored in a steel cylinder of 600 to 700 pounds pressure, in the event of a fire in the building containing it it would be decomposed into carbon and hydrogen, and the latter would have a pressure of 20,000 pounds per square inch, which would burst the cylinder and cause great damage. A slight leak in the cylinder would be still more dangerous; 3 or 4 per cent of the gas in the air would cause a mixture of terrible explosive force. Acetylene gas alone can be exploded by fulminate of silver, and the copper salts of the gas are also violently explosive. One danger in keeping gas in tanks in houses would be in the formation of a copper salt near the acetylene tank." Still, undeterred by all these terrors, some fearless manufacturers are making this costly destructive compound, and its use is gradually extending. In Montana a plant is building at Great Falls that is expected to supply the mines of Butte. Doubtless the candle manufacturers will object; but if the Butte miners are furnished a better light, and if the Butte mine owners find their bills for light cut in two, it is probable the objections will be unheeded. Like all combinations of natural elements or forces, acetylene is doubtless liable under certain conditions to destroy. And, it is also probable that till produced in large quantities under more favorable conditions than have hitherto prevailed, it is more costly than its adherents claim. But it appears to have in it the same promise of economic value to the miner that has made so universal the use of many other appliances that at first were opposed and condemned.

THE cessation of Sunday work on the Comstock is a new phase of an old question. To-night for the first time since Virginia City assumed importance as a mining camp the mines there will close down till the following Monday morning. This is a matter of economy. The question of wages on the Comstock is still being discussed. For the last twenty years efforts have been made to get the wages down, but the ruling rate is still four dollars. Virginia has been the only mining center of any consequence where continuous work went on and the only place where the old $4 a day rate prevailed. The first mentioned distinction ceases to-day. The second distinction is argued for and against. It is claimed that a reduction of wages would result in an increase in the number of men employed. It is further advanced that, assessments being no longer paid with the old-time promptness, old-time standards should give way, and that in the present condition of things on the Comstock, unless new bonanzas are discovered, the present expenditure cannot be maintained. It is also stated that, if further economy is rendered necessary, the place to exercise it is not in the reduction of miners' wages, but in the consolidation of office expenses and a reduction of office salaries. So much has been said on this subject that nothing new can be added. It is a matter that is full of complications, from the political "pull" of a mine superintendent to the power of the Miners' Union, which is the most potent factor at present. The possible outcome will be a mutual agreement that miners employed in the lower levels worked will continue to be paid $4 and those employed near and on the surface a lesser amount. Time was when it made little difference how much was paid the Comstock miner, and in those times a good many men were on the pay-rolls that did no work in the mines, but those times are gone.

## Concentrates.

ELEVEN smelters are now in operation in Colorado.

PLACERVILLE'S new daily, the *Nugget*, starts off well.

THE babe born to-day must wait eight years for celebration of its birthday anniversary.

THE Kennedy, Nev., Chlorination Works is expected to resume operations next week.

PERRIS DISTRICT, Riverside Co., Cal., calculates that its gold yield for '95 aggregated $196,000.

THE *Mail* says that at Cripple Creek, Colo., a 4-room, unplastered log-house brings $40 per month rent.

THE Nevada Co. Miners' Association was reorganized at a meeting held in Nevada City last Thursday evening.

THE Senate Committee on Public Lands will consider the Johnson mineral classification bill on Monday, March 2.

THE *Enterprise* notes the advent of the woman prospector in Sierra Co., Cal., and notes the presence of two near Downieville.

UNDISMAYED by the current quotations of 68¾, two nervy men of Silverton, Col., have started a paper called the *Silver Industry*.

THERE is a bill pending in the Utah legislature to make the filing fee for incorporations 50 cents for each $1000 of the capital stock.

THE recent exhibit of the State Mining Bureau at Atlanta, Georgia, has been presented to the Girls' Normal and Industrial College at that city.

THE Gold Mining Exchange, Mills Building, this city, has completed its organization and expects to have a formal business opening about the 9th prox.

ONE of the new rules for prospecting in India is that the owner of an exploring license is not allowed to turn up the ground beyond the depth of two feet.

THE Argentine smelter at Kansas City, Kas., shipped 1795 carloads of lead during '95; its aggregate business for the year amounted to more than $8,000,000.

CONGRESSMAN BELL OF COLORADO has introduced a bill in the House to authorize the exploration and purchase of mines within the boundaries of private land claims.

AT the last weekly executive session of the San Francisco Stock Exchange an extension of two weeks' time was allowed mining companies in which to pay up their annual dues.

SO far the snowfall in the Sierras has been unusually light and the January rainfall has not supplied the usual amount. More snow and rain are needed for a profitable mining season.

IT is claimed that whisky saved the lives of three miners at New Castle, Colorado, who got drunk and failed to go to work in the Vulcan mine the night before the recent terrible explosion.

AT Leadville, Colorado, in December, the Arkansas Valley smelter, owned by the Consolidated Kansas City Smelting & Refining Company, broke the local record, running through 27,000 tons of ore.

THE next session of the Western Federation of Miners will be held in Denver, Colorado, May 11, '96, when all the Miners' Unions of the West will send delegates to represent their respective interests.

THE Northwestern Miners' Association met at Spokane, Wash., last Saturday and perfected its organization. Several addresses were delivered and harmonious action taken to develop and protect mining interests.

THE newly appointed members of the U. S. Debris Commission will begin the transaction of business as soon as the Senate formally confirms their appointment. Meanwhile Capt. C. E. Gillette is attending to the routine duties of the office.

IN the Transvaal, South Africa, there are 100,000 Uitlanders, of whom 75,000 are men, and 60,000 Boers, of whom 15,000 are men. There were less than 15,000 votes cast at the last election for President. The Uitlander population is increasing rapidly—it is estimated at the rate of 4000 a month.

SIXTEEN YEARS AGO yesterday—Feb. 28, 1880—Aspen, Colorado, was founded by B. C. Wheeler. When he drove the first stake there was six feet of snow on the level. During the last sixteen years the Aspen mines have produced $50,000,000 of silver, the output of 1895 being estimated at $4,000,000.

PRESIDENT CLEVELAND has signed the bill extending the operation of the mineral land laws to the north half of the Colville Indian reservation, in Washington, and that country is filled with eager locators. There will be considerable complication, legal and otherwise, the conflicting claims being already numerous.

FROM Meadow Lake comes the annual story that the district is to be revived. This time it is a New York company which "in the spring" will put up a plant that will work the ore to 92 per cent of its assay value. The rich but refractory ore has long been a metallurgical problem, and its fortunate solver will win fame and fortune.

A BILL is before the British Columbia parliament which, if it becomes a law, will levy a tax of two per cent on the gross output of the mines in that province, on the basis of the ore shipped. There is an annual deficit of $600,000 in the British Columbia provinces, and as in Nevada twenty years ago, taxation of the mine yield is proposed.

TWENTY YEARS AGO the famous Tillery seam of coal in South Wales suddenly came to an end and against a great fault, or dislocation of the strata. All efforts of miners and experts failed to follow it farther until a few days ago, when the lost end of the seam—consisting of 4½ feet of coal in three layers—was discovered, and the mine will again be lucrative.

TO-DAY, says last Sunday's Virginia, Nev., *Enterprise*, is probably the last Sunday on which the Comstock mines will be worked. Yesterday the miners working in the Comstock mines and at the Brunswick lode were notified that, commencing with next Sunday, the first Sunday in March, the mines would be closed down Saturday night and would not resume operations until Monday morning. This is a new departure here on the Comstock, and doubtless is inaugurated for the sake of economy. It is generally well received by the miners, the majority of whom will welcome one day out of seven as a day of rest and recreation. The Comstock mines have never closed down on Sunday, but the mines of all other big camps close one day out of the seven.

THE United States Mint in this city is coining standard silver dollars at the rate of $100,000 a month. The resumption of coining standard silver dollars commenced on the 1st inst. For January double eagles to the value of $1,820,000 were coined, and half eagles to the amount of $224,500, making a total gold coinage of $2,044,500.

JOHANNESBURG, South Africa, and the surrounding country seems to be sorely afflicted at present. The recent political complications were embarassing; then ensued a scarcity of labor; last week there was a dreadful explosion of eight trucks of dynamite, killing over a hundred unfortunates, and now comes news of a $375,000 fire, the last being evidently a gross exaggeration.

THE *Telegraph* says a letter has been received in Grass Valley, Cal., from England stating that miners are arriving in that country from the Transvaal in great numbers, as many as 150 having arrived on one ship. The letter also states that they arrived in their digging clothes, not taking time to change or secure any of their belongings.

THE January gold output at the Witwatersrand, South Africa, is announced to be 148,178 ounces—a decrease of 30,250 ounces in comparison with December, which showed a decrease of 16,790 from the November output, the figures for the last two months of 1895 being 178,428 and 195,218 ounces respectively. The decrease is ascribed to political and labor troubles.

AT the Candelaria water works, Esmeralda Co., Nevada, over 30,000 feet of old iron pipe is being replaced by new steel pipes. When finished, operations on the company's mines, which have been suspended for over three years, will be resumed. This pipe line supplies the town, the mill and mines of the Candelaria Water Works & Manufacturing Co., limited, the Holmes mine and the Mt. Diablo mine with water.

NOT to be behind other localities in strange tales of treasure, Olympia, Wash., reports the discovery of gold in the bark of fir trees. The *Olympian* says the gold "is in fine flakes, scattered all through the bark," and advances the neat theory that "the flour of gold was taken up by the roots and conveyed in the sap up through the body of the tree, finally being filtered out and retained by the bark," which is interesting, if not conclusive.

THE executive committee of the Oregon Miners' Association met in Grant's Pass last Monday. R. M. Hickey was appointed to solicit members for the association throughout Josephine, Jackson, Douglas, Coos and Curry counties. A committee was appointed to investigate the mining laws of this State and to correspond with representatives in Washington for favorable legislation on mining. The next meeting of the committee will be held on April 1st.

UNDER date of the 18th an Oregon man writes: "Our party of six will sail this P. M. at 6 o'clock on the steamer City of Topeka for Juneau, where we expect to arrive on Saturday, the 22nd inst. The entire passenger list will amount to 250, most all for the Yukon. The steamers report 10 to 15 feet of snow in Juneau and 400 miners to go over the pass, including the present list. Citizens there report the most severe winter ever experienced by white settlers in Alaska."

THE *African Review* publishes a table of South African dividends for '95. The Rand record for the year was £2,058,418, against £1,466,694 paid to shareholders for 1894. The total of South African dividends stands at £6,616,236, an increase of £3,061,660. The Rand dividends represented 25% of the value of the year's output—a higher proportion than in any previous year. Some of the total of £6,616,236 was return of capital in cases where dividends had been declared on sales of property.

FROM Vladivostock, a Pacific port of Siberia, comes the report that the agents of the Anglo-American Company have arrived with a capital of £5,000,000 to work the alluvial gold deposits of Eastern Siberia. They intend to purchase abandoned claims and expect there to extract the gold by improved machinery and processes. The amount of capital, if all subscribed, would indicate ample backing. Probably, however, two or three extra ciphers have been appended in transit.

THE O. & C. R. R. Co. has made application at the Roseburg, Or., land office for patents to another long list of lands in the Southern Oregon mineral belt. Some of these lands are in the best mining regions in Jackson county, and those interested there should send direct to the register of the land office at Roseburg for a copy of the list and instructions as to the proper action to take in entering a protest against the patenting of any parcel of this land to the Railroad Company. Any action in the matter must be before April 4th, '96.

SECRETARY OF THE INTERIOR SMITH has granted J. H. P. Voorhees, a relative of Senator Voorhees, a concession to prospect and mine for gold in the Navajo, Arizona, Indian Reservation. This is a privilege which has been sought for by miners for years, the belief being general that rich deposits of gold are to be found in the Carrizo mountains, which lie almost entirely within the Navajo Reservation. Mr. Voorhees secures a lease of a certain square mile of territory in the Carrizo mountains south of the Colorado river, in the extreme northeast corner of Arizona, which is to run for ten years.

W. H. MEDARIS, a miner at Newcastle, Colorado, was an eye-witness of the terrible explosion there last week, by which over sixty miners were killed. He says the explosion was caused in the same manner as the one at the same mine eight or nine years ago. Gas, combined with coal dust, forms an excellent medium for an explosion, especially when there is a "blowout" shot behind it. In this case, he says, a shot was probably not well tamped, the tamper blown out, and the flame set off the gas and dust. Great precautions were taken in the mine to avoid an explosion. The men were all required to carry safety lamps, and were not allowed to have any tobacco or matches. The Italians, however, were careless, Mr. Medaris says, and violated the regulations imposed upon them for their own protection whenever they got a chance.

THE United States District Attorney has commenced suit against the Central Pacific Railroad Company to recover 9366 acres of land in Butte, Sutter, Tehama, Yuba and Shasta counties, valued at about $1,000,000. The claim of the Government to a portion of the land it seeks to recover is based on the allegation that it was erroneously patented to the Oregon and California Railway Company, a predecessor of the Central Pacific, by reason of the fact that at the time the railroad company filed maps of survey, under the act of July 25, 1866, and when withdrawals of land were made by the Secretary of the Interior, the land was of mineral character, and was exempt from the operation of the patents afterward issued. It is alleged that the Government had no right to issue patents to mineral land, and did so unwittingly, so that it is now entitled to recover possession of the land.

LAST Tuesday the San Francisco Chamber of Commerce passed and sent copies of the following to the California delegation in Congress and to the Executive Committee of the California Miners' Association: WHEREAS, Legislation is now pending in Congress for the protection and encouragement of the mining interests of the Pacific coast; be it *Resolved*, That the Chamber of Commerce of San Francisco, by its Board of Trustees, cordially endorse the proposed legislation. The Government of the United States, having sold its citizens public lands for the purpose of hydraulic mining, is bound in good faith to protect them in its legal use, and to provide such accessories as will obviate any damage to the lands of other citizens. We endorse the mineral land bill which has passed the House of Representatives, as a measure which is just and equitable to all whose interests are affected thereby.

THE wily promoter is ubiquitous. The following is reproduced from a paper published in Constantinople, Turkey. "A prospectus having been issued by a syndicate registered in London under the name of the 'Kuluk Mining Syndicate, Limited,' purporting to acquire and work certain emery mines at Kosagatch, near Kuluk, in the province of Menteshe (Asia Minor), I, the undersigned, Mimico Cotaris, hereby declare that the only emery mines hitherto granted by Imperial Firman in that locality, and known by the name of Kuluk emery mines, are my property, the concession of said mines being in my name and in that of Emmanuel Economides, whose share in said concession I purchased and paid for many years ago. I have since worked the said mines for upwards of seventeen years as sole owner thereof, and recently the said Economides having, in violation of our agreement, sold over again his share in said mines to Mr. Edward Whittall, I am in litigation with the above-named parties regarding this matter, and our suit is actually pending before the competent Turkish tribunals. I further declare that it is against my will and consent that my said mines are being disposed of by the above-mentioned syndicate, and formally protest against this act of spoliation, rendering the directors of said syndicate liable for all damages which may accrue to me therefrom.—MIMICOS COTARIS."

SAYS the current *Mining World* to hand: "Some funny details of the Jameson campaign are coming to hand. The battle was fought over the Randt Gold Mining Co.'s ground, and as the manager and his wife could not get through the lines of the contending parties, they simply lowered themselves down the Violet shaft, and, with many others in a like case, spent the night in the third level. More bold than either the manager and his wife was one of the white employees, who got through and visited Krugersdorp, where, to his surprise, he found the machinery and everything else absolutely uninjured. His reflections as he came away probably were that neither the Boers on the one side nor the Jamesonites on the other had done very much execution either to themselves or to property in their vicinity, and that their skill as marksmen had been overrated. On the subject of Violet Consolidated, when the Boers arrived there on January 1st they sent all the colonials off the property, to the number of 47, and occupied the outhouses. When the battle took place the Queen buildings were somewhat damaged. The Kaffirs became very frightened and declared they would do anything but show themselves. The manager was doing all he could o keep the mine free of water. The principal point held by the Boers was the Queen block, which has a 10-stamp mill. This is about one mile from the Violet on a different series of reef."

THERE is only one bill now before Congress, says the Marysville *Democrat*, providing for an appropriation of money from the general treasury for the betterment of the Sacramento and Feather rivers that is based upon the report of Government engineers. That bill was first introduced by Congressman Caminetti and provided for $300,000 as recommended in the report of December 3rd, 1893. Because of the condition of the treasury it was agreed later that the amount should be reduced, and finally the bill was passed in the Senate carrying an appropriation of $100,000. For lack of time, and because of opposition by a few men who claim to represent the valley counties, the bill failed in the House. The bill was introduced by Congressman Johnson, one of the first sent to a committee of the present Congress, and it provides for an appropriation of $250,000. This bill is our only hope for successful legislation during the present session, in the interest of these streams, and this can be secured only by united action. The bill introduced by Congressman Johnson, January 11th, at the request of Robert T. Devlin, providing for the Sacramento River Commission, is simply a new proposition which cannot be put in operation in several years at best. We already have a commission of Government engineers who are by law instructed to disburse at once money appropriated by Congress for the betterment of the Sacramento and Feather rivers.

THE Rainy Lake, Minnesota, *Journal* of late date prints the following: "The Colorado millionaire who has discovered a vein of sylvanite 'running $149,000 to the ton' is indeed to be congratulated. Sylvanite of highest grade is 85 per cent silver, with a possibility of carrying some gold. A ton of pure silver, at present market quotations, is worth a little less than $20,000. It is this fact that makes the discovery of a vein chuck full of $140,000 ore a remarkable circumstance in the world of science, as well as of mining, contributing also, it may be, to the world of fiction." As this paragraph is likely to be more or less extensively copied, thereby conveying a good deal of misinformation, the Denver *Review* good-naturedly tries to forestall it as far as possible by giving the real facts in regard to sylvanite. Dana's Mineralogy, after stating that sylvanite is "a telluride of gold," gives its composition as follows: "Tellurium, 55.8 per cent; gold, 28.5 per cent; silver, 15.7 per cent." By this it will be seen that sylvanite, as Mr. Dana finds it, is more than one-fourth of it gold. Now, there are 29,166 ounces, Troy weight, in a ton avoidupois. If the reader will multiply $20.67, which is approximately the value of an ounce of gold, by 28½ per cent of 29,166, he will find that a ton of pure sylvanite would be worth more than $150,000. The values of the Cripple Creek sylvanite are almost entirely in the gold. Another name for sylvanite is "graphic tellurium," or "graphic gold," so called because the crystals are frequently arranged on the face of the rock so as to resemble written or printed characters.

## Comstock Ore Sampling.

Written by JOHN D. McGILLIVRAY.

The rehearing before Judge Hebbard of part of the Hale & Norcross case furnishes, in the evidence offered, some valuable lessons to miners, not only on the Comstock, but everywhere. Judge Hebbard had found in the first trial of the case that the Hale & Norcross sustained damage by the imperfect milling of the ores in the amount of $789,618. He held that the amount returned by the mills in bullion was 52.11 per cent, and that it should have been at least 75 per cent, of the car sample assays.

The Supreme Court was not satisfied with the evidence upon which he had based his conclusions, and sent this part back for rehearing. In the rehearing the subject of ore sampling and of the methods of milling on the Comstock—as to the evils and the causes of them—was gone over by the best of practical miners and experts, and many points of interest were brought out.

Louis Janin, the well-known mining engineer, was called as an expert witness in the case. Mr. Janin has had many years' experience in mining and milling on the Comstock and is thoroughly familiar with all the methods of mining in vogue there. So, on the stand, he went over practically the whole ground in dispute. Aside from its bearing on the case, much that he said is worth the attention of miners. What follows in this article is made up from his evidence as given on the trial, from data furnished by him to the writer, and from authorities he used for reference while on the stand.

As to the sampling itself, upon which the case mainly hinges, it was shown that a very careless system has been in vogue on the Comstock ever since the beginning of mining there. Correct assaying of ores is the main check by which millions are guarded wherever mining is done, and if assaying is to be of any value at all, careful and correct sampling must be done. Professor Christy of the College of Mines of the State University, in a paper published by the American Institute of Mining Engineers, says of this:

"Haphazard and occasional sampling and assaying are worse than useless. They lead to great losses of valuable capital, frequently to the total abandonment of good properties, and, worse than all, to a false sense of self-satisfaction that discourages improvement by denying its necessity."

By sampling is understood the final delivery to the assayer of a comparatively small proportion of ore which accurately represents a very much larger volume of the same material. That is to say, in proportion to its quantity, it will contain precisely as much or as little of the gold and silver as a ton will of the rock sampled. The greater the proportion that is taken of the ore body, the more likely it is that it will represent an average value. Ordinarily, metallurgical works which treat ore from many sources, or buy ore from many different people, pay for the ore on the assay value. The proportion that is taken for a sample of the total amount is one-tenth or one-twentieth of the lot; or, if the lot itself is small, say ten tons or under, the whole amount. This proportion that they thus select is crushed fine and thoroughly intermixed.

On the Comstock a grab sample is taken from the carload of ore, which is not thoroughly mixed, and the pieces of which are very far from being uniform in size, and instead of one-tenth or one-twentieth of the lot, the amount grabbed is probably not over half a pound from the carload which weighs nearly a ton. In one case one part in ten, at least, is taken, and in the other one part in 4000. Moreover, in the former case the whole lot is crushed to permit of uniform mixture, but on the Comstock only about eight pounds of the day's samples, of say 100 pounds are taken from the sample box, and that, too, without crushing or quartering down, for the assayer; in other words, the assayer takes his assay from one part in 48,000.

The manner in which the carman takes the sample from the carload of ore weighing about a ton, is necessarily incorrect, for the carload itself is not an intimate mixture, which is required in good sampling, and the quantity that he takes, as stated, is but one part in 4000. If, during the twenty-four hours, he has thus taken say from 100 cars or 200, or whatever the number may be, the final result is the same small proportion of the total amount which he is supposed to be sampling. Nothing can be properly sampled which is not homogeneous, unless one gets a proper proportion of each component part.

In these ore cars the ore is generally in a finely divided state, but the waste rock is coarse. No man being asked to sample ore will take one or two pieces of the coarse as representing the mass, for he knows that it is not ore; he cannot help knowing it, and it is not in human nature for him to grab up masses of waste rock when he is told to sample ore; he only does it in cases where it is intimately intermixed so that he does not know one from the other.

The manner in which the sample for the assayer is prepared is also incorrect, also supposing that there are considerably more than eight pounds in the box. A correct sample of the whole quantity which is in the box can only be obtained when the whole amount is reduced to powder, or, at least, in small pieces which will permit intimate intermixture. But eight pounds out of, say, 100 pounds would be sufficient if the ore was in a proper mechanical condition, as stated. But in the manner in which this sample of eight pounds is taken from the box, the same errors may creep in as in taking the sample from the carloads, possibly even greater. It is true that a man, having 100 pounds properly spread out, might sort out a closer proportion of poor and rich ore than the car sampler did, but, as stated, it is a vicious sampling of a vicious sample, and no subsequent result obtained from an assay, no matter how made or how correct, can be depended on as showing the value of the ore body which it is attempted to sample.

It may be said here that most of the milling on the Comstock is done by custom mills, and this makes it necessary for the mine owners to take samples before the ore reaches the mill. The millman for his guidance takes samples from the pulp as it comes from the batteries. In most cases throughout California and Nevada, where the mill and mine are under one ownership, assays are made only from the battery pulp. That the mill sample on the Comstock is far better than the haphazard car sample may be easily seen. The ore is broken down in the mine, thrown down an ore chute, put in the cars, goes to the ore bin at the mine, then to the ore cars of the railroad and finally is dumped into the ore bins at the mill, where it is broken up by the rock breakers before it goes to the batteries. In all this handling the ore necessarily becomes thoroughly mixed.

An analysis of the assay value by railroad and battery samples compared with the bullion returns on the lot of 338.72 tons of Hale & Norcross ore worked at the Brunswick mill in October, 1895, furnished an illustration of the unreliability of samples, even of battery samples, if improperly taken. While there was extracted of the silver in the ore 66.01 per cent by railroad sample and 73 per cent by battery sample, there was obtained in the bullion of gold 140 per cent by railroad sample and 153.45 per cent by battery sample. The impossible per cent of yield of gold, even from the railroad sample, will bar one from claiming that the battery sample was too low in gold on account of the gold remaining in the mortar until the final cleanup.

The excessive percentage is due, possibly, to incorrect assay returns. The foreman of the mine testified that the ore was of a different character from what is found elsewhere in the mine and probably contained a larger proportion of gold to silver than ordinary ore. It is well known that when ore contains free gold, large discrepancies may occur in duplicate assays from the same finely powdered pulp.

One of the main discussions before Judge Hebbard was as to the different percentage of bullion obtained from the ore of different mines and even of different ore bodies in the same mine on the basis of the car sample and battery sample assays. An erroneous impression was given to many that this was due to the milling, while in fact it was due mainly to the difference in the relative proportion of gold to silver in the ores and to the difference in the minerals comprised in the ores.

It is more difficult to obtain a high percentage from silver ores than from gold ores, the latter being free and uniting quickly with quicksilver, whereas silver is combined with sulphur and other substances and must be first reduced by chemicals before it will unite with quicksilver, and the gangue of the ore often acts upon the chemicals used, destroying their efficacy. In some of the mines the bullion consists of one-third gold and two-thirds silver, whereas in others the proportion is reversed; in some cases even 80 per cent being gold. Therefore the per cent of extraction of gold and silver may be equal, but the total percentage will vary. From 80 to 90 per cent should be obtained of the gold and about 45 per cent of the silver in ordinary work on the Comstock.

To illustrate this, take one-ton samples of $40 rock from two Comstock mines, one with 80 per cent of gold and 20 per cent of silver, and the other 30 per of gold and 70 per cent of silver. Suppose that in working them there is obtained in each case 80 per cent of the gold and 45 per cent of the silver. From the first lot, containing $32 in gold and $8 in silver, we would obtain $25.60 in gold and $3.60 in silver, or a total of $29.20, which is 72 per cent of the $40. From the second lot we would obtain $9.60 in gold and $12.60 in silver, or a total of $22.20, which would only be 54 per cent of the $40 in that ore. This accounts for the different percentages obtained in the yield from different mills from working ore from different bonanzas.

In the Comstock there were different bonanzas, or ore bodies, which differed as to the gangue as well as to the minerals composing the ore. The presence of rebellious metals and the difference in the mechanical condition of the ore bodies make it almost impossible to fortell closely what the yield in per cent will be from any given ore body in comparison with any other ore body or even sometimes of different portions of the same ore body.

This may be illustrated by the results obtained by Mr. Janin from two lots of slime worked by him on the Comstock and referred to by Raymond in his "Mineral Resources for 1872." From one lot the percentage of gold extracted was 23.30 and of silver 35.68. From the other lot he obtained 76.28 per cent of the gold and 87.06 per cent of the silver.

It may be interesting to note here some of the points in Judge Hebbard's decision upon which the case was sent back for rehearing.

There were delivered to mill by the Hale & Norcross 88,887 tons gross weight. Based on this weight the gross value of the ore was $3,505,361, or an average assay value of $39.43 per ton by car sample. Allowing for 6 per cent moisture, there was only 83,553.78 tons dry weight, which, at $39.43 per ton, gives a gross value of $3,294,525. The yield in bullion, based on wet weight, was 52.11 per cent of the gross value by car sample; based on dry weight, it was 55.45 per cent of the assay value. The estimated value of the dry ore by car sample being $3,294,525, and allowing that 5 per cent of the value went off in slimes (the per cent of weight going off in slimes would have been greater, but the slimes are usually poorer, especially in gold, than the original ore), there went into the pans ore containing $3,129,798.

Judge Hebbard decides that there should have been returned in bullion $2,616,491. To obtain this would have required an extraction in the pans of 83.6 per cent of the car sample assay, which he admits the testimony showed to be always too high.

Supposing the car sample assay of the Hale & Norcross ore to have been $5 too high, and Judge Beatty also says that the testimony shows that they are always too high (referring to Mackay's testimony that they unually run $8 to $10 per ton above the real value), and consequently that the real value per ton was $34.43; then the gross value of dry ore would have been 83,553 tons at $34.43, or $2,876,729. Allowing that 5 per cent of this value ran off in slimes, there would have gone into the pans ore assaying $2,732,892, and the $2,616,491 which Hebbard says should have been returned in bullion, would have required an extraction of 95 per cent in the pans. Judge Beatty assumes that Judge Hebbard has roughly included the yield of the slimes and concentrates, etc., in what should have been the bullion yield. This, however, would still make necessary an extraction of over 90 per cent in the pans, or there would have to be credited to the mill the cost of reworking the slimes, tailings, etc., which would not be covered by the charge of $4.50 per ton allowed as the actual cost of working the ore.

It is necessary for the Comstock millman to extract in bullion at least 75 per cent of the battery assay to make good his guarantee of 65 per cent on wet ore and allow for loss of slimes. Ore is now worked to a higher percentage on the Comstock than was formerly the case, and it is the custom to grind much longer.

The improvement of the working of Comstock ores lies in the direction of working directly the whole amount of ore as it comes from the battery without separating the slimes, and on accomplishing to a great extent by chemical means what is now less perfectly effected by prolonged grinding of the ore at an unnecessary expense for fuel, castings and quicksilver, the consumption of the latter being increased by the continuous grinding in the pan.

A better system of sampling is now especially desirable on the Comstock, on account of the working of lower grades of ore, where a slight error may entail a loss by causing the milling of ores that will not pay. It is said that Mr. Keating proposes to put up mills to handle large quantities of this class of ores down on the Carson river as soon as the Hale & Norcross suit is settled. When working low-grade ores the mine owners must necessarily be very careful, for fear of sending to the mill any that will not pay, for the margin between profit and loss is small.

A charge made in the Hale & Norcross case, and one that has too often been made before, is that of causing a great deal of ore that would not yield a profit to the mines to go through the mills simply for the sake of the milling profits.

When thorough, reliable sampling is done, the mill owners will be satisfied, the mining stockholders will be satisfied, and a blot will be removed from the escutcheon of the mill barons of the Comstock.

The remedy is simple and at hand, and only awaits adoption by those in power on the Comstock. Mechanical samplers have been so perfected that their use has given entire satisfaction in other districts, both to the mine owners and the mill owners where custom work is done. The rapidity with which ore is extracted on the Comstock precludes the idea of hand sampling. There need be no objection, however, to mechanical samplers, which can handle any number of tons. These could be conveniently placed at the mine under crushers above separate ore bins, and a given proportion of the ore delivered in cars might be run to the crushers. Falling thence the ore might pass through the samplers, which can be arranged to deliver any percentage required of all the mass passing through them. For instance, ten carloads out of every hundred might be delivered to the crusher, and all of this would pass through the mechanical ore sampler, which would deliver as small a lot as desired—say half a ton—the other nine and one-half tons going on to the mill. From the smaller lot quartered down the assayer would take his sample.

## Notes on Gold Milling in California.

NUMBER XV.

By E. B. PRESTON, M. E. Field Assistant State Mining Bureau.*

SPECIFICATIONS FOR A FORTY-STAMP GOLD MILL (WATER POWER).—MACHINERY.

*Water Wheels and Pulleys.*—One water wheel six inches in diameter, to drive the battery, the wheel to be supplied with a shaft, boxes, collars, gate and nozzle, automatic governor, and a pulley 36 inches in diameter grooved for 1¼-inch manilla ropes.

One driving pulley, 12 inches in diameter.

One idler pulley, 48 inches in diameter, grooved for 1¼-inch rope, and fitted with shaft and boxes.

One slack-tightener pulley, 48 inches in diameter, grooved for 1¼-inch rope, and fitted with shaft, boxes, carriage, track, and counterbalance weight.

The rope for transmission is to be put on in one piece, passing around the idler and slack-tightener (which are to be set on an angle in such a way that they will take the rope from one side of the main pulleys and pass it on to the opposite side of the other pulley), thereby making but one splice in the whole rope, which will be kept in constant tension by the slack-tightener.

One wheel, 4 feet in diameter, to drive the rock-breakers; the wheel to be supplied with a shaft, boxes, collars, gate, and nozzle, and a pulley 34 inches in diameter, grooved for 1½-inch manilla rope.

One driving pulley, 60 inches in diameter.

One idler pulley, 30 inches in diameter, grooved for one 1½-inch rope, and fitted with shaft and boxes.

One slack-tightener pulley, 30 inches in diameter, grooved for one 1½-inch rope, and fitted with shaft, boxes, carriage, track, and counterbalance weight; rope to be put on similar to that for the battery.

One wheel, 36 inches in diameter, to drive the concentrators; the wheel to be supplied with shaft, boxes, collars, gate, and nozzle, automatic governor, and a pulley 16 inches in diameter, grooved for one 1-inch manilla rope.

One driving pulley, 48 inches in diameter.

Forty-stamp battery, stamps to weigh 850 to 900 pounds each, arranged to run in eight batteries of five stamps each, by belts and friction clutch pulleys from battery line shaft.

Eight high cast-iron mortars, single discharge, each to weigh about 5000 pounds; to be planed all over the bottom, and faced where the apron joins on; eight holes to be accurately cored in the base for 1½-inch anchor bolts. Each mortar to have five cast-iron linings. The aggregate weight of these linings is about 500 pounds per mortar.

Eight cast-iron aprons, to be faced where they join on to the mortars, and fastened in place with ¾-inch bolts.

Eight sugar pine screen frames, to have iron facings put on the ends where the keys bear against them; the edges to be fitted with dowel-pins to join them to the inside plate-block.

Sixteen inside plate-blocks, two sets, one to be 6 inches high and the other to be 4 inches high; to be well fitted into the mortars and to have plates fitted and fastened on with brass screws; blocks to be bolted together to keep them from splitting, and to be fitted with iron facings where the keys bear against them, and well fitted to the screw frames.

Eight brass wire screens, No. 30 mesh, to be fastened on to the screw frames with copper tacks.

Sixteen gilt-headed end keys, for screen frames, to be well fitted in place.

Sixteen bottom keys, for screen frames, to be well fitted in place.

Sixty-four foundation bolts, for mortars, to be 1½ inches in diameter by 30 inches long, with hexagon nuts on the top ends and steel keys in the bottom ends.

Sixty-four wrought-iron washers, 4x4x¾ inch, for bottom ends of foundation bolts.

Eight sheets of rubber, ¼ inch thick by 30x60 inches, for mortar foundation. Mill blankets tarred may be used in place of rubber.

Forty chrome steel or cast-iron dies, 9 inches in diameter by 7 inches high, with square base well fitted into the mortars, 10 inches from center to center.

Forty chrome steel shoes, 9 inches in diameter by 8 inches high, with tapered shank 3½ inches in diameter at top end, 4; inches in diameter at bottom end, by 5 inches long, to fit into the stamp-heads by being covered with dry, hard pine ¼ inch thick, this being driven in by being allowed to drop a few times on the bare die.

Forty chrome steel stamp-heads, 9 inches in diameter by 17 inches long, with a conical socket cored into the lower end, 4 inches in diameter at inner end, and 5¼ inches in diameter at the outer end, and 5½ inches deep, and a conical socket cored and actually bored out to fit the tapered end of the stamp stem, 2⅞ inches in diameter at inner end, and 3¼ inches gauge at the outer end, by 6 inches deep. Transverse rectangular keyways are to be cored through the stem-head, 1x2½ inches, for loosening the shoes and stems.

Two steel loosening keys, ⅞ inch thick by 1 inch at the point (2 inches at the head) by 18 inches long, for loosening the shoes and stems.

Forty best refined iron or mild steel stems, turned perfectly true, full length, 3¼-inch gauge by 14 feet long, to be tapered on both ends to accurately fit the stamp-heads. Each stem weighs about 360 pounds.

Forty chrome steel, double-faced tappets, 9 inches in diameter by 11 inches long, with a steel gib and two steel keys accurately fitted in place; both faces to be turned true; tappets to be bored with the gibs in place to accurately fit the stems, and to be counter-bored opposite the gibs by moving the center ¼ inch away and, with diameter ⅛ inch less than the bore, taking a cut ⅛ inch deep. Each tappet weighs 112 pounds.

Eight upper and eight lower guides, with cast-iron frames; guide-blocks to be made of good, dry maple timber and well fitted in place; the guides may also be made entirely of wood.

Four extra quality, mild steel cam-shafts, turned true full length, 5¼ inches gauge diameter by 14 feet long, key-seated for cams and pulley; key-seats must not run through the bearings.

Ten heavy corner boxes, 5¼ inches gauge bore, eight of them to be 12 inches long, and two to be 20 inches long, all of them to be planed all over the bottoms and backs, and furnished with bolts 1 inch in diameter, to fasten them to the battery frame.

Forty double-armed, chrome steel cams—twenty right and twenty left hand—to be made 29 inches long over all, the hub to be 11 inches in diameter and 5¼ inches through the bore; the lifting faces to be 2½ inches wide, and ground smooth, the hubs to be bored to fit the shaft accurately, and properly key-seated and fitted with steel keys, and each marked to their respective places, giving them a combination as follows: Counting from the left-hand side, when facing the battery, throughout the full ten stamps of each cam-shaft, No. 1 cam will drop its stamp first; then Nos. 8, 4, 10, 2, 7, 5, 9, 3 and 6 consecutively. This is the order; 1, 4, 2, 5, 3. Each cam weighs about 158 lbs. The curve of the face of the cam is the involute of a circle, usually slightly modified.

Four pairs of cast-iron double sleeve flanges, for wood pulleys; flanges to be 36 inches in diameter, and 14 inches through the bore; to be turned all over the inside, where they fit on the wood; the outside flange is to be bored and fitted to the sleeve and fastened with a gib-headed steel key; the hub to be bored and fitted to the cam-shaft and fastened with a steel key.

Four wood pulleys, 72 inches in diameter by 17 inches face; to be made of best kiln-dried sugar pine, and all joints to be filled with white lead in oil; the cast-iron flanges to be well fitted on and bolted with twelve ⅝-inch bolts.

Eight wrought-iron collars, for cam-shaft, 5¼-inch bore, fitted with two steel set-screws in each.

Eight wrought-iron jack-shafts, 3 inches in diameter by 60 inches long; black finish.

Sixteen cast-iron jack-shaft side brackets, with four lag-screws, ⅝ inch by 6 inches, for each, to fasten them in place.

Forty open latch sockets, lined with leather.

Forty wood finger-bars, to be fitted and bolted to the above sockets, and furnished with wrought-iron caps and handles.

A complete set of water-pipes for a battery of forty stamps, with all fittings, cocks, and connections.

*Bolts and Washers for Battery Frame.*—Six brace rods, 1¼ inches by 25 feet, 7 inches between two nuts; 6 brace rods, 1¼ inches by 12 feet, 6 inches between two nuts; 26 bolts for mudsills, 1x30 inches; 24 bolts for yokes, 1x28 inches; 24 bolts for yokes, 1x52 inches; 48 bolts for guide girts, 1x32 inches; 4 bolts for knee beam, 1x28 inches; 36 splice bolts for mudsills, ⅞ inch, 16 inches between head and nut; 12 splice bolts for tail girt, ⅞ inch, 9½ inches between head and nut; 32 bolts for mortar-blocks, 1 inch, 59 inches from point to point; 64 bolts for mortar-blocks, 1 inch, 65 inches from point to point; 24 joint bolts for posts, 1 inch, 35 inches between two nuts; 6 joint bolts for knee posts, 1 inch, 45 inches between two nuts; 6 joint bolts for knee posts, 1 inch, 35 inches between two nuts; 24 joint bolts for knee beams, 1 inch, 43 inches between two nuts; 10 joint bolts for tail girts, 1 inch, 21 inches between two nuts; 24 cast-iron washers for 1¼-inch rods; 514 cast-iron washers for 1-inch bolts; 72 cast-iron washers for ⅞-inch bolts; 24 cast-iron washers for ⅝-inch bolts; 40 sheet-iron washers, 3½ inches square by ⅛ inch thick, for 1-inch joint bolts.

*Battery Line Shafting and Pulleys.*—One shaft, 5½-inch gauge by 18 feet long, properly key-seated; one shaft, 5-inch gauge by 15 feet 6 inches long, properly key-seated; one shaft 5-inch gauge by 17 feet long, properly key-seated; one shaft, 4-inch gauge by 17 feet long, properly key seated; two shafts 3-inch gauge by 10 feet 6 inches long, properly key-seated; two face couplings, 5-inch gauge, properly fitted and keyed in place; one face coupling, 4-inch gauge,

FIG. 4. CORRAL HOLLOW

FIG. 5.—CORRAL HOLLOW AND SURROUNDING COUNTRY.

(See page 161.)

* Bulletin[No. 6, California State Mining Bureau.

properly fitted and keyed in place; two face couplings, 3-inch gauge, properly fitted and keyed in place; two babbitted boxes, 5½-inch gauge; three babbitted boxes, 5-inch gauge; two babbitted boxes, 4-inch gauge; two babbitted boxes, 3-inch gauge, all of the above boxes to be made of the same height, planed all over the bottoms, with drip cups cast on to the sides, and furnished with suitable bolts to fasten them to the 16-inch battery knee beams; two collars for 5½-inch shafting, with two steel set-screws in each; four friction clutch pulleys, 48 inches in diameter and 16½-inch face, complete, with levers and connections; pulleys to be fitted to line shaft in their proper places, with phosphor-bronze bushings, the drivers to be properly keyed on with steel keys; one pulley, 6 feet in diameter, grooved for three 1¼-inch manilla ropes, pulley to be well balanced and keyed to the shaft with a steel key.

*Water-Pipes.*—Sufficient 3-inch pipes and fittings to connect battery pipes with feed-water tanks.

*Traveling Hoist.*—One traveling crab, with track-iron and rails, to extend full length of battery.

One 2-ton Weston's differential chain-block.

*Ore-Feeders.*—Eight Challenge self-feeders, complete, for batteries, with all connections.

*Ore-Bin Gates.*—Eight ore-bin gates, 18x24 inches, for fine ore, with guides, racks, pinions, shafts, boxes, hand-wheels and bolts.

Three ore-bin gates, 24x36 inches, for coarse ore, with guides, racks, pinions, shafts, boxes, hand-wheels, and bolts.

*Sluices and Aprons.*—Eight cast-iron aprons, 54 inches wide by 56 inches long, to be fitted under the lip of the mortar apron.

Eight silver-plated copper plates, 54x56x⅛ inches, to be made of best Lake Superior copper, and to have one ounce of silver per square foot; plates to be fitted into the cast-iron aprons, and fastened by strips of wood on the sides, which are bolted to the sides of the apron.

Eight cast-iron sluices, 54 inches wide by 12 feet long, to be made into two sections and bolted together by flanges, the lower section to have a quicksilver trap or trough cast on to the end, extending the full width of the sluice, and to have a connection made for a 2-inch pipe to conduct the pulp to the dividing tanks, and thence to the concentrators.

Twenty-four silver-plated copper plates, 54x48x⅛ inches, to be made of best Lake Superior copper, and to have one ounce of silver per square foot; plates to be fitted into the sluices, overlapping at the joints, and to be fastened in place in the same manner as those in the apron.

There are to be eight silver-plated copper shaking-tables, one for each battery, placed below the apron-plates. These tables consist of a light iron framework suspended upon movable springs. This table is given a longitudinal oscillation by means of eccentrics.

*Dividing Tanks and Pulp Pipes.*—Eight cast-iron dividing tanks, 10 inches long by 8 inches wide by 6 inches deep, with 2-inch pipe connection in one end and two 1½-inch pipe connections in the other end, each to have a wooden swinging tongue put in so as to direct the pulp to either of the 1½-inch pipes, or a part to the one and a part to the other. The tanks are to be connected with the sluices by 2-inch pipes, and with the concentrators by 1½-inch pipes.

*Inside Plates and Blocks.*—Three wooden blocks for each mortar, to be 3 inches, 4⅛ inches and 6 inches high, respectively, to be fitted into the mortars under the screw frames; each block to have iron facings, fitted in flush and screwed on where the keys come, and to have a silver-plated copper plate bent to the proper shape and screwed on with silver-plated brass screws; the copper plates to be made of best Lake Superior copper, 6x50x$\frac{3}{16}$inch, and to have one ounce of silver per square foot.

*Concentrators and Shafting.*—Sixteen endless belt concentrators, complete, with water-pipes and fittings to connect with supply tanks. All sulphuret tanks, complete, to be made of good redwood lumber.

One piece of shafting, 2½ inches by 16 feet; six pieces of shafting, 2 inches by 16 feet; three pieces of shafting, 2 inches by 10 feet; eight face couplings, 2 inches, four babbitted boxes, 2½ inches, with bolts for 8-foot timber; eighteen babbitted boxes, 2 inches, with bolts for 8-inch timber; two collars, 2½ inches, with steel set-screws; two collars, 2 inches, with steel set-screws; one pulley, 48 inches in diameter, grooved for one 1-inch rope, and properly fitted and keyed with a steel key to 2½-inch shaft; two pulleys, 6-inch face by 36 inches in diameter, properly fitted and keyed with steel keys to the 2-inch shaft, sixteen pulleys, 4-inch face and 10 inches in diameter, properly fitted and keyed with steel keys to the 2-inch shaft; sixteen loose pulleys, 4-inch face by 10 inches in diameter, properly fitted to the 2-inch shaft, sixteen collars, with steel set-screws for same.

*Rock-Breakers and Shafting.*—Two rock-breakers, 9x15 inches; one piece shafting, 4 inches by 16 feet; one piece shafting, 3½ inches by 16 feet; one piece shafting, 3 inches by 16 feet; one face coupling, 3½ inches; one face coupling, 3 inches; three babbitted boxes, 4 inches, with bolts for 10-inch timber; two babbitted boxes, 3½ inches, with bolts for 10-inch timber; two babbitted boxes, 3 inches, with bolts for 10-inch timber; two collars, 4 inches, with steel set screws; one pulley, 48 inches in diameter, grooved for 1-inch and 1¼ inch manilla rope, and properly fitted and keyed to the 4-inch shaft, with a steel key; three pulleys, 20-inch straight face by 20 inches in diameter, properly fitted and keyed to the shafting.

*Cleanup Barrel.*—One cleanup barrel, 24 inches inside diameter by 48 inches inside length, to be made of cast iron 1½ inches thick, with two discharge openings, 5½ inches in diameter, in the sides diametrically opposite each other, the heads and discharge doors to be accurately fitted; journals to be 4-inch gauge, cast on to the heads; one tight and one loose pulley, 7-inch face by 30 inches in diameter; two babbitted boxes, 4-inch gauge; and driving pulley, 6 inches in diameter by 14-inch face.

*Batea.*—One batea, 48 inches in diameter, with gears and hangers complete, and tight and loose pulleys, 4½-inch face by 16 inches in diameter, one driving pulley, 9-inch face by 21 inches in diameter.

*Machinery for Cleanup Room.*—One clean-up pan, 24 inches inside diameter, with tight and loose pulleys.

One driving pulley, 8-inch face by 16 inches in diameter.

One cast-iron washing-tank, 24x30x24 inches deep, with three pipe connections for drawing off water.

One cast-iron washing-tank, 30x36x24 inches deep, with three pipe connections for drawing off water.

One cast-iron washing-tank, 30x54x30 inches deep, with three pipe connections for drawing off water.

One marble top, complete, for washing-tanks.

One side washstand, with pipes and fittings.

All pipes and fittings necessary to bring water to the clean-up pan and washing-tanks.

*Retort and Melting Furnace.*—One retort, 10x36 inches, inside dimensions, with amalgam trays, condenser, catch tank, furnace front, bearers, bars, smokestack, and base plate, guy rods, dampers, binders, and all pipes and fitting to bring water to the condenser.

One cast-iron melting furnace, complete, with doors, grate-bars, bearers, cast-iron shell, and damper.

Two bullion molds for 500 and 750 ounces.

Four black-lead crucibles, No 16, with covers.

One crucible tongs for No. 16 crucible.

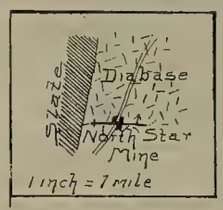
One skimmer for bullion.

*(To be Continued.)*

## Some Notes on "Crossings."

Written for the MINING AND SCIENTIFIC PRESS by HERBERT C. HOOVER.

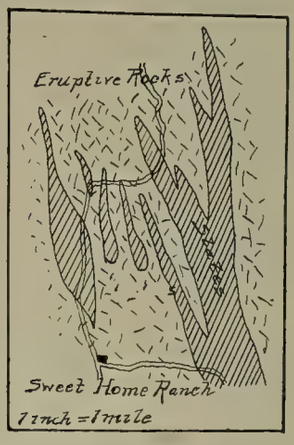
There occur in a number of mines in the Grass Valley and Nevada City districts certain local variations in the country rock known to the miners as "crossings." The term "crossing" is very unsatisfactory, because it is used to indicate almost any interruption in the course of the vein, whether it be a fault, dyke or cross vein. But there is a peculiar form of crossing which affords many points of interest, whose origin seems to lie in none of the above causes. They are lenticular masses or streaks in the country rock, crossing the vein at irregular angles, are usually softer than the inclosing rock, schistose in structure, vary from a few inches to several feet in thickness, and extend along the dip of the vein from a few feet to the entire depth of the workings. They present many features of importance to the miner, for not only do they afford an easy channel for cross-cuts, but they may control the extent of the pay chute, or even the entire vein filling.



The most typical of this variety of crossing are those of the North Star mine at Grass Valley, called to my attention by Mr. Louis Janin.

In the North Star mine there are a number of these crossings, there being as many as four in one level. Some of them extend only a short distance below and above a level, while others extend through several levels, and one, the west crossing, extends throughout the workings, about 2800 feet, and forms the western limit of the ore body.

On approaching the crossing the quartz usually shows one of two phenomena, either splitting into a network of stringers or ending abruptly, but in either case continuous on the opposite side. The crossings thus form either a breccia of country rock or a "horse" in the vein. The network of stringers sometimes extend into the crossing so as to make it profitable to remove the crossing itself for a few feet on either side of the vein, and giving rise to the suspicion that a cross-vein has been encountered.



There are many current opinions as to the origin of these crossings, some contending them to be streaks of decomposition, or that they are the result of shearing by faulting. But neither is tenable in the North Star case, because either theory would necessitate that the crossing extend from the surface to considerable depth; and, moreover, the vein shows no indication of displacement. Therefore, it is necessary to seek some other explanation, bearing in mind that the crossings are older than the fissure, for they are brecciated by the quartz; that they are mere lenses in the country rock, and not due to either shearing or decomposition.

The North Star vein is a true fissure vein, having an east-west strike, a dip to the north of about 20°, and for the most part in diabase porphyrite.* The vein has been worked for 2800 feet along its dip.

From Smartsville Folio U. S. G. S.

From the cut herewith presented it will be seen that the rocks in the vicinity of the North Star mine are of two formations, slate and diabase porphyrite. The contact between them runs almost north and south, and passes near the west end line of the North Star ground. The diabase porphyrite is of igneous origin, and has been intruded up through the slates,† shattering them, forcing long dykes and tongues into their fissures and sometimes completely enveloping large or small masses. Splendid examples of such formation on a large scale occur at Sweet Home Ranch, ten miles south of Grass Valley. And Mr. Lindgren has noted the occurrence of such inclosures of slate in the Ophir district, near Auburn.‡

AFTER SMARTSVILLE FOLIO, UNITED STATES GEOLOGICAL SURVEY.

I have microscopically examined slides from some of the North Star crossings and find them to be schists, metamorphosed from slates, which, in connection with their close proximity to the area on the west, and their general parallelism with its strike, make it quite positive that they are merely included masses of these slates.

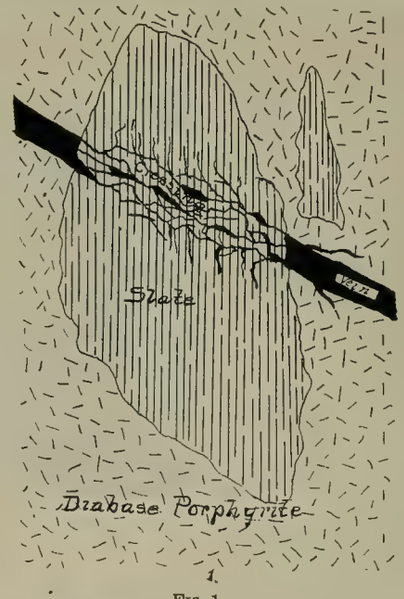


FIG. 1.

FIG. 2.

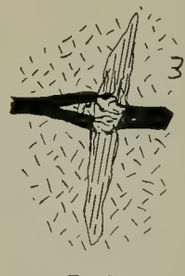

FIG. 3.

Fig. 1.—Section along dip of vein perpendicular to its strike.
Fig. 2.—Section along plane of vein.
Fig. 3.—Section along strike of vein perpendicular to its dip.

IDEAL SECTIONS TO SHOW OCCURRENCE OF SLATE CROSSINGS.

The character of the fissure varies in passing from

*W. Lindgren, Smartsville Folio. Text U. S. Geological Survey.
†Turner, 14th Am. Rep., U. S. Geological Survey, p. 472; Lindgren, 14th Am. Rep., U. S. Geological Survey, p. 253.
‡ 14th Am. Rep. U. S. Geological Survey, p. 253.]

the hard, massive diabase to the softer, more blocky slates, much the same as fissures in different country rocks. Mr. Lindgren,[7] in discussing the character of Sierra fissures, says: "Different rocks influence the character of the fissures to some extent. In massive rocks they are apt to be straight, clear cut and well defined, in slates and serpentines there is often a tendency to splinter into a network of cracks and fissures extremely small, but often rich." When the North Star fissure passed through the hard, massive diabase it was clean cut and afforded an open channel for circulation of vein-filling solutions, but where it cut the more blocky slate inclusions the fissure became a network of small veins, thus impeding circulation or checking it altogether, as at the west crossing. Much the same phenomena might be produced by dykes into a slate country rock, the fissure forming after the dykes.

Movement along the fissure probably faulted the lenses so that the hanging wall portion does not hang directly opposite its foot wall end. In such extensive masses as the west crossing the small exposure along the vein does not show any development, and information is hardly available in the smaller ones. At any rate, the movement has not been extensive, and its greatest effect, probably, was to scatter the crossing debris, some to each side of the crossing itself, thus accounting for the fact that the vein often splits or "raises" around a "horse" before reaching the crossing proper. (See Fig. 3.)

Where the crossings have a limited length along the dip of the vein their effect was much that of a "horse," and the solutions had no difficulty in passing around the ends of this streak of debris in the fissure, but when they are of such general extent as the west crossing they become of utmost importance.

The importance of such a crossing to vein formation lies in its bearing on the distribution and extent of ore bodies in the vein, or even of vein matter in the fissure. That this is of no little consequence is seen from the fact that the plaintiff in the case of Carson City Mining Co. vs. The North Star Mining Co. contended that inasmuch as the west crossing represented the extent of quartz in the vein, it marked the west limit of the vein, and seeks to have the end lines of the North Star readjusted on that basis.

The importance of this particular variety of crossing to the miner lies in the fact that they are often mistaken for faults when they are of considerable thickness and show no well defined walls, and useless crosscuts are run, under the impression that the vein is "thrown." In reality in such cases, not uncommon, the vein is to be found by drifting on the strike of the vein until the crossing is passed, as if it were a dyke. To distinguish between a slate lens and a real fault requires a close study of the country rocks around the mine, and their relations to each other.

In conclusion, then, I think it is evident that some of the crossings are slate inclusions in the prevalent country rocks, and perhaps dykes into slates might produce much the same phenomena; and that it is important that the crossings of every mine be thoroughly understood in order to more fully determine the extent of any ore body; and that they may be distinguished from faults and the expense of crosscutting avoided.

## His Conscience Troubled Him.

G. W. Richardson, secretary of the Nelson Hydraulic Mining Co., received the following letter recently. It bore the postmark of one of the large cities in the United States and was registered. The contents referred to were nine small pieces of gold of the value of possibly $5. The writer evidently is an honest man, for this is the only case on record where gold dust, washed probably merely to see if there was anything in the gravel, or out of curiosity, has ever been returned to the owners of the ground. Mr. Richardson is seriously thinking of having the gold made into a signet ring and presenting it as a token of the company's appreciation to the man who returned the dust:

*Nelson Hydraulic Mining Company*—DEAR SIRS: I wish to return you the contents of this letter, which I feel it is my duty to do. I did not stop to think, at the time I took it, that I was doing wrong. I beg you to forgive me. I took eleven pieces, and I lost two. When you receive this please drop me an answer.

January 21st, 1896. —Nelson, B. C., Tribune.

THE MINING AND SCIENTIFIC PRESS, published in San Francisco, California, presented to its readers in its issue of the 8th inst. a fine half-tone engraving of the Homestake Company's mill, Lead. This is the oldest, and probably has the largest circulation of any mining journal in America, and in commenting on this great corporation's mine in South Dakota, it speaks with a sense of pride while saying: "It is interesting mainly as the mill of the old reliable Homestake, owned largely in this city [San Francisco], and which last week paid its 120th dividend, making a total of dividends paid of $5,748,000." Black Hills Mining Review.

## Mines, Miners and Monopolies.

Written by J. A. EDMAN

NUMBER VI.—*Concluded*

While loudly proclaiming their indifference to mineral lands, as such, and professing to claim only the agricultural land covered by their grants, the Southern Pacific, in common with other land-grant companies, has for years been actively at work with the specific purpose of absorbing as much as possible of the mineral lands of California, of which every step in their programme bears abundant testimony. The prospective value of the mineral land already patented or likely to be patented to the Southern Pacific Company, under the present rulings of the Interior Department, can be estimated by an analysis of the land grants controlled by the company in California. According to the statement of the Commissioner of the General Land Office, made July 1st, 1894, they are as follows:

| | *Acres granted.* | *Acres Patented.* |
|---|---|---|
| To Central Pacific Company..... | 1,638,000 | 491,000 |
| To Cal. & Oregon R. R. Company | 3,724,000 | 1,730,000 |
| To Western Pac. R. R Company | 1,100,000 | 450,237 |
| To Southern Pacific Company | 11,964,000 | 2,596,089 |
| Totals. | 18,426,000 | 5,328,216 |

The above shows eighteen and a half million acres granted and over five million acres patented to the company in California.

The extraordinary activity of the General Land Office during the fiscal year ending June 30, 1895, is shown by the following statistics of land certified to and patented to the Southern Pacific Company during that year:

| | *Acres.* |
|---|---|
| In the Central Pacific grant | 100,293 |
| In the Cal. & Oregon grant | 306,692 |
| In the Southern Pacific grant (main line) | 616,728 |
| In the Southern Pacific grant (branch line) | 72,548 |
| Total | 1,105,261 |

The amount of mineral land already patented to the company can only be surmised from the investigations of the Miners' Association. The mineral lands in the odd sections within the limits of the above land grants appear from an unofficial, but very conservative, estimate as follows:

| | *Acres.* |
|---|---|
| In Central Pacific grant | 704,000 |
| In Cal. Pacific and Western Pacific grant | 1,600,000 |
| In Southern Pacific grant | 1,344,000 |
| Total | 3,648,000 |

Assuming that 20 per cent of this land, being 729,000 acres, is now occupied and can be protected by the miners, and deducting this from the above would leave nearly three million acres of the best mineral land of the United States to be absorbed by one railroad company. Granting to the Southern Pacific Company a funding bill, extending their lease of power virtually for one hundred years, the well-known ability of that corporation to originate bold financial schemes would warrant the belief that in the hands of a gigantic mining trust these lands would attain within twenty years a fabulous value, exceeding even the well-watered stock of the parent company and representing more tangible assets than their present bonds. With the added possession of fifteen million acres of agricultural land, who can foresee the future of such a corporation and its influence on our institutions? And knowing the grasp it now holds, what menace will it then convey to our liberties as a people?

The action of the Miners' Association has formed the only serious check to the schemes of the railroad power. Indifferent to the efforts of the hydraulic miner to protect their industry, and fortified in their land policy by the control of the Interior Department, it found itself struck in a vulnerable spot by the efforts of the mineral lands committee of the association to prevent the wholesale absorption of the mineral lands. Consequently, when, as before stated, active steps were taken to oppose the approval by the General Land Office of the so-called free lists filed by the Southern Pacific Company during the spring of 1895, the organs of the company began their attacks upon hydraulic mining, in line with their old policy of disrupting by sectional prejudices, and in the hope of sowing dissentions in the association, among which many influential members were hydraulic miners.

Under the Caminetti bill many small hydraulic mines had gone into successful operation, and the Debris Commission had by its just but firm administration proven its title to existence and the practicability of pursuing this branch of mining without danger to the general well-being of the State. It had also demonstrated that the great majority of California miners, as law-abiding citizens, had accepted the situation in good faith, and were ready and generally able to provide for restraining the debris from their mines. A few of the larger companies possessing mines near the main streams, and especially on the Yuba river, where the expense of restraining the debris was almost prohibitive, and where millions of tons of tailings already in the river beds should be held back so as not to affect seriously the navigation of the rivers below, considered that the equities of the situation demanded action by the State and General Government. To meet this condition a bill, previously referred to, had been framed by the association to be submitted to the Fifty-fourth Congress, providing for continuing the Debris Commission and for erecting dams under its supervision. This measure and the classification and segregation of mineral lands under the modified Idaho-Montana bill, were among the most important matters acted upon by the Miners' Association in convention in San Francisco on October 14th, 1895.

We have at least three able and conscientious men in the House, and our Senators are men of experience, judgment and high reputation; they should all be impressed with a full sense of their duty to their State, as well as to the Union, in the impending conflict. Any bill prepared and introduced in the present Congress by the friends of the railroad power may justly be suspected as impracticable, or containing a hidden clause intended to operate in favor of the monopoly, or simply to tide over the fight of the railroads to pass a funding bill.

In a contest with a corporation as thoroughly organized for aggression as the Southern Pacific, and fortified by system, experience, wealth and political connections, the miners of California and the Pacific coast in general should not underestimate the strength of their adversary, who can be met and defeated only by the most perfect organization, persistence and activity, wherein the old rule of fighting the devil with his own weapons should not be entirely forgotten.

By the methods usual among fraternal organizations, miners' associations should be created in all the Western States and Territories, as in Oregon, Washington, Nevada, Arizona, Utah, Colorado, Wyoming, Idaho and Montana.

As soon as the Pacific coast States and Territories were thoroughly organized the mining industry could make itself heard and respected in Congress.

The contest of the California miner with the Southern Pacific is not, as has often been flippantly stated by the Eastern press, a sectional quarrel between a few miners and a progressive railroad company. It is one of the first waves of the storm of popular indignation and resistance to organized monopoly and political tyranny, and California's miners may well be proud to be the pioneers in offering the first serious obstruction to the iniquitous land monopolies created and fostered by venal and unwise federal legislation. In this impending conflict all citizens alike are interested, and especially the farmers of our State, who should never forget the Mussel Slough massacre and other crimes of the Southern Pacific against the bone and sinew of the State. Only in reconciling old differences and working side by side for the common good can a path to victory be found by the people, and only by obtaining political power can its latent force be speedily exerted.

It is to the judicial department alone that under present conditions the Western (and especially the California) miner must look for protection against unjust, oppressive and unconstitutional laws and rules of departments. This branch of our Government has remained the most unsullied during our downward progress from the ideal republic of Lincoln to the present Government "of the dollar, by the dollar, and for the dollar," under which so many nations have perished from the earth. It is yet to hoped that even here in California, where the corporations so far have recruited most of their devoted and able servants from the ranks of the legal profession, high-minded, able and patriotic men will arise to espouse and defend the people's cause, which cheering hope the current history of the Miners' Association affirms.

It may be fitting in closing this review of one of the most vital questions in the history of California to quote the words of one of England's greatest poets:

Ill fares the land, to hastening ills a prey,
Where wealth accumulates, and men decay.

J. A. EDMAN.

Meadow Valley, Cal., Feb. 15th, 1896.

## A Human Salamander.

In Phœnixville, Chester county, Pa., is a man, Jacob H. Boyer by name, who may be appropriately termed a human salamander. He is a mason, and his duty is to repair the firebrick lining to furnaces before they are permitted to cool. According to a correspondent of the Philadelphia *Press* he can step into a furnace where the temperature is more than 200 degrees Fahrenheit; he can work there with little discomfort, though the heat singes his whiskers and burns the soles of his shoes. And yet he wilts under the first strong rays of the sun. The capacity of a single furnace is estimated at forty tons of best Phœnix steel every twenty-four hours. The ingots to be heated vary in size, the largest being a foot in diameter and eight feet long. These ingots are heated for the rolls, and it occasionally happens that an accident occurs to the furnace while heated. To take the heat out and cool the furnace would be a great loss of time and a big inconvenience to the company. Right here is where Boyer's wonderful ability to stand the heat comes in handy. He can repair the breakdown without the loss of a moment.

Boyer's shoes have frequently been scorched, and his whiskers and hair have often been burned off to the roots. Once he repaired a smelting furnace while it was so hot that the tools he was using were bent double. Several of the firebrick had fallen out of place and Boyer used a long-handled instrument to put the bricks in place. The job was accomplished only after the greatest difficulty.

# Scientific Progress.

## On a New Kind of Rays.*

BY W. C. ROENTGEN.

(1) On passing the discharge from a large induction coil through a highly-exhausted Crookes, Hittorf, or Lenard tube inclosed in a light-tight covering of black card, it may be observed, in a darkened room, that a paper screen, impregnated with barium platino-cyanide, and approximated to the tube, becomes lit up with brilliant fluorescence—and this equally well, no matter which side of the paper screen may be turned towards the apparatus. Fluorescence is still discoverable at a distance of two metres from the excited tube. It is easy to infer that the discharge tube is the cause of the fluorescence.

(2) There is thus produced some emanation capable of traversing black cardboard, which is impervious to the ultra-violet rays of either the sun or electric arc. It is readily shown by experiment that all bodies are pervious to this influence, although in very different degrees. Thus paper is very transparent. The fluorescent screen lights up brightly behind a printed book of 1000 pp. Fuorescence also occurs behind two packs of cards. A single sheet of tinfoil casts a hardly perceptible shadow. Thick blocks of wood (2 to 3 cm. thick) are but slightly opaque. A plate of aluminum, 15 mm. thick, even allows some of these rays, which I term "X rays" to pass through it, and determine feeble fluorescence. Glass is opaque in proportion to the amount of lead which it contains. Ebonite, of the thickness of several centimeters is traversed by the rays. When the hand is held before the fluorescent screen, the bones exhibit themselves by shadow, surrounded with only a faint shadow of the flesh. Water, bisulphide of carbon, and other liquids are transparent. Thin plates of gold, silver, platinum, copper, and lead, are somewhat transparent. Platinum .2mm. thick is somewhat transparent; silver and copper are more transparent. Lead 1.5mm. thick is nearly opaque. White (lead) paint is relatively opaque. The salts of the various metals, whether solid or in solution, behave much as do the metals themselves.

(3) These results suggest the conclusion that opacity for the rays is proportioned to density. However, experiments with equal thickness of calcspar, glass, aluminum and quartz showed that density is not alone of importance. The densities of these four substances are about the same; but the calcspar is distinctly least transparent.

(4) Opacity increases with the thickness of the screen. To determine the law, photometrically, a photographic print has been taken from a series of tinfoil slips, partially superposed, so that they are graduated in thickness.

(5) Sheets of platinum, lead, zinc and aluminum were rolled until of about equal translucency. Their relative thicknesses were, thus, 1 : 3 : 6 : 200. It is to be remarked that the transparency increases more rapidly than the product of density and thickness decreases.

(6) Besides barium, platino-cyanide, uranium glass and other bodies exhibit noticeable fluorescence. Of special interest is the fact that photographic dry plates respond to the influence of the rays. It is thus possible to exclude the risks of imperfect ocular observation.

Owing to the penetrancy of the rays through thin sheets of paper, wood, or tinfoil, we may photograph upon a plate inclosed in its dark slide. Undeveloped plates, wrapped up in the usual way, must not be laid for any length of time in the vicinity of the discharge tubes.

It is questionable whether the photographic action of the rays is a direct effect, or is a secondary effect due to the fluorescence of the material of the plate. Films, however, receive the photographic impression readily.

I have not yet experimentally proved that the X rays are capable of producing thermal effects, although it seems probable. The retina of the eye is insensitive to these rays, although experiment has shown that the ocular media are fairly transparent.

(7) After these experiments on relative transparency I investigated the question of the refraction of the X rays. With prisms of 30° of water and bisulphide of carbon, used at such a distance as that a pencil of light was refracted by respectively 10 mm. and 20 mm., there was no apparent refraction of the X rays.

With prisms of ebonite and aluminum there was possibly a slight deviation, indicating a refractive index not exceeding 1.05.

In view of the importance of this question it was subjected to another test. Finely powdered substances only allow a little incident *light* to traverse them, owing to refraction and reflection. But powders are sensibly as transparent to X rays as are the solid substances to which they correspond in equal mass. Powdered rock salt, zinc and silver were used in these experiments, which indicated the absence of regular reflection or refraction.

In accordance with this, large ebonite and glass lenses are without action. The shadow photograph of a homogeneous round rod is darker in the middle than at the edge. And the shadow photograph of a cylinder, having relatively transparent matter toward its axis, shows the edges darker than the middle.

(8) An observation must be noted which, prima facie, contradicts the foregoing statement. A photographic plate was "exposed" behind a black screen, the glass side being turned towards the discharge tube. Applied to the sensitive layer were several blanks of platinum, lead, zinc and aluminum. On development, the blackening was relatively strong againt the platinum and lead, and especially the zinc. There was hardly any blackening against the aluminum. It would appear, therefore, that the three first mentioned metals had reflected the rays. Placing a screen of aluminum between the metal blanks and the plate scarcely modifies these results. However, as the state of the surface of the metals does not affect the results of this experiment, we may infer that the reflection is dispersive and not regular.

As I could discover no refraction, it would appear that the X rays traverse all substances at the same speed.

(9) The orientation of calspar and quartz is without effect on X rays traversing these bodies.

I have not succeeded in observing any deflection of the X rays even in strong magnetic fields.

That point on the wall of the discharge apparatus at which the cathode rays impinge, producing the brightest fluorescence, is the point of origin of X rays. By magnetic deflection of the cathode rays, this point of origin can be moved.

The X rays are also generated by a tube closed with an aluminum plate of 2 mm. thickness. The justification of my use of the term "rays" is afforded by the regularly defined shadow images which can be produced. A pin-hole photograph of the discharge tube, covered with black card, has been made — serving to prove rectilineal propagation.

Interference effects have not yet been recognized. The action of electrostatic force is now under investigation.

It is known that there may exist in the ether longitudinal vibrations. May not these new radiations be of such a character?

* Translated from the *Sitzungsberichte der Wurzburger. Physikmedic Gesellschaft.*

---

PROF. F. KLEINPETER directs attention to a new mining explosive which is coming into use in Austria. It is known as Dahmenite A, and is said to be thirty-three per cent stronger than the best gelatine dynamite, and in consequence of the large volume of gas which it produces (being approximately double that yielded by dynamite) it has a wedging rather than a pulverizing action, resulting in a materially increased fall of lump coal. It can be compressed without losing any of its explosive force, and in this state is claimed to exceed dynamite. A weaker detonator is required to bring it to explosion than is required for any other known safety explosive, and it is better able to withstand the effects of storage. If properly packed no decomposition can take place. The last illustration of the safety with which Dahmenite A can be handled is the fact that the German Board of the State Railways allow it to be carried on any trains.

# Mechanical Progress.

## Look Around a Corner.

Mankind once had an extra eye in the back of his head. It would be a very bold thing to question the wisdom of nature in depriving us of this rear eye, but it does seem as if it would have been just as well to let it remain. There are thousands of ways in which it could be made useful. For example, ladies on the street would not be obliged to turn around in order to study the dress of another lady who had just passed.

A foreign firm of opticians have very considerately endeavored to supply, as far as may be done by mechanical means, the loss of this rear-view eye. They have constructed a telescope which enables the user to look around a corner.

Two tubes that extend horizontally carry an object glass in either end. The eye pieces are placed on an axis at right angles to that of the objective or long tubes. When the observer looks through the small peepholes he sees a different field with each eye. The rays of light from the objects that lie in the field of vision are reflected by means of prisms so that they turn the corner of the right angle. When the tubes are thus extended the observer may stand behind a tree or a wall and reconnoitre from his concealed position. The field of vision is enormously extended. You may study objects at opposite points of the compass with no more trouble than the winking of your eye. The stereo-telescope may be folded up, in which position, being held with the tubes upwards, it enables the observer to look above an object obstructing his view, such as a hedge, wall or crowd of people, or a big hat at the theater.

The stereo-telescope should be a useful instrument in the hands of a spy or a sharpshooter. Detectives would also find it valuable. If the police could be provided with them they could keep an eye on both the front door and the side door of a saloon at one time. And as for women, with one of these implements in her hand, she would never have to turn her head to see the cut of that other woman's gown or the trim of her bonnet.

## A One-Man Power Crosscut Saw.

When a crosscut saw is operated by hand it is customary to put a man at each end, and they pull on it alternately. But when one man tries to manage it alone he has trouble. The farther end sways inconveniently. There isn't quite enough downward pressure to make a good cut. And when the blade is pushed away from the operator it is liable to bend, or "buckle." But E. Bliss of Sorrento, Fla., claims that he has found a way of overcoming these difficulties. On the farther side of the log which is to be cut, he says, he drives a stake into the ground, and attaches thereto a stout cord and a coil spring. This takes the place of the other man and pulls the saw back every time. Mr. Bliss does not say how long a spring is necessary to give a play of four or five feet, but he says that he allows for a "tension of about five pounds, and an elongation equal to the length of the stroke." As the cord which holds the spring is fastened to the stake close to the ground, there is a slight downward strain on that end of the saw.

## The Fiddle Drill.

The elaborate carving on the new building of the New York Clearing House Association necessitated considerable use of the "fiddle drill." This drill is of peculiar interest, inasmuch as it is one of the oldest stone cutting tools in existence. It is said to antedate Greek sculpture, and is in use to-day in about the same form as it was 2,000 years ago. As its name implies its action resembles a fiddle. The drill is of two pieces. In one hand a carver holds the drill stock, which is like a carpenter's brace, except that it is straight instead of having a crank. In the other hand he holds the "bow," which is strung with a brass wire and which is given a turn around the drill stock.

To use the drill the carver places the drill stock against his breast, holding it with his left hand, and with his right he draws the bow back and forth, fiddle fashion. This imparts a rotary motion to the drill stock, and the drill is ground to cut in either way it turns. The fiddle is used in the finest work, in crevices where the sculptor could not reach with his chisels and hammer without endangering the carving. About the first thing an ingenious Yankee would say on seeing the "fiddle drill" work would be: Why couldn't a power drill of some sort be used for that kind of work, something like the dentist's drill? But carvers say that pneumatic drills and various types of stonecutting tools have been tried, but none found able to supersede the "fiddle."

## Fog Horns.

Before a great while steam fog-signaling machinery will probably have become obsolete in the United States, and compressed air apparatus, with which satisfactory experimental results have latterly been achieved, will take its place. Trials were made a few months ago at the Staten Island lighthouse station, near New York, and also on board one of the lightships off the New Jersey coast, with oil engines driving air-compressing machinery for working the fog horns there, and it would seem, from all accounts, that these installations have proved themselves all that was expected. The greatest advantage, perhaps, which a compressed air fog horn outfit offers is the quickness with which the sound can be made. Under the old method it took from forty-five to sixty minutes to light the fires under the boilers for the generation of the steam to blow the horns. The lighthouse keeper, as soon as he saw the fog coming, lighted his fire and prepared to get a full head of steam on. This he was obliged to do several minutes before the fog closed down. Sometimes it came rapidly and surrounded him long before he could get the signals working. Now, in five minutes, air can be compressed in the tank, and a blast of maximum force can be given immediately. The tank is left full of compressed air after it is used, and contains enough to keep the horn going for ten minutes. The horns can be started before the fog rolls down upon the keeper and kept blowing steadily until the fog lifts. The power can readily be shut off during any temporary lifting of the fog, while formerly it was necessary to keep the fires up for a long time so as to be sure of being in readiness should the fog roll down again.—Cassier's Magazine.

## Glue Joints in Belts.

In regard to joining leather belts, a correspondent writes to the *Woodworker* and says: I have always had the best results by using common carpenter's glue, such as we use in the shop. I mended an old belt that drives a pony planer. The driver is thirty-two inches, the driven ten inches, centers about eleven feet, and the belt has to be crossed. There are eight splices

in this belt, all glued, and not a rivet in any one, as I consider rivets in a belt a perfect nuisance, and of no use whatever, except to weaken the belt wherever the rivets are put through. I also used a glued belt on the under head of a moulding machine and on the side spindles.

I have used glued belts on matcher-head spindles and always with the best results. The reason so many fail in their efforts to produce the best results is because they do not give enough attention to the details. My modus operandi is. Scarf the ends with a plane and make a good length of splice. Have all nice and equal, so it will be same thickness as the rest of the belt when glued. Here is where the secret lies to make it hold: Before gluing give all the ends a sizing of thin glue, in order to thoroughly fill up the pores in the leather. Let this get perfectly dry, then glue in the ordinary way, and let the glue get good and dry before using. I always give such a joint a good dose of neat's-foot oil to limber it up. The belt referred to has been in use now two years, and only repaired once with a new lace. Experience has taught me it is money in pocket to make all repairs as thoroughly as possible.

# Electrical Progress.

## Range of Speed in an Electric Motor.

In an electric pumping plant which was put in operation during the past year, the requirements of the situation seemed to call for a considerable variation in the speed of the pumps. A shunt motor of 40-horse power, wound for 500 volts, was used to drive a duplex pump of 500,000 gallons capacity. A speed reduction of 30 per cent was required.

Evidently the speed reduction might be obtained by inserting a resistance in series with the armature of the motor. By this method, however, the total power required at the reduced speed would be substantially the same as at full speed, the portion not required to drive the motor being wasted in the resistance box. For some purposes this would not be objectionable, but for continuous pumping the loss of efficiency involved is not admissible.

Another method of varying the speed is by changing the strength of the field magnets. If this can be done by strengthening the magnets, there is no objection; but in many machines the field cores are so nearly saturated that this will avail only to a slight extent. By weakening the field magnets an increase of speed is produced, so that if the gearing be altered in the proper manner the required variation may be obtained. The difficulty which presents itself in this case is the increased liability to sparking at the commutator when the field strength is diminished.

In order to determine whether in this particular motor the speed variations could be produced by weakening the fields, tests were made which gave the following results:

| Number of Tests. | Electrical Horse Power Supplied | Net Horse Power | Efficiency of Motor and Pump Combined | Total Pressure Pumped Against | Revolutions of Pump | E. M. F. at Field Terminals |
|---|---|---|---|---|---|---|
| 1. | 15.42 | 9.45 | 61.3 | 48.0 | 33.5 | 500 |
| 2. | 16.75 | 11.02 | 65.8 | 50.0 | 37 5 | 400 |
| 3. | 20.77 | 13.73 | 66.1 | 52.5 | 44 5 | 300 |
| 4. | 30.15 | 21 86 | 72 5 | 111.0 | 33.5 | 500 |
| 5. | 38 86 | 28.05 | 72.2 | 106.0 | 45.0 | 325 |

The net horse power is the power consumed in forcing the water and was calculated from the gauge reading and suction lift, together with the dimensions and revolutions of the pump. During the tests the sparking was not at all excessive.

Another series of tests was undertaken to determine what could be done in the way of strengthening the fields. For this purpose the field coils were connected in parallel and an adjustable resistance was placed in series. The following were the results obtained

| Number of Tests | Volts Armature Fields | Volts Armature Fields | Current in Field | Current in Field | Normal Current in Each Field | Reduction of Pump Revolution Per Cent. | Per Cent Increase | Per Cent Decrease |
|---|---|---|---|---|---|---|---|---|
| 6 | 275 | 3 45 | 1 72 | 1 48 | 16 | 2 32 | 0 | 5 0 |
| 7 | 300 | 3 65 | 1 82 | 1 48 | 23 | 0 30 | 0 | 11 7 |
| 8 | 350 | 1 15 | 2 07 | 1 48 | 40 | 0 28 | 5 | 16 2 |

## The Action of Electric Currents on Mine-Surveying Instruments.

By W. LENZ.

In view of the rapid increase in the number of electric railways in the Westphalian coal field, and in the use of electric power under ground, the question of the action of electric currents on magnetic mine-surveying instruments is of such great interest that the author has been induced to conduct a series of experiments. A point underground was selected at a horizontal distance of some 100 yards from the rails of the Bochum-Herne electric railway and 434 m. (1420 feet) below it. There, by means of a Fennel's magnetometer with quartz fiber suspension, a series of observations of variation were made based on a fixed line. The magnetometer was previously compared for a long period with the apparatus in the Bochum Town Park, and the two instruments were found to coincide almost exactly. The first observation, in September, 1895, was made by day, the second by night, when the line was free from current, and the last again by day. While the curve of the day results exhibited great irregularities, that of the night results was perfectly regular and in accord with the magnetic records. The irregularities in quite small intervals of time amounted from 2.7 minutes to 5.4 minutes. As at first it was thought that the deviations might be ascribed to the iron-free safety lamps employed, a third observation was made in the morning, the lighting being effected by a stearine candle. The results were exactly the same as on the first day. As the observations were made at a comparatively large distance from other workings, and as the shaft was 200 yards away, it is evident that magnetic observations can, under such conditions, be only satisfactorily conducted during the night in the absence of the magnetic current. Another source of error is the safety lamp. Composed of various metals, the lamp in a hot condition sets up thermo-electric currents which act on the magnetic needle. In order to obtain information on this point, the author placed six mine surveyors' safety lamps free from iron, one at a time, first in a cold condition, then heated, at the pole of a sensitive magnetometer. Of the six lamps examined, two, when cold, had no action on the needle, while all acted on it when hot. The deviations observed amounted to from 30 to 160 seconds. A new benzine lamp, that had not previously been used, caused a deviation of as much as five minutes. The deviation increased with the temperature of the lamp. A quite new aluminum safety lamp caused the same deviation when cold as when hot. From these results it follows that the mine surveyor, before making magnetic observations with delicate instruments, should carefully test his lamp. The influence of slight magnetic properties may be lessened by holding the light in the prolongation of the magnetic axis. With side lighting great care is necessary.

NIKOLA TESLA thinks that "the discovery which would do most to better our condition would be the demonstration that the earth's electrical charge can be disturbed, and thereby electrical waves efficiently transmitted to any distance without the use of cables or wires." Edison says that "the discovery or invention which would do most to better the conditions of life" would be "the production of electricity direct from coal."

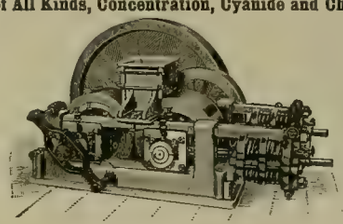
THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS

AND FOR USE IN

Milling and Mining Machinery
Reduction and Concentrating Works
Woolen, Cotton, Paper and Pulp Mills
Rice, Flour and Cottonseed Oil Mills
Sugar and Malt Houses
Distilleries, Filter Presses
Stone, Coal and Ore Screens
Stamp Battery Screens
Brick and Tile Works, Filters
Spark Arresters, Gas and Water Works
Oil, Gas and Vapor Stoves
Coffee Machinery, etc., etc.



Standard Sizes Perforated Tin and Brass Always in Stock.

Main Office and Works: 222 to 240 North Union Street, Chicago, Ill., U.S.A.
Eastern Office: No. 284 Pearl Street, New York

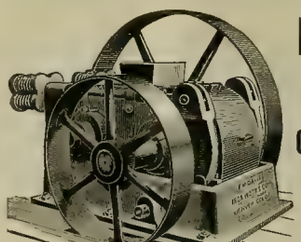
ESTABLISHED 1860. COLORADO IRON WORKS INCORPORATED 1876.
MANUFACTURERS AND BUILDERS OF
Smelting Plants of All Kinds, Concentration, Cyanide and Chlorination Plants.

Stamp Mills, Cornish Rolls, Roasting Furnaces, Hydraulic Sizers, Etc.

WESTERN AGENTS FOR ERIE CITY IRON WORKS ENGINES AND BOILERS.

Improved form of Crushing Rolls.

Crushers, Sampling Mills, Screens and Elevators, Sample Grinders, Etc.



WESTERN AGENTS FOR SMITH-VAILE STEAM PUMPS For all kinds of service.

Our stock of supplies for Mines, Mills and Smelters is complete and we are prepared to fill orders on shortest possible notice.
We have an ore testing plant in connection with our works and we test ore in car lots for concentration and amalgamation, and build mills to successfully treat all classes o lores by latest known methods.
OFFICE AND WORKS, 33D AND WYNKOOP STS., DENVER, COLO.

THE WORLD RENOWNED PENBERTHY AUTOMATIC INJECTOR.

90,000 in Use in the United States.
25,000 in Foreign Countries.
SEND FOR CATALOGUE.
PENBERTHY INJECTOR CO., 130 Seventh Street ..... DETROIT, MICH.
PARKE & LACY CO., Agents, 21 & 23 Fremont Street..SAN FRANCISCO, CAL.

DAVIS CRUSHING ROLLS.

THE F. M. Davis Iron Works Co.
MANUFACTURERS OF
Concentration, Chlorination, Cyanide and Amalgamation Machinery.
Complete Plants for Ore Treatment
High Class Machinery and Experienced Modern Engineering.
WRITE FOR OUR PUBLICATIONS.
OFFICE AND WORKS:
723 to 743 Larimer Street, DENVER, COLO.

FRANCIS SMITH & CO.,
MANUFACTURERS OF
SHEET IRON & STEEL PIPE
FOR TOWN WATER WORKS.
Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.
130 BEALE STREET, SAN FRANCISCO, CAL.
Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared or coating all sizes of Pipes with Asphaltum.

RUPTURE CURED.
Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

# Mining Summary.

## CALIFORNIA.

### Amador.

*Record:* The Cosmopolitan quartz mill, a thirty-stamp mill located between Amador and Plymouth, has been purchased by D. Guttman and will be brought to the Gate mine, where it will have ten more stamps added.

MINING ITEMS.—*Republican:* Negotiations have almost been completed, for the purchase of the Wheeler and Chandler gravel mines, near Pine Grove, to Chas. Haskins, lately from the East, who is also largely interested in the Original Amador and Mayflower quartz mines near Amador City. The price of the combined claims is $25,000.

The Newton copper mine, about 4¼ miles this side of Ione, is once more in operation, after an idleness of about fifteen years. The shaft is free from water and some miners are at work underground.

### Butte.

BANNER GOLD MINE.—A circular to the shareholders states: The directors have secured the services of Mr. J. B. Low as consulting engineer to the company. Mr. Low visited the mine on January 3rd, and reports: "The work of sinking the main shaft is progressing in a satisfactory manner. The rock encountered at the present depth (820 feet) shows a less disturbed condition, and fully justifies our prediction in the report of July 3rd, 1895." Mr. Low again visited the mine on January 29th, and the general manager, Mr. G. H. Evans, cables that he (Mr. Low) is very much pleased with the bottom of the shaft. His opinion is the indications are most favorable. The shaft is now down to about 890 feet.

### Calaveras.

The Gold Hill mine in Spring gulch, north of San Andreas, has been bonded by L. A. Irvine to an English company.

AT COPPEROPOLIS.—*Prospect:* The Empire mine and mill is running steadily.

The shaft in the Kuhn mine in Salt Spring valley is down eighty feet.

The Gold Hunter mine is being reopened and rich ore has been found.

The Angels *Voice* says the Oro Plata gravel mine has put in their new machinery and everything is running smoothly. Eighteen men are at work.

The Roanoke Mining Company will erect an electric plant two miles from the mine, for power at the mine and for lighting the town of Mokelumne Hill. The old Cook ditch has been purchased, it is thirteen miles long, taking water from the Calaveras and Esperanza rivers. This ditch was dug some thirteen years ago at an expense of $30,000 and was used by the Cook brothers to carry on their hydraulic works on the Calaveras river.

The shaft in the Gwin mine is now down 1069 feet. The work of drilling a six-inch hole to tap the old works and relieve them of their water is now in progress. This hole has been sunk to a depth of 150 feet below the bottom of the shaft.

The Esperanza Mining Company has contracted for ten additional stamps, making thirty in all. The chlorination plant will be finished about the first of March. Its roasting capacity will be six tons of sulphurets per day. This will be the second largest plant in the State, the Utica being the largest. The mine is paying well and everything points to an era of prosperity.

At the Hexter mine contracts are being advertised for to cut a tunnel 2000 feet, in sections of 100 feet, with privilege of 100 more. The tunnel is to be 5x7 feet, 6 feet, 4 inches in the clear, and timbered with 8x10-inch sawed timbers.

M. B. Kerr, superintendent of the South Paloma, south extension of the Gwin expects to put on a steam hoist within the next month after which it is his intention to sink 600 feet without crosscutting.

### El Dorado.

(Special Correspondence).—A. J. & R. S. Wilton have bought twenty-two acres, both placer and ledge property, one-quarter mile north of Georgetown. The claim has a two-foot ledge. Work has been started sinking shaft and running longer tunnel.

Dr. I. M. Proctor has bond from Frank Miller for a 4000-foot ledge. Tunnels and five shafts worked years ago will be re-opened at once. The ledge is from eighteen inches to three feet in width.

At the Larkin they are drifting south on the 100; the ore is holding out. This is three miles south, in the Diamond Springs district.

Frank Goyen has bonded to D. H. Jackson the old mine known as the Marguerite, adjoining the Lookin on the north. Active work at reconstruction is already under way.

The Lady Emma, six miles north, in the Kelsy district, has gone below the 300 depth. The new ten-stamp mill is rapidly approaching completion. The ore body at 300 feet is six feet wide and good grade.

Considerable activity in seeking property in the neighborhood of Shingle Springs is developing itself within the past week.

J. J. Antwerp has come from Cripple Creek and bonded a claim on Weber Creek. He is operating a two stamp prospect mill and working a body of fair grade ore.

St. Louis people have begun prospect operations near Greenwood. The shaft is progressing satisfactorily and the prospects are encouraging.

### Mariposa.

*Gazette:* The Dorse or Brooks mine, two miles from Hornitos, is operated by C. E. Stuart of Piqua, O. A large sum of money has been, and much more will be, spent on prospecting the property, which Mr. Stuart holds under a bond. So far the indications are most favorable. The new chlorination works that were constructed some months ago, and have since been standing idle, are less than a mile below the Dorse mine. If the mine prospects all right, the actual work will be taken up on a large scale and will conduce greatly to the prosperity of Hornitos. There are three eight-hour shifts now working in the shaft.

The present pay roll at the Tendron mine is understood to be about $4500 a month.

### Mono.

NEWS FROM BODIE.—In the Bodie the regular prospecting work was done during the week ending February 23d in the 200 and 300 foot levels.

The upraise north drift from the east crosscut on the 200-foot level shows three feet of low-grade quartz in the top.

In the Mono mine the east crosscut from the south drift, 400 level, is still in hard porphyry.

The yield of the Bulwer Consolidated mine for the week ending February 23d was eight tons of ore, assaying $20 per ton.

### Nevada.

Twenty-nine men were laid off at the Manzanita mine at Sweetland last Saturday on account of a scarcity of water.

The Old Home mine at Blue Tent has been sold to the Oro Grande Co. by T. T. Kirkham. The property adjoins the Oro Grande and will be worked through the latter claim. A five-stamp mill will be erected soon.

THE COMMODORE FOOTE MINE.—*Transcript:* Samples of ore taken from the mother lode that crops out from under the lava and gold gravel beds in the vicinity of the Central House, nine miles from Nevada City, are a recent discovery that promises to be an important find. The lode runs northeast and southwest, with an east dip at an angle of 45°. The ledge from wall to wall is over 200 feet wide, and is a contact vein between granite and slate. The footwall shows porphyry and diorite. A working assay by simple amalgamation, of half a pound of the ore, shows that it will safely average between $4 and $5 per ton in free gold and as much more in sulphurets. The mine can be worked by tunnel, and water power can be easily obtained of 1000 feet pressure, if needed.

NEWTON COPPER MINE.—*Ledger:* Work has been commenced at the Newton copper mine, located between the Mountain Spring House and Miller's Station. This mine has been idle for several years. Supt. H. D. Ranlett has been busy hoisting water for over a week, with the intention of having the mine ready for active operation by March 1st.

GARNIER CONSOLIDATED.—A sale has been consummated of the Garnier Con. group of mines, which are situated in Amador and Calaveras counties. This group consists of six claims, three of which are well developed mines. A well equipped ten-stamp mill, run by water power, is also included in the sale. A group of mines located on the mother lode in El Dorado county was also purchased by the same parties, which consists of a syndicate embracing capitalists from New York, New Haven, Conn., Iowa and California. The syndicate has invested $250,000, and it is their intention to commence active operations within thirty days. S. H. Lucas will represent the syndicate on this coast.

*Transcript:* A mammoth quartz ledge has been discovered on the ridge between Nevada City and Washington. The ledge is said to be 200 feet in width, and will yield $4 to $5 per ton in free gold besides sulphurets. It is thought to be a fine low-grade proposition. John Cornwall and A. Isoard, of Nevada City, are the principal owners.

*Herald:* Supt. Murchie of the Old Home Con. Co.'s mines at Blue Tent has ordered a stamp mill of Watson & Nivens, at the Nevada foundry. It is to be five stamps, of 1000 pounds each, and it is expected that it will be ready inside of thirty days. The company has been working the Oro Grande ground through a tunnel, but now they intend to erect a hoisting works and sink 300 or 400 feet at least.

THE COUNTY MINERS' ORGANIZATION.—At the meeting of the Nevada County Mining Association last Thursday afternoon the annual reports of the officers were submitted. They showed the total receipts since organization to be $2030, with $20 still in the treasury. The secretary's report contained the following statement: "The fact remains that the County Association has not done what it should in backing up the State Association, and justice to the latter demands that in future Nevada county should make a showing consistent with the fact that it is the principal gold-mining county in the State, having yielded to date $205,000,000."

The old association then disbanded, for the reason that its constitution failed to conform with the State association's, and its provisions for collecting funds had proved practically inoperative. The new association's constitution provides, among other things, for a complete and effective system of obtaining contributions. Prominent and active citizens in every part of the county have been selected for this work, and it is now certain that Nevada county will be among the most liberal contributors to the miners' defense fund.

Secretary Sonntag was elected an honorary member of the association and addressed the meeting. His remarks were received with unbounded enthusiasm. He reviewed the history of the State Anti-Debris Association, charging that it had never affiliated with the miners. It had been and was still under the control of a coterie of men who were keeping up agitation for the sake of emoluments they derived as paid officials. When the miners wanted aid, anti-miners used their best endeavors to impede their securing favorable legislation. He spoke in glowing terms of the Sacramento Chamber of Commerce and of the San Francisco Board of Trade and Chamber of Commerce for their valuable aid in endeavoring to secure for the miners beneficial legislation. He assured the convention that the whole California delegation were faithfully working for the passage of bills now before Congress.

### Placer.

Last week the superintendent's office at the Red Point mine was destroyed by fire. Maps, papers and valuables about the office to the amount of $4000 were destroyed. Acting Superintendent George Hoffman was out on the pipe line at the time of the fire.

The Colfax *Sentinel* describes the Eureka Consolidated drift mine, a property that it is proposed to develop on the Forest Hill Divide. Felix Chappellett, of the Mayflower mine is the principal owner in the company. The main tunnel to tap the channel is being driven in a canyon about two and a half miles east of the Red Point, 3,914 feet above sea level, and 800 feet below the level of the main divide. The tunnel is equipped with an air compressor which furnishes the power to drive the drills. Work is prosecuted continually, and the tunnel has reached a distance of 400 feet in the blue slate rock. The claim is one of the largest on the coast, embracing over 3,600 acres of land covering six and a half miles of ancient river beds, containing valuable deposits of gold. Though these old river beds are covered with a lava cap from 400 to 800 feet deep, the existence of the deepest channel has been established by the mining done on both ends of the channel near the lines of the Eureka, and by tunnels that have been run into the gravel at different points on the company's property.

### San Bernardino.

J. B. Osborne has opened up a new ledge in the Ord mining district, near Daggett. It is ten feet across, and averages $18 per ton.

### San Diego.

ON THE COLORADO RIVER.—(Special correspondence)—Eight shafts are now being sunk on the two bodies of free-milling ore at Picacho, one of which was discovered on the Mina Rica mine a few months ago and crosses that vein, also the Mars, Venus, West Goshen and Del Mar mines. It is 400 feet wide on the Mina Rica and averages $15. The other body of ore was found a few days ago. It crosses the Helen Mar, Apache, Eastern California, and runs into the San George, and averages about the same. It is from 40 to 100 feet wide. These new bodies of ore are, in addition to the veins, already known to exist in the above mines and add new interest to this camp, now being opened and developed. The work on the eight shafts is being pushed, with flattering results. The shafts are now down from 40 to 100 feet each. The veins are crosscut at every fifty feet. Gold Basin Mining Co., headed by C. B. Richards, vice-president First National Bank, and A. J. O'Conner, receiver of the Consolidated National Bank, San Diego, has secured seven good mines in the White Gold basin, one mile east of Picacho, where it will at once put down three shafts, each 100 feet deep. The company will also put up a forty-stamp mill. With the present developments going on at Picacho, and the good results obtained, the camp is fast coming to the front as one of the most promising mining sections on the coast.

Yuma, Ariz., Feb. 20, 1896.

A deed was filed in San Diego this week transferring the Champion, Golden Bell, Mina de Ore, Fortune, Painted Rock, Mount Pedro, Silver King and Horseshoe mines in Old Picacho district, to the Gold Basin Mining and Milling Company for $1,000,000. The signers of the deed are C. L. Josselyn, A. J. O'Conor, M. O'Conor and C. B. Richards, of San Diego. The deal has been on foot for some time and is believed to mean the beginning of development of the ledges at Picacho.

The Owens mine force at Julian has reached the botton of the shaft and discovered the Cornish pump and the tank that was lost at a former attempt to bail the mine out. Workmen are now engaged at the 250-foot level crosscutting to the Owens ledge and a large force will be put on as soon as the conditions justify.

### Shasta.

*Free Press:* The Tendron Mining Company has incorporated at Redding; principal place of business San Francisco, term of incorporation fifty years; capital stock 100,000 shares of a par value of $5 per share. Stock subscribed, W. Johns 200 shares; S. J. Johns, Alameda, 10 shares; J. R. Johns, Los Gatos, 10 shares; J. M. Haven, Oakland, 10 shares; T. E. Haven, San Francisco, 10 shares.

### Sierra.

C. J. York will soon resume running the lower tunnel—200 feet in—to reach the ledge in his mine a mile and a quarter up Slug canyon.

There are five men working at the Wide Awake drift claim. The old tunnel is in 1200 feet. Being too high, another has been started much lower, which is already 400 feet long.

Twenty-two men are working the Gold Valley mine with good paying rock in sight.

*Enterprise:* The cleanup at the Bald Mountain Extension drift mine for last week's output of gravel was eighty-five ounces, aggregating about $5200 for the past twenty-four days.

### Siskiyou.

Glinn & Co. of Portland, Or., have leased the lower part of the American Bar mine, on Klamath river, and will operate by excavation, the process being similar to that of making deep cuts for railroads. About 150 men will be employed and work will begin immediately. Several carloads of machinery are at Hornbrook, all ready for shipment to the mine and several head of horses were purchased for use in the work. Steam power will be used for hoisting. Over 75,000 feet of lumber will be used for the buildings and the erection of a wing-dam. A ditch has been put in which conducts water to an overshot wheel, and furnishes power to run an elevator, the water afterwards being used to wash gravel.

*Journal:* The mines on Humbug have all been in full blast since the recent rains, as plenty of water has been available. The supply will last for some time yet, but unless we have some heavy spring rains, the season for the miners will be short, as the snow in the mountains is scarce this year.

*Journal:* A new postoffice has been established on Thompson creek—Nolton, in honor of T. J. Nolton, who was instrumental in disposing of the Shinar mine to the Seattle Placer Mining Co., which has given steady employment to about seventy-five men during the past fall and winter. John Wood has been appointed postmaster.

The Red Hill hydraulic mine at Salmon river is now being worked with excellent success, two cleanups made since New Year's yielding about $6000, the second shipment of bullion having been made last week. This mine has a good supply of water, and will continue to yield handsomely during the coming spring and summer months.

The Summerville hydraulic mine in the same vicinity is also yielding rich pay, and will produce considerable gold dust during the spring and summer months.

R. H. Campbell was over at his Quartz valley mine last week, and intends to work the same on a more extensive scale than ever before, having got rid of the English syndicate who failed to carry on the work as agreed upon when bonding it.

Lamb's quartz mill in this place is busy crushing quartz from the Bailey & Carrick mine at Greenhorn. They have about twelve or fifteen tons at the mill.

### Trinity.

*Journal:* One thousand feet of wire cable for the Cis Fse mine, Junction City, was received at the Redding depot this week.

Operations at the Strode mine, near Trinity Center, which has been shut down during the winter, will be resumed March 1st.

Lowden, Van Matre and Garvin, of this county, together with Coffin, Woods, Wellendorf and Herzenger have formed a partnership and located 160 acres of mining land on the Trinity river, near tne mouth of Buckeye creek, in the Minersville mining district.

AT CINNABAR.—At the Altoona in a few weeks the furnace, shut down for repairs, will start up and seventy-two men will be constantly employed. The ore is getting richer and richer as depth is attained, and another shaft 100 feet deep will soon be under way. The furnace is capable of turning out 600 flasks of quicksilver per month.

### Tuolumne.

*Independent:* The Marlee gravel mine, located on the north fork of the Tuolumne river, has been bonded, in the sum of $16,000, to the Mining Development Company, incorporated, with business office at Sacramento. It is bonded by the owners, Messrs. Burns, Longeway and Carter. The ground is covered by a U. S. patent. The corporation has contracted for 3½ miles of ditch from Turnback creek; also, for 5500 feet of 24-inch steel pipe, to carry water to the mine. Thirty-five years ago, 100 men worked there, at one time, the bed of gravel being 200 feet in depth. It is an ancient river channel, and is supposed to be a branch of the main river whose bed is now covered with the lava flow of centuries ago, under what is now known as Table Mountain, extending through Tuolumne, from north to south, and cut from its continuation through Calaveras county by the present Stanislaus river. This channel was tunneled into in numerous places from Shaw's Flat to below Jamestown, and millions have been extracted from the ancient river bed by those fortunate enough to strike it. The Australias, Fraser river, Powder river, Nevada, Montana, and other visionary excitements of "better diggins far away" almost depopulated the richer mining fields of Tuolumne. Add to this, the primitive means of mining, water flooding of tunnels and shafts—going into a bottle in some cases, going above or below the ancient bed, through the adamite lava, thousands of feet—all this by poor men, who had to get a bag of flour on credit or starve. How much was taken out of the New York, near Jamestown, and other places will never be known. Years of litigation in many cases ruined many, and added still more to the list of deserted mines—which, to-day, contain hundreds of millions not yet revealed, and which has added to our abiding faith of many years ago, that Tuolumne's mines have not even been scratched over, much less developed. But, to return to the Marlee. The reason for its abandonment was solid, they could only get water from the Street ditch, which gave up and died years ago. The only supply obtainable then, was Turnback creek. This was barred for many years by the large number of surface mines below, who used and claimed all the water.

The Wallrough quartz mine, a few miles above Sonora, on the mountain road, is also bonded and about to be developed by a Chicago company.

The Parole quartz mine, located near the village of Calders, above Sonora, will be started up again soon, with new improvements.

COLUMBIA MINES.—A partial list of the number of quartz and stamps in that locality: Quartz mines.—Keltz, 15 stamps; Ham & Birney, 10; Star, 10; Graham, (Custom rock) 4; Armstrong, Five Mile Creek, 3; Nervy, 5; Slingerland, 3. Total, 50 stamps. Pocket and gravel mines.—Fox (pocket), Saw Mill Flat; Dorsey mine, Eagle Creek; U. S. Grant; Black Bear; Midnight; Tiger; St. Elizabeth and Exactly mines, in the Star mine locality; the Sublett mine on the main river; the Hyapoo (pocket); and the Admiral Von Tromp.

### Yuba.

The Nevada City and San Francisco men that have the old Flagg mine in charge have several thousand dollars worth of machinery and buildings on the ground and are down to a depth of 250 feet taking out good ore rock. They have leased the four-stamp mill on the Hibbert & Burris mine, crushing about eight tons daily. The old Danebroge has also been

bonded, and is being opened up under the direction of J. C. Campbell. This company is down 500 feet in the old works. The Jefferson and the Pennsylvania, on the northwest, have also been bonded by the same parties, and if the flattering prospects continue, they will work the three mines on one large scale. The Rattlesnake, Dexter and Jupiter locations are also under consideration for bonding by the old-time owners.

ONLY ONE ISSUE.—The following is from the Marysville *Democrat*: "A bill is now before Congress providing for an appropriation of $250,000 to carry on the work of betterment of the Yuba and Feather rivers as recommended by the Government engineers. The work includes the construction of a wall of rock to span the Yuba river channel, between two high points on either side, known as De Guerre Point, at the entrance of the foothills ten miles east of this city.

This wall, as planned by the engineers, will be 100 feet in width on the bottom and will have a slope on either side which will leave the wall on the top 50 feet in width. This wall is to be constructed entirely of stone and to be sufficiently solid when finished to withstand the pressure of any force of water and detritus that will ever accumulate in the stream. The engineers in their report say the wall or barrier is not for the purpose of permitting hydraulic mining to be conducted, but is for retention in the foothills above that point a mass of sand and gravel, the accumulation of years when hydraulic mining was conducted without restraint.

And these Government Engineers in their last report say that no substantial betterment of these rivers can be expected while this flow of heavy material continues without restraint in the foothills. Their plan of betterment to follow the completion of the restraining wall they explain in part as follows:

Commencing at the wall and working down stream a channel is to be opened in as nearly a direct line to the mouth of the new cut-off as possible, then to deepen the channel of the cut-off and thus continue the work down the Feather river. Along the stream between the dam and this city where there is the greatest width they will construct brush jetties at different points, by which to force all of the water into one channel. The figures of cost and the general plans of betterment are well known by Surveyor Meek of this county, who is heartily in accord with the engineers in these projected improvements.

This is the only issue and it appeals to every man, woman and child who have interests here. Let us work for it and send to Washington approval of the efforts to obtain such appropriation.

The Supervisors, the City Council and citizens should meet and adopt resolutions in favor of the appropriation, as the matter is of great importance to the people of this city and country.

## NEVADA.

### ESMERALDA COUNTY.

THE SILVER PEAK MINES.—Walker *Bulletin*: James Hickey, for several years foreman of the Bodie and Standard mines, and now foreman of a group of mines at Silver Peak, says an English syndicate has just arranged to take those properties, put in extensive machinery and build chlorination works.

### STOREY COUNTY.

ON THE COMSTOCK.—The yield of the Overman mine for the week was 7 tons and 1075 pounds of ore, which was extracted from the north drift on the 900-foot level. The assay value of the ore per car samples was $53.92 per ton. On the 1900-foot level the Caledonia southwest drift has been extended ten feet; total length, twenty-five feet, past east crosscut No. 1. Formation porphyry, with seams of quartz.

In the Confidence mine west crosscut No. 1 from the surface tunnel is being repaired. Prospecting in the crosscuts from the end of the north drift, sixty feet about the surface tunnel, is still going on. There were extracted during the week ending February 24 twenty carloads of ore, the average top car sample assay of which shows an assay value of $21 per ton.

Seg. Belcher.—On the 300-foot level the joint Belcher and Seg. Belcher west crosscut from the south lateral drift is out 304 feet; the face shows porphyry. This crosscut has been stopped for the present. There have been hoisted during the week and stored in the ore-house at the mine twenty-five mining carloads of ore, the averrge top car sample of which shows an assay value of $28.49 per ton.

Challenge.—The joint Challenge and Imperial west crosscut No. 1 from the surface tunnel has been stopped for the present. Some necessary repairs were made during the week to the surface tunnel. The Imperial and Challenge will join with the Confidence in running one west crosscut, which will lessen the expense of these mines.

Belcher.—There have been hoisted during the week and stored in the ore house at the mine 34 mining carloads of ore, the average top car sample of which shows an assay value of $27.10 per ton.

Savage.—On the 950 level at the face of the north prospecting drift from the west crosscut, eighth floor of the north upraise, they are stoping ore above and below the sill floor of this drift. From the eighth floor of the east crosscut they have upraised and connected with the north drift from the twelfth floor. This connection affords good ventilation; the upraise is in good ore from top to bottom.

In the east crosscut at a point 35 feet south of the north upraise they have started a south prospecting drift and advanced the same 12 feet; face is in low grade quartz. During the week they have extracted and hoisted 81 cars of ore from this level; car samples average $25.81 per ton.

ROCK-PICKERS ORDERED OFF.—*Enterprise:* The management of the Gold Hill mines ordered all the ore pickers off the waste dumps of the Gold Hill mines. This will work quite a privation in Gold Hill, as many boys and men have earned enough to buy bread by scratching over the Gold Hill waste piles, making probably an average of 75 cents a day. It is thought probable that the Gold Hill mines may be thinking of working over the Gold Hill dumps by means of the Kinkead machinery.

### LANDER COUNTY.

The Austin Mining Co. says the *Reveille*, ran the big tunnel 250 feet ahead in the month of January, and the work is being pushed as rapidly this month. An air blower is to be put in the tunnel soon.

## OREGON.

### BAKER COUNTY.

The sale of the property of the Elkhorn Mining Company under execution took place last week at Baker City. The only bid was that of the First National Bank for $10,279.33 with interest and costs, the amount being the judgment held by the bank against the property.

### JACKSON COUNTY.

THE GOLDEN FLEECE.—M. A. Graham, manufacturer of the Oriental gas engine, of this city is at Ashland, with his machinery for working the gravel mine recently bonded to him by Z. A. Moody and others. The property is owned by E. K. Anderson and is known as the Anderson mine, situated three miles below Ashland. The machinery weighs twenty-five or thirty tons. The cemented gravel is broken up by blasting, then hydrauliced into 500 feet of flume, which will carry it to the mill. The machine consists of a cylinder 20 feet long and 60 inches in diameter. Inside are 113 chilled steel balls weighing seventeen pounds each, revolving at the rate of twenty revolutions per minute. It is expected that 150 to 200 tons per day will be handled.

### GRANT COUNTY.

Al Hoskins has completed an extension of one and one eighth miles on the Humboldt ditch for the Humboldt Mining Company near Canyon City.

## WASHINGTON.

WHATCOM'S GOLD MINES.—M. Muir Picken, one of the vice-presidents of the Northwest Mining Association, has prepared a report for the United States Mint at San Francisco, showing the production of gold and silver in the mines of Whatcom county for the year 1895. The report has been compiled with great care and the collection of data is from the most reliable sources. The gross production of Whatcom county mines was: Gold, $40,000; silver, $12,000. The producing mines operated in 1895 were: The Whistler, John D. Leedy, proprietor; Eureka, Baron, manager; Excelsior, O. A. Benson, manager; Snowdrop, Williamson, owner; the Mammoth, unknown ownership. All of these are in the Slate Creek district, on the western slope of the Cascade range of mountains.

Mr. Picken adds the following: "Gold was discovered in Slate Creek district in this county in 1894, and last year's work was chiefly development and placer mining. I have no doubt this year's production will show a large increase over last year. No bullion was shipped through here from outside of the county, but a large quantity of gold and silver-bearing ore passed through in transit to the Everett and Tacoma smelters. If you wish the quantities of this, I shall be pleased to give them to you. About 1,200 miners, including prospectors, were in the Slate Creek district last year. Miners were receiving from $3 50 to $4 per day."

## BRITISH COLUMBIA.

CARIBOO.—In Cariboo all the mining news is preparation for next year. The Horsefly company is getting up pipes, gates, pumps and monitors for the hydraulic elevator. A new company is the Elk Mining Company, with $10,000 capital, and H. Helgeson as manager, to work a lease on Goose creek, emptying into Cariboo lake opposite Keithley creek. A whole creek will be taken by a flume, 700 feet long, 3x6 feet, through a canyon, to dry the ground to be worked. The Quesnelle River Hydraulic Gold Mining company is preparing for work, with James Deacon as manager. A four-mile ditch will be dug and water brought from Big lake, which will be dammed. The company has 320 acres, with 160 acres further up the stream.

## IDAHO.

AT WOOD RIVER.—The Camas Gold Reef Mining and Milling Company of Hailey, has incorporated, capital stock $250,000; to operate the Alaska mine on the Camas gold reef, near Hailey. The Camas gold reef extends as far as known, from a point six miles south of Hailey to Atlanta.

A FLOATING GOLD MILL.—A Lewiston dispatch says Dean & Caples are building a new steamboat here for use on the rivers in a big mining scheme. The proposition represents the investment of $30,000. The craft will be 18x68 feet, with cabins and comfortable quarters. It will be fitted with a sixty-horse power engine for motive power and a forty-horse power engine for operation of the mining machinery. It will have steam appliances for throwing a large stream of water with such a force that it will tear down a mountain. It will be fitted with appliances for crushing quartz, assaying ore and separating flake gold from black sand.

## MONTANA.

BUTTE & BOSTON WINS.—This week the Butte & Boston Mining Company got a verdict against the Lexington Mining Company for $125,000, the value of the ore taken by the latter from beneath the surface of ground belonging to the plaintiff, by means of underground workings. The case was on trial ten days. The suit was for $400,000. Both companies own portions of the Wappello claim, having bought from the original patentee. The Lexington Company's portion is north of Butte & Boston's and its vein dips to the south. In following it, it was found that 300 feet down the vein separated as by fracture. The Lexington crosscut to the lower part of the fractured vein and continued on down, taking out ore from what it claimed was some vein that had its apex on Lexington ground. The Butte & Boston demonstrated by an appraise that the vein the Lexington had worked on below the 300-foot level was not a portion of the vein apexing on the Lexington ground, but was an almost vertical vein having its apex on the Butte & Boston property and clearly traced from the point where the ore was extracted to the surface inside the Butte & Boston part of the Wappello claim. It was also demonstrated that the Butte & Boston vein was intersected by the Lexington vein, but without breaking the continuity of the former.

One of the most important instructions of the court was in regard to the separation of the two parts of the Lexington vein at 300-foot level. The Judge said that if it becomes necessary in order to convert two separate and distinct portions of a vein to pass for any considerable distance through country rock, having none of the elements of a vein and through which intervening space there is neither mineral nor walls nor seams to be followed, then it may be concluded that the veins are permanently separated, and one cannot be followed from the other through the intervening space into the ground of another. The case will be appealed.

COPPER AND SILVER IN HELENA.—U. S. Marshal McDermott has bonded a copper mine recently discovered in the city limits of Helena. The former owners have been working it for several weeks, and smelted several tons of ore which assayed 21% copper and 14 ounces of silver to the ton. The Rothschilds mines at Anaconda and the Boston at Butte average less than 10%. The vein is six feet wide, has been exposed for some distance, and does not lose its richness. The claim is within less than half a mile of the City Hall and one corner stake is 200 feet from the back fences of some residences.

ARGENTA MINES.—Regular shipments of copper ore are being made from W. A. Clark's mines at Argenta to the Butte smelter. Three ore teams are constantly on the road between Argenta and Dillon. The ore comes out of the Goldsmith, where a force of fifteen or twenty miners is employed, and carries a very high percentage of copper, says the Dillon *Examiner*.

## UTAH.

TINTIC.—*Tribune:* Of the constantly increasing productiveness of the mines of Tintic a report which has just been compiled by the Union Pacific affords perhaps the best evidence on record. The report discloses that in 1895 there was drawn out of the district 3,762,000 tons of ore and concentrates. In 1894 the amount of freight hauled over the Tintic division reached 151,661,000 pounds, while the report for 1895 shows it to have been 422,872,000 pounds, a gain over the previous year of 265,211,000 pounds, and yet in 1893, said a gentleman who is prominently identified with the district, the company was seriously considering the advisability of reducing its service to tri-weekly trains. In the statement it is revealed that the increase in the business of the division has been due more largely to the hauling of mining supplies and mining machinery than to anything else, outside an increased output from the mines, and with all of them operating at full capacity there is no doubt but the road will find it necessary to put on additional crews and increased rolling stock.

## WYOMING.

The first gold mining machinery in Johnson county, the stamp mill of the Burlington Mining Company has reached the company's property on Jelly Creek, near Buffalo, where it will be set up and started immediately.

## COLORADO.

*Mail:* A thousand men are employed at the rate of $3 per day within a circumference of three miles of Gillett.

*Record:* The recent discoveries of gold in the foothills of the front range, near Denver, coming so shortly after the Cripple Creek discoveries, serve to emphasize the lesson often taught by experience in this State, that the real merits of a district cannot be determined by a few prospectors running over it in feverish haste, digging a few shallow holes here and there and submitting only a few of the most promising portions of the vein matter to analysis. A good prospector should be a man of intelligence, and he should have sufficient financial backing to enable him to fully exploit any find that he makes. Thorough work is no less important in prospecting than in the practical work of mining, and the mine investor who is really wise makes it a point to cultivate and liberally grubstake the experienced and capable pioneer prospector.

## NEW MEXICO.

A mining company, capital $150,000, has incorporated in Las Vegas. Incorporators: W. E. Crites, T. and B. M. Blauvelt, G. Beaty, J. Miller, W. S. Standish, I. H. Hunsaker and J. Haefner; to buy, sell, develop and operate mines in Mexico, Arizona, Colorado and New Mexico.

## AUSTRALIA.

*Mining Standard*:—Queensland departmental returns of the gold output for 1895 figures relating to the quartz mining industry show a falling off in the production of nearly 50,000 ounces. With the exception of Rockhampton, the Queensland gold fields were all less productive in 1895 than in the previous year. Croydon and Gympie, for reasons which we have already reviewed, between them account for no less than 40,854 ounces of the general decline; or particularly the difference between the yields for the two years. Rockhampton added over 7,000 ounces to her 1894 total, while the results of the cyanide process at Croydon on old tailings, were 24,000 ounces better than in 1894; otherwise the decrease in 1895 would have represented 80,000. Alluvial mining was also less successful last year than in the preceding twelve months, the decrease amounting to about 4,000 ounces. The total gold yield of the colony is officially announced at 626,200 as compared with 679,511 in 1894. We notice, however, that the comparative statement does not contain returns from some of the smaller fields, nor is any provision made for the gold from "other sources." These two items in 1894 represented 5,500 ounces, an insignificant amount compared with the grand total, but still sufficient to materially reduce the loss as at present shown by the figures for the year just closed.

## ARIZONA.

Following is the amount of copper and copper matte shipped by the Arizona and Detroit Copper Company for the year ending Dec. 31, 1895:

| | Pounds. |
|---|---|
| From Clifton, copper | 5,142,555 |
| " matte | 2,655,318 |
| From Morenci, copper | 4,315,850 |
| " matte | 1,567,850 |
| Total, copper | 13,738,695 |
| Total, matte | 4,661,168 |

They also shipped to El Paso 1,590 pounds of silver ore, which netted $539. During the month of January, this year, the amount of copper shipped was far in advance of any single month since the present company have owned the mines and plant.

## SOUTH AFRICA.

"ECONOMIES OF GOLD MINING."—At a meeting on the 8th inst. in London, England, of the North of England Institute of Mining and Mechanical Engineers, Prof. Louis read a paper on "The Economies of Gold Mining." Prof. Louis in his paper dealt with gold mining in its most recent developments, the subject of gold mining being of universal interest, owing to its object, "gold," being the universal standard of value. Before the discovery of America the amount of gold in the world was very small. It has been estimated at less than 30,000,000 ounces. After the end of the fifteenth century better statistics are available, and it is estimated that from the fifteenth to the sixteenth century the output of gold in the world was nearly 250,000 ounces per annum, while at the present time the gold output would be from 9,500,000 to 10,000,000 ounces, or a total output since the year 1500 of about 425,000,000 ounces of gold. After entering minutely into the fluctuations in the output of gold from 1500 up to the present time, Prof. Louis then dealt with the modes of working employed in obtaining the precious metal, both from the matrix and from the alluvial deposits. He pointed out that the origin of gold as it exists was a subject still involved in much obscurity. His opinion was that the gold was dissolved in the form of an alkaline aurate, although there was much to be said for the view that it might have been a soluble silicate; in either case the solutions were certainly alkaline, and carried with them a very large amount of dissolved siliceous matter. Accordingly all deposits of gold were characterized by the existence of quartz in very large proportions, quartz being, in fact, an invariable concomitant of gold. In all countries in which gold was found the conditions of its occurrence seemed to be practically identical as far as the mode of origin of gold is concerned. It was interesting to learn that seven-eighths of the gold production of the world was produced in but four districts—America, Russia, Australia and the Witwatersrand. Each one of these districts had its own peculiarities. Prof. Louis then dealt with their distinguishing characteristics, and stated that at the present day the South African practice was the best, the reason being that South Africa was the youngest gold field, and was thus able to benefit greatly by American experience, which had hitherto been the best. Prof. Louis dealt more particularly with the Witwatersrand deposits, as the conditions in which gold occurred there—viz., in true beds—rendered their underground workings comparable to that of many coal mining districts.

Many diagrams and views were shown by means of an optical lantern to the gentlemen present at the meeting, and were fully described by Professor Louis. The modes of mining, the sinking of shafts and levels, the bringing of the ore to bank, etc., were matters also fully entered into and explained. The costs of mining were given in detail, and the different machinery for the crushing, etc., of the ore was described. The proportion of gold collected by the various processes in one of the best managed mines of the Witwatersrand was given as follows:

| *Obtained by*— | *Per Cent.* |
|---|---|
| Amalgamation | 69 |
| Concentration and chlorination | 9 |
| Cyanide process | 16 |
| | 94 |
| Left in the tailings | 6 |
| Total available gold | 100 |

The cost of the above methods of treatment may be set down as follows, bearing in mind that in South Africa all calculations are made upon the very convenient short ton of 2000 pounds:

| *Cost of*— | *Per Ton.* |
|---|---|
| Milling | 4s 6d |
| Concentrating and chlorinating | 3s 3d |
| Cyanide process | 7s 9d |
| Total | 15s 6d |

The above were fair average figures, but the items were subject to a good deal of variation in individual cases. Taking the value of the ore at £3, some 16s must be subtracted for gold extraction, and this, with taxes, would run up to 25s, so that the value of the ore at the pithead would be about 35s per ton. After deducting other charges and expenses, the profit might be put at 15s, or 25 per cent, and the methods of mining employed varied with the circumstances of the various mines. The magnitude of the mining operations might be best appreciated from the fact that in 1894 there were nearly 2,830,000 tons mined in a strip of land only twenty-five miles long and about a mile wide.

## Coast Industrial Notes.

—Prest. J. J. Hill of the Great Northern Railroad will shortly begin the construction of a $100,000 depot at Seattle, Wash.

—San Francisco merchants now send goods to Arizona by way of steamer to Guaymas, thence to their destination via Santa Fe Railroad.

—A tug boat for towing along the Central American coast is being built for La Libertad owners by the Fulton Engineering and Shipbuilding Co.

—The Pacific Rolling Mills are temporarily closed, during which cessation of work considerable will be done in the way of additions and improvements.

—The Everett, Wash., pulp and paper mill has advertised for 20,000 cords of fir, 5000 cords of cottonwood and 1500 cords of spruce for the coming year.

—The Alameda, Cal. City Trustees have given the contract for dynamos for the municipal electric plant to John Martin of this city. The price is $7,463.

—The new Santa Rosa, Cal., water works, built at a cost of $165,000, were put in successful operation this week. They were built by Paul B. Perkins of this city.

—At a special election held at Suisun, Solano county, last week, to vote $42,000 bonds for a public waterworks, only six votes were cast against the proposition.

—Seattle, Wash., has discovered that Buffalo and other New York cities are shipping their paupers westward, something that San Francisco long since found out.

—The Southern Pacific has reduced the rates of $15 first class and $7.50 second class between this city and Portland, Or., to $10 and $5, respectively. The reduction takes effect to-day.

—At last the Union Iron Works has received the delayed armor plate from the Government for the battleship Oregon. The vessel can now be ready for final inspection and test by May 15th, 1896.

—Nearly 200 men are now at work on the new electric road which will extend from Marin valley to the summit of Mount Tamalpais. The Risdon Iron Works will furnish the engines and boilers, and the General Electric Co. the electrical appliances.

—Congressman Johnson this week introduced a bill in the House of Representatives directing the Committee on Ways and Means to investigate Japanese manufactures and the effect their future development will have upon commerce and manufacturing industries.

—It is wired from Washington as an important news item that Speaker Reed, of the House of Representatives, is in receipt of a twenty-three pound salmon from the Columbia river. It would be possible without special effort, later in the season, to send a sixty-pound salmo quinnat from that river.

—The S. F. *Chronicle* last December announced that it would send a silver cup to every baby born on this coast December 25th, 1895, and did so. The *Ledger*, published at Mexico, Missouri, now announces that it will give a similar silver cup to every baby born in the county in which that paper is published during the week ending December 31st, 1896.

—Marsden Manson, of the Bureau of Highways, has returned from an inspection of the roads in Inyo and Mono counties. He states that from the Sonora Pass, near the southern end of Alpine county, to Walkers' Pass, in Kern county, a distance of 200 miles, there are no open wagon roads crossing the Sierras. The Bureau will at once proceed to remedy this state of affairs.

—The Oakland and Livermore Valley Railroad Company has incorporated in Oakland, Cal., to construct a railroad between that city and the Corral Hollow coal mines. It is capitalized at $3,000,000; $45,000 has been subscribed. The line of the proposed railway is to begin near the eastern limits of Oakland, thence to a point near Livermore. The total length of the proposed road is 45 miles.

—There are the usual unauthenticated reports regarding the extension of the Burlington road from its present terminus at Billings, Montana. Rumor No. 1 extends the line to Great Falls; rumor No. 2 extends it to Spokane and the coast; rumor No. 3 extends it to the coal fields on the other side of the line and Canadian Pacific connections, and rumor No. 4 gives it a terminus in Alaska.

—The San Joaquin Valley Railroad directors have given Cotton Bros. a contract to build a bridge across the Merced river for $45,000. It will be 2600 feet long and forty feet above the water. Most of it will be trestle work. There will be three spans over the river proper, each 125 feet long. The spans will be composed of wooden trusses bound with iron, and will rest upon piers of piling.

—Easton, Eldridge & Co., of San Francisco, have an option on 40,000 acres of the Chino ranch, which if they negotiate, is to go for $1,600,000. The contract expires March 26th, 1896. The property included is the entire Chino ranch except 320 acres of townsite, and 1000 acres to be selected. It also covers the Chino Valley Railroad, all water rights and everything appertaining to the property. The terms of sale, if made, is one-fourth of the purchase price in cash, the balance in three equal annual installments, at 7 per cent interest.

—Tacoma, Washington, reports that $3,000,000 has been subscribed in New York to buy the Tacoma Eastern Railway and extend it to the Pacific Forest Railway Reserve and the Cispus Pass. The Tacoma Eastern consists now of seven miles of standard guage track, extending from tidewater seven miles southeastward. The Puget Sound, Mount Tacoma and Eastern Railroad Company proposes to carry out the project. Officers: President and General Manager, G. L. Holmes of Tacoma; Vice-President and Treasurer, Thomas Morch of New York; Secretary and Assistant Treasurer, P. V. Cæsar of Tacoma.

—The annual report of the Southern Pacific Co., for the year ending June 30, '95, shows that the capital stock is 1,500,000 shares, par value $100 each. The total amount issued and outstanding is $120,934,170, of which $1,000,000 is represented by shares issued for cash, the balance having been given for stock of railway companies. The income account for the Atlantic and Pacific systems of the Southern Pacific shows gross earning from operation, $35,847,810.36; operating expenses, $23,797,596.24. The total gross earnings from operation are stated at $31,245,143.89, made up as follows: Total freight earnings, $19,187,454.08; total passenger earnings, $11,021,129.62; total other earnings, $1,036,560.19.

—Santa Fe officials have recently been turning their attention to the efficiency and earning power of their locomotives. A report was recently called for by the Board showing what one additional loaded car on each freight train on the system would mean in earnings during the year. The answer was that if each freight train carried one more loaded freight car there would be additional earnings amounting to $1200 per locomotive for the year. The importance of this is in the fact that the Santa Fe has something like 1000 locomotives, and with the additional loaded freight car on each train there would be $1,200,000 in all earned. Moreover, this would be net, because it would cost no more to haul that extra car than it costs to haul the present load.

—K. B. Anderson, who recently bought in the Nevada Southern Railroad, has filed in the San Bernardino county recorder's office a deed transferring the road to the California Eastern Railway Co. At the same time a copy of the articles of incorporation of the California Eastern Railway Co. was filed in the county clerk's office, having been mailed there by Judge Dillon of Los Angeles. The company was organized by Denver capitalists, is capitalized for $1,500,000, and includes among its directors H. C. Dillon and I. B. Newton of Los Angeles. The main office of the company is in Denver and branch offices are located in New York, Los Angeles and Manvel. The road will be extended beyond Manvel about forty miles, making the entire road seventy-five miles in length. It will run from Blake on the Atlantic and Pacific to Goode Springs, Lincoln county, Nev.

—An agricultural paper interested in California colonization is advertising a $55 rate from Chicago to California. This is $7.50 less than the authorized rate. The name of the road over which the rate is applicable is not stated. Nevertheless, the advertisement caused something of a sensation and aroused no end of suspicion that some of the roads are not living up to their obligations. Western roads will not allow their Eastern connections to sell tickets to Colorado points via the Missouri river gateways at short time rates after March 1. Their reasons are that these circuitous road tickets are used to scalp rates locally from the Missouri river to Colorado common points. After the date named rates from Texas to Colorado common points must be made up of the sum of locals from Texas points to the Missouri river gateways, and from the river gateways to destination.

—The sixteenth annual report of the U. S. Geological Survey shows that the increase in the production of petroleum in California in 1895 over the previous year was 50 per cent. The report on 1895 will show an increase also, probably to an aggregate of 1,000,000 barrels. The Appalachian fields show exhaustion. California oils will yet be refined. There are no limits to the powers of science, and nothing hid from the genius of invention. Coal oil was first extracted and refined from shale and cannel coal. Some manufacturing chemist will yet bring kerosene from Los Angeles petroleum. The consumption of fuel oil in California is increasing slowly. The output of oil can be more easily increased than the consumption can. Every producer in the Los Angeles oil field whose wells are "shut down" knows how he can open them up and increase his flow of oil, but he does not know where he can find customers. There is no inducement for capital to go into the district either to produce or to buy oil. Neither consumption nor tankage is commensurate with the production. The magnitude of the trade here is disappointing to Los Angeles. It does not amount to 500 barrels per day, about one-half of which only goes from the Los Angeles field. The coal men are united, vigilant and wealthy, and do not propose to yield up their business without a battle. They have possession and hold all the vantage grounds. There are other troubles and difficulties here for the Los Angeles oil men in the two veteran, powerful oil companies that have long furnished the fuel oil trade of San Francisco and have in tanks three-fourths of all the petroleum on the Pacific coast. An oil producer writes to the Los Angeles *Times*: "If there was ever a time that the oil producers should all stand in together, it is now. Wells in general have fallen off in their production one-half in the last sixty days. Consumers and those who have got large contracts in the future are now alarmed and trying to secure contracts from the well-owners at the present low prices. Do not promise one barrel ahead for at least less than 50 cents at the well. Oil should be 75 cents within thirty days, and could be if a few that now have full tanks were only willing to hold on. Had you not rather have 75 cents for the balance of the year after thirty days than sell now at 40, and so on afterward? You have your choice of the two propositions. Money is now here to secure future oil. There are a few of our own people also helping to keep oil down at a death price. They have secured contracts beyond the capacity of their own wells, and are now running around over the field to those who are not posted, and, with the promise to relieve their tanks right away, secure a contract ahead at a low price. Now, they are really cutting their own throats. Many have lost their all in this business, and many more will if prices do not go up. Nine-tenths of the people in the field to-day would not put down another well if prices of 50 cents only were guaranteed. So you can plainly see that, with the production running rapidly down, and no new wells drilling (comparatively), oil must go up to at least $1 per barrel, which is very cheap for it." A number of the leading producers say their wells are only paying running expenses, to say nothing about getting their money back originally put in the business. Twenty carloads of oil were shipped from Los Angeles to San Pedro last Wednesday—part of the cargo of the tank steamer Enoch Talbot, now loading at that port for this city. The shipment is consigned to the Arctic Oil Works and will consist, complete, of 7,000 barrels.

## Recent Mining Dividends.

The Gold Coin Mining Company of Cripple Creek, Colo., has declared a dividend of 1½c per share, payable March 16.

The Montana Ore Purchasing Company paid a dividend of $1 per share, or $40,000, on the 20th.

The Ontario Silver Mining Company has declared a dividend of 10c per share, payable February 29.

The Etna quicksilver mine in Napa county will pay a dividend of 10c per share on March 2.

The Highland mine of South Dakota paid a dividend of 25c per share on the 20th.

The Quincy copper mine of Michigan paid a dividend of $4 per share on the 17th.

The Calumet & Hecla copper mine of Michigan will pay a dividend of $5 per share on March 3.

The Homestake Mining Company of South Dakota paid a monthly dividend of 25 cents per share on the 25th.

The Arizona Copper Mining Company, headquarters Edinburgh, Scotland, has paid a dividend of 1s. 6d. per share, making a total of £3 per share for the year.

## Recent Mining Incorporations.

The Ruby Queen Milling and Mining Company, San Jose, Cal.; capital stock, $100,000; directors, T. E. Johnson, K. E. Johnson, H. Postlethwaite, R. R. McLeod of San Jose and H. W. Postlethwaite of Saratoga, Cal.

The Boulder Mining Company, this city; capital stock, $1,000,000, of which $5000 has been subscribed; directors, F. W. Williams, H. A. Brown, J. H. Mangels, J. M. Wilmans, James O'Connell.

## Personal.

R. C. Campbell-Johnston of Vancouver has been elected president of the Society of Mining Engineers of British Co-lumbia.

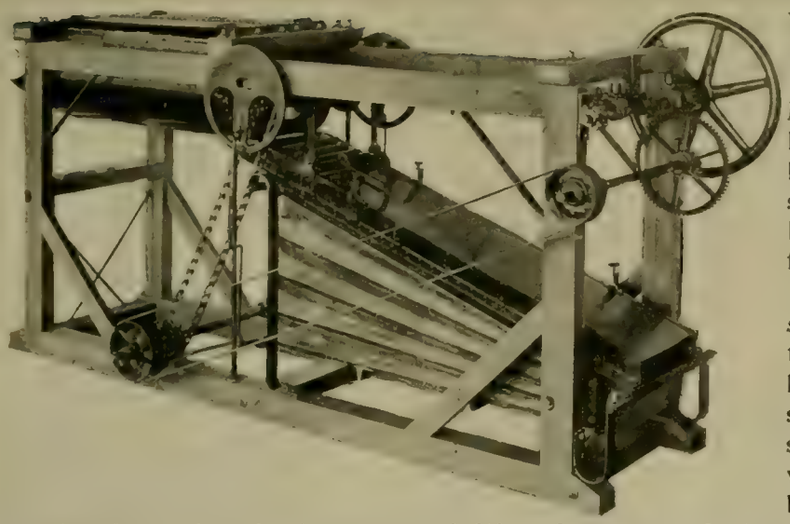
R. I. Thomas left Grass Valley last Friday for Washington, D. C., in the personal interests of pending mining legislation.

J. E. Buckley of Spokane, Wash., goes to Iquiqui, Chile, on a salary of $36,000 per annum, as auditor of a railroad at that place.

Thos. J. Barbour of the Risdon Iron Works has returned from Butte, Mont., where he secured a contract for a hoisting engine of a capacity of fifteen tons load from a depth of 3500 feet at a speed of 2500 feet per minute.

Colonel G. H. Mendell, having retired from active service in the Corps of Engineers, U. S. Army, is now at liberty to offer his services to parties desiring professional reports or advice on engineering projects or constructions. His long service in charge of public works distributed between the Mexican and Dominion boundaries has given him acquaintance with local conditions appertaining to the intervening territory on and near the Pacific coast, which acquaintance he hopes to make useful to those who may consult him. The high character of such service is known and appreciated. His office is at 530 California St., this city.

## Commercial Paragraphs.



The Pelton Water Wheel Co. of San Francisco has recently shipped a 400 H. P. wheel to run the new 120-stamp mill of the Alaska-Mexican Co. on Douglas island, Alaska. The Alaska-Treadwell mine, adjoining, is using eleven Pelton wheels in its various operations of milling, pumping, hoisting, air compressors, dynamos, etc. The company states "A single wheel seven feet in diameter is running the entire mill, consisting of 240 stamps and ninety-six concentrators, requiring upwards of 600 H. P. A notable instance of the advantages of water power in mining operations is afforded in this plant—not only as regards initial cost, but in operating expenses. The wheel above referred to weighs less than 1000 pounds and the entire equipment, embracing shafts, boxes, driving pulleys, etc., only about 4000 pounds. A steam power plant to give the same capacity would not weigh less than 200 tons, and the expense of operating such a plant would be well into the thousands every month, while the cost of running the Pelton wheel is merely the oil used for the journal bearings. The operation of this extensive plant affords also an excellent illustration of the advantages of the modern economical methods of mining, and of how low-grade ore can be made to pay large dividends."

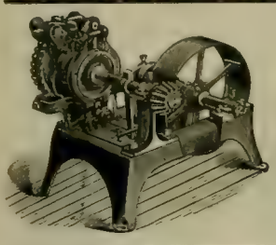
This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.

WE make mining machinery of all kinds. We also "make the Miner," that is, Woods' Dry Placer Miner, as illustrated here. Users say it is "really perfect." In writing about it ask for catalogue 51.



Smelters are using our semi-steel moulds, kettles and pots extensively; they give first rate satisfaction. We are also making welded steel water jacket furnaces, better than anything previously produced. Among specialties of our manufacture are perforated metals; also riveted steel pipe for hydraulic lines. You will find us obliging in making estimates and giving particulars, as we aim to serve the interests of our customers in the best way.

# Practical Information.

### Nuts on Wagon Axles.

Every now and then one hears of a wagon wheel coming off through the loss of a nut, and an accident of this sort is apt to be attended with further injury to the vehicle or its load. If the latter is heavy, the end of the axle is liable to strike the ground abruptly enough to break off a portion, or at least to spoil the screw thread. This thread, by the way, is right-handed at one end of the axle and left-handed at the other, so that the nut, in going on, turns in the same direction that the wheel does when the wagon is moving forward. If the wheel exerts any influence on the nut through friction, therefore, its tendency usually would be to tighten the nut. It would only be in backing, apparently, that the nut could be loosened from that cause. It is surprising, perhaps, that such a thing should happen at all, but it does, and a good many people, farmers and blacksmiths, have wondered how it could best be prevented.

A generation or two ago, some carriage makers put a pin through the nut and the axle-top. This, of course, would serve well enough for a while, but after the nut had been removed several times, in order to allow the axle to be greased, the thread would be worn a trifle. Hence, if the nut was tightened up properly with a wrench, the hole would not be in the right place for the pin. A scheme which has been tried with great success for many years is to have two nuts, one going on after the other, and each screwing in a different direction. A pin ties the two together, and the double nut is thus perfectly locked. The patent on this idea ran out long ago, and there are several makers of this style of axle. But one must pay an extra price for it. This is the most efficient plan in use, probably; but it has been suggested that nuts, not only on axles, but also on the bolts through the ends of the springs, might be kept in place by using spring washers, such as are now employed in certain parts of a trolley-car gear, and as nut locks for railway track bolts. Again, a wonderful grip is secured in one of the track bolts lately introduced by cutting the thread in a peculiar way. The same scheme ought to work in a wagon axle.

However, there are plenty of country wagons and city trucks, some of which are used in hauling enormous loads over rough highways, which are provided with no special means of securing the nuts, and which never lose one. The secret of this, probably, is that the nuts are well fitted, and are closely watched. If the nut pinches tightly enough, and if the screw thread is kept free from grease when the wheel is off, no accident of this sort ought to happen. But when the nut is worn by long service, and goes on too easily, there is always a certain amount of risk, especially if a man is careless in greasing the wheels. And such a man, too, will probably neglect to examine the nuts occasionally and try to tighten them with a wrench.

PAPER PULP is one of the most useful articles within reach of mankind. Mixed with glue and plaster of paris or Portland cement, it is the best thing to stop cracks and breaks in wood. Pulp paper and plaster alone should be kept within the reach of every housekeeper. The pulp must be kept in a close-stoppered bottle, in order that the moisture may not evaporate. When required for use, make it of the consistency of thin gruel with hot water, add plaster of paris to make it slightly pasty, and use it at once. For leakage around pipes, to stop the overflow of water in stationary washstands where the bowl and the upper slab join, it is invaluable. Used with care it will stop small leaks in iron pipes, providing the water can be shut off long enough to allow it to set. Around the empty pipe wrap a single thickness or two of cheese-cloth just wide enough to cover the break, then apply the compound, pressing it in place and making an oval of it, somewhat after the fashion of lead-pipe joining, only longer. The strength of this paste, when once it is thoroughly hardened, is almost beyond belief. The piece of cheese-cloth prevents any clogging of the pipe by working through the cracks. Paper pulp and fine sawdust, boiled together for hours and mixed with glue and linseed oil, make a perfect filling of cracks in floors. It may be put on and left until partly dry, then covered with paraffine and smoothed with a hot iron. The surface, if properly managed, is equal to the polished wax floor.

### Handling Material in Shops.

A recent issue of the *Iron Age* gives an account of a reform which was effected in a large manufacturing establishment by the use of a simple diagram made by a young engineer in its employ. The account follows:

Convinced that the large economies had been well looked after, and that his greatest usefulness lay in the discovery of opportunities for small savings, the young man made a diagram showing a ground plan of the works. On this diagram he traced, in colored lines, the course of the various materials employed in the industry. The results were surprising. The path of each material entering into the finished production of the works suggested nothing so much as an admiralty chart tracing the course of a derelict at sea. Instead of moving steadily forward from stock pile to shipping room it was found that the material zigzagged around the works, twisting, turning and doubling on itself until its path was twelve or fifteen times the greatest length of the plant. Obviously this meant unnecessary handling. Looking more closely, the investigator discovered that instead of being a continuous process the business consisted of half a dozen or more separate processes, each in the hands of a little group of workmen whose special skill had for years been overvalued, but who had taken good care to see that no one of their number set a pace which the others found inconvenient. Over each of these groups was a foreman whose ambition it was to erect his branch of the industry into a distinct department. To this end he had got it as much as possible by itself, and was not satisfied until he had a closed door between his room and the one adjoining it. No one realized the evils of this system until the diagram of which we have spoken made it evident at a glance. To effect the reform needed, recourse was again had to the graphical method, and it was found that with very little expense the amount of moving and handling of material in process of manufacture could be reduced one-half. One or two new doors were cut, and the machinery was rearranged with a view to bringing the several processes as nearly as possible into line. As a result it was found that a good deal of the unskilled labor formerly employed about the works could be dispensed with. It was further found that the problems of the management were materially simplified, and that the unequal working of the several departments was early and permanently corrected. What has been half a dozen processes became one continuous process. By a discreet shifting of labor the special skill of each little group of mechanics became common property, and the cliques which had been a break on the wheels of the industry were effectively broken up. The weekly payrolls were materially reduced, the output was increased in quantity and improved in quality, and a very pronounced tendency to "dry rot" was checked and corrected.

CRYOSTASE is the name of the new substance discovered by a German chemist, which has the remarkable property of solidifying under the influence of heat and again becoming liquid at temperatures below freezing point. It is obtained by mixing equal parts of phenol, camphor and saponine, to which is added a rather smaller quantity of turpentine. This is the only substance at present known which possesses the property of liquefying when cold and becoming solidified when hot, for, if some substances, like albumen, harden at a slightly high temperature, they cannot be brought back again to the liquid state, even under the influence of a very low temperature.

BATH METAL is made from tin and copper. Bell metal results from zinc and copper. Bronze is the product of copper and tin. Britannia ware is made from copper, bismuth and antimony. Cannon metal is formed of copper and tin. Dutch gold is made from copper and zinc. German silver is composed of zinc, nickel, copper and a small portion of iron. Standard gold is made from gold and copper. Copper and tin form gun metal. Mosaic gold is a combination of copper and zinc. Pewter is made from lead and zinc. Sheet metal is composed of lead and a small quantity of arsenic. Standard silver is made from silver and copper. Solder from tin and lead. Type metal the combination of antimony and lead. White copper is made of copper and arsenic.

IT is remarkable what slight variation there is in the temperature of the healthy human body. The normal temperature is 96.6. The great peculiarity about the temperature in men is its evenness under all conditions. Heat or cold causes but slight variation, and in man less than in any other animal. In extremes that would be fatal to many animals man can endure and enjoy good health. We read of Arctic voyagers enduring a temperature ranging from 80° to 90° and even 102° below zero, while, on the other hand, in the tropics, during the greater part of the year, the temperature ranges from 106° to 110° above, and yet men enjoy good health in such varying temperature, and the heat of their blood varies very little.

SAN FRANCISCO, CAL.

READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF LA CANDELARIA CONSOLIDATED MEXICAN MINING CO. / SAN DIMAS, DURANGO, MEXICO, October 25, 1888. \

RISDON IRON WORKS, San Francisco: Gentlemen: Our company has been operating a three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard. We crush through a No. 90 mesh screen. Our mills run 24 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours, through 70-mesh, 14 tons, and through 80-mesh, 16 tons. This proportion has been continuous. One set of dies will crush from 1500 to 1600 tons.

One set of tires will crush 1500 tons.

One ring plate will crush from 2200 to 2500 tons.

The mills require very little attention. At our mill an ordinary peon, costing one dollar per day, has complete charge.

In regard to slimes, in comparison with stamps, by reason of the absence of surface and the continuous agitation by the scrapers, a much less amount of slime is created. A three years' experience teaches us that in every respect the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours, and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule backs over as difficult a road as any in Mexico. As a gold amalgamator it is surpassed by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY. / EUREKA, UTAH, August 24, 1895. \

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco: Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz. capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec'y. \

BULLION-BECK AND CHAMPION MINING COMPANY. / EUREKA, UTAH, Aug. 24, 1895. \

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco: Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY. / S. BAMBERGER, President and Manager. / SALT LAKE CITY, UTAH, October 10, 1895. \

R. R. TAWNDRAW, Esq., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO. / C. C. McIVER, President; D. CUSHMAN, Secretary. / MISSION SAN JOSE, CAL., Oct. 17th, 1895. \

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

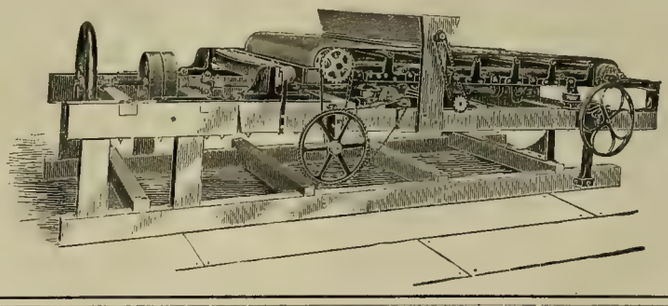
PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94⅝ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

## The Markets.

SAN FRANCISCO, Feb. 27, 1896.

The advance noted last week continues. Prices have bettered and, though sales are still slow, it is evident that the hold-off policy cannot much longer continue. An official of the Illinois Steel Company states an interesting fact bearing on the business situation. A year ago this company had orders on its books for between 15,000 and 20,000 tons of steel rails. To-day it has orders booked for about 100,000 tons. The inference to be drawn from this fact is that without regard to present earnings or future prospects the railroads find themselves in a position where they must increase their expenditures for renewals, a natural result of the policy of retrenchment which they have been pursuing since the panic of 1893.

In metals, silver has made the most noticeable advance, being quoted to-day at 68¼, the highest since the slump of July, '93. Big dealers differ as to the reason for the advance. It is to be hoped the better quotations will show a permanent increase. Seventy-five-cent silver would mean much to the silver mining industry of this coast.

## Mining Share Market.

SAN FRANCISCO, Feb. 27, 1896.

The market has been more or less lifeless the past week, with changes in prices few and far between, and these have been only a few cents up and down. Never in the history of the Comstock mines has the market been kept for so long a time at materially the same prices ruling for shares. Of necessity there have been spasmodic movements, but after each falling back the market was left in a still worse condition. The few chronic traders and the few believers in "big things" to come have their faith most fearfully shaken. It now looks as if there has been played a desperate game of freeze-out. If such has been the case it would seem as if those who have managed it have been quite successful. At this writing every indication points to better prices in the near future, but whether for the purpose of collecting a line of assessments which is to be levied in March, or to promote a fairly respectable sized deal, remains to be seen. In either event it is quite safe to affirm that outsiders will, as usual, be the victims. What the improved prices will be on is, as yet, more or less a disputed point. Some contend that it will be on an improvement reported in two or more mines, while others think it will turn on a contest for election, while others again think it will be done on the presence in this city of Eastern operators. To the average operator and broker it makes but little difference what are the underlying causes for better prices and a more active market so long as they are brought about. It is no longer a secret that ex-Senator Jerry Lynch is in the market to wrest the control of Hale & Norcross from J. L. Flood. If Mr. Lynch is truly desirous of securing control of this mine it is only reasonable to look for better prices for the shares, but it is also equally as reasonable to assert that prices for the shares in other mines will be only sympathetically affected, in which event, that after the election conditions will be still worse. It is stated that the Hale & Norcross mine can be placed on a paying basis, if managed on business principles. Those who believe in better prices on mine improvements assert that in several mines considerable ore can be developed whenever wished by the powers that be. This kind of statement has been made for years past, but it failed, quite as often, of materializing. Parties contending that better prices will rule owing to the presence of Eastern speculators, state that there is now in this city a person connected with two large moneyed operators at New York City, while James R. Keene will be here soon. The New York *Wall Street Journal* of February 20th states that the latter was at El Paso, Texas, on his way to California. It may be that the small pools see in Mr. Keene's arrival an opportunity to promote a bull movement, even if that gentleman cannot be induced to do something.

The Hale & Norcross suit is still in court, while papers are being drawn up looking to taking an appeal to the Supreme Court of the Con. Virginia suit. It looks bad for anything big while these suits are still in court.

News from the Comstock mines is essentially unchanged, although some important work is nearing completion for the more active exploiting of the mines affected. In Alta the work under way is in and around the Keystone ledge. Experienced miners state that when proper work is done on this ledge, good results will follow; but whether it is the purpose to have the work done now, the writer is not in position to state. In Overman they are slowly but surely doing some developing work, and at the same time extracting a few tons of ore each week. The work in Belcher and Seg. Belcher is being slowly pushed ahead. An assessment will be necessary to continue the work. In Crown Point there is more or less active work toward the east and west. After sale day it ought to begin to look better. It is stated that no work is being done in Yellow Jacket. What the work was discontinued for it is hard to say, except to create the impression that there is nothing in the mine. In Challenge and Confidence work on the upper levels is still being done, but it is managed in such a way as not to strike much ore, if the latter is there, as some say. In Con. Imperial and Alpha the west drifts are being run at a snail's pace. Perhaps they may strike the west lode in the course of a year even at the present slow progress. In the middle mines the work seems to be more energetically prosecuted than is that in the Gold Hill group. Some ore is being raised by each mine, but it is not of sufficient quantity or high enough grade to excite attention. There can be no doubt that in two of these mines the work deserves close watching, for it is in the right direction, according to the opinion of experienced miners. While saying this, operators must not forget that the work can be stopped or else turned and plausible excuses be given for doing so. The work in Best & Belcher and Gould & Curry does not attract attention. These two mines are hardly mentioned now. The majority of miners and also operators are watching with great interest the work under way in Con. Virginia. Connection is nearing completion between this mine and Ophir on the 1000-foot level. When this is accomplished, then the former mine will be in better position to prosecute work on that level towards the Ophir. It is freely asserted that ore will be found, but how much and of what grade it is hard to say. Another assessment will be levied and probably collected before this result can be found out. In Ophir and Mexican the work is essentially unchanged. Some ore, but very low grade, has been found in Ophir. In this mine they have also run into some old fillings that will pay now if there is enough to justify raising. The work in Union and Sierra Nevada is about as heretofore reported. These two mines ought to be in good condition for more active work before the summer months pass.

Attention is largely centered on the work being done in Occidental on the Brunswick lode. It seems as if Mr. Zadig, who is credited with the control of this mine, is doing all in his power to find ore and at the same time keep the shares fluctuating. A shaft was started lately which it is hoped will run into good ore before it goes down even two hundred feet, and in the meantime exploiting work is being actively pushed. The work in this lode that is being done by other companies is said to be deserving attention, but the writer must admit of very little personal knowledge regarding the lode, and therefore can not write knowingly on the subject. There are well-informed miners who are quite enthusiastic over the Brunswick lode, and look with confidence to quite a body of ore being found before the end of the current year.

From the Bodie district there is nothing new to report. The same old stereotyped official letters are sent down here. They give distances, etcetera, with an unvarying sameness which must be truly charming to some, but is tiresomely monotonous to outside shareholders.

The following illustrates the changes of the week:

| MINES. | Feb. 20. | Feb. 27. |
|---|---|---|
| Alpha | $ 12 | ..... |
| Alta Consolidated | 14 | ..... |
| Andes | 16 | ..... |
| Belcher | ..... | ..... |

# Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY. Location of principal place of business, San Francisco, Cal.; location of works, Auburn, Placer county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of February, 1896, an assessment (No. 2) of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of April, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made be before, will be sold on THURSDAY, the 30th day of April, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office—237 Twelfth street, San Francisco, California. Office hours from 8 to 10 P. M.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 30th day of January, 1896, an assessment (No. 42), of 15 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 22 Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of March, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 28th day of March, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JNO. W. TWIGGS, Secretary.

Office No. 22 Nevada Block, San Francisco, California.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 10th day of February, 1896, an assessment (No. 3) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 38 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of March, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 10th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, 38 Crocker Building, San Francisco, California.

American and Foreign patents obtained and general patent business for Pacific Coast inventors transacted with perfect security at reasonable rates, and in the shortest possible time

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S and Foreign Patent Agency, the following are worthy of special mention:

WATER HEATER. Joseph N. Sturm and Henry Froelich, San Jose, Cal. No. 554,745. Dated Feb. 18, 1896. This invention relates to a device which is especially designed for heating water for family uses. It consists in the combination of a boiler, a tank or receiver and circulating pipes and closed chamber situated below the boiler and separated from the bottom of the boiler proper, a burner formed in the top of said chamber, a generator passing through the space between the plate and the bottom of the boiler, a connection from one end of the generator having a nozzle, a pipe entering the mechanism chamber and receiving the discharge of the nozzle, a feed pipe connecting with the opposite end of the generator, a pipe in communication with the feed pipe extending below the generator, an intermediate filling of flame-arresting fine wire gauze between the burner and the bottom of the boiler and means for supplying hydro-carbon fluid to the generator, together with a trap which prevents the vapor being forced back into the feed pipe

DETONATING BURGLAR ALARM. Wm. C. Longstreth, Oakland, Cal. No. 554,887. Dated Feb 18, 1896. This invention consists of a stock or body having a shoulder with a projecting holding arm at about right angles and having a striking lug, a spring hammer connected with one end of the stock or body and having its other end freely playing over the arm having the striking lug, and means on the hammer for holding a percussion cap in position to be exploded by the striking lug. The device is a simple, efficient and portable burglar alarm, adapted to be readily applied to either door or window, as may be required.

FENCE WIRE COILER. Wm. C. Wadsworth and Edson Schuyler Wadsworth, Sutter, Cal. No. 554,749. Dated Feb. 18, 1896. This invention is a device for winding up or coiling barbed or other fence wires, upon the occasion of removing the fence, or when it is otherwise necessary to dispose of or to store the wires of the fence. It consists of a wheeled frame carrying a shaft which is driven by power derived from the running mechanism of the frame, a reel mounted loosely upon said shaft and a slip connection between the reel and the shaft whereby the constant speed of the shaft is converted into a variable revolution of the reel, according to the gradually increasing diameter thereof, as the wire is wound upon it, whereby the wire is kept taut throughout the whole course, while the travel of the wheeled frame remains constant.

TYPE-WRITING MACHINE ATTACHMENT. Peter F. Nilson, Phœnix, Ariz., assignor of one-half to Benjamin A. Fickas of same place. No. 554,831. Dated Feb. 18, 1896. The object of this attachment is to enable the machine to write upon the pages of bound books, pamphlets, pads and other folded sheets, as well as upon ordinary sheets of paper. It consists in a novel holder for the book, pamphlet, pad or paper whereby it is presented in proper position to the action of the type, and in the necessary adjustments and means for effecting them, whereby the position of the holder is varied, as required.

**MINING AND SCIENTIFIC PRESS,**

**220 Market Street ..... San Francisco, Cal.**

### *Assaying.—Part I—Gold and Silver Ores.*

Second edition. By C. H. Aaron. Embraces 130 12-mo pages with illustrations, well bound in cloth, 1889. Price, postpaid ..... $1 00

### *Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price postpaid ..... $1 50

### *Assayer's Guide.*

By Oscar M. Lieber ..... $1 50

### *Assayer's Manual.*

By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated ..... $4 00

### *Manual of Assaying—Gold, Silver, Copper and Lead Ores.*

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 353 pp. Price, postpaid ..... $2 50

### *Notes on Assaying and Assay Schemes.*

By P. De Peyster Ricketts, E. M. Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth ..... $3 00

### *Blowpipe Analysis—Manual and Qualitative.*

By F. M. Endlich ..... $4 00

### *A Practical Guide for Prospectors and Miners*

By C. W. Moore. With numerous Illustrations ..... $1 50

### *The Explorer's and Assayers' Companion.*

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid ..... $6 00

### *Aaron's Leaching Gold and Silver Ores.*

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid ..... $3 00

### *Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid ..... $3 00

### *The Lixiviation of Silver Ores with Hyposulphite Solutions.*

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth ..... $3 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

### *Modern Copper Smelting.*

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated ..... $5 00

### *The Metallurgy of Gold.*

By M. Eissler. Profusely illustrated ..... $5 00

### *Losses in Gold Amalgamation.*

By W. McDermott and P. W. Duffield ..... $2 00

### *Electricity in Mining.*

By Sylvanus P. Thompson ..... 80 cts.

### *Practical Treatise on Hydraulic Mining.*

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid ..... $5 00

### *Practical Hydraulics.*

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid. $2

### *Hydraulic Gold Miner's Manual.*

By T. S. G. Kirkpatrick. With plates and cuts ..... $2 25

### *Manual of Hydraulic Mining for the Use of the Practical Miner.*

By T. E. Van Wagenan ..... $1 00

### *The Sampling and Measurement of Ore Bodies in Mine Examinations.*

Well printed on fine paper, with plates; complete. Price, postpaid ..... 25 cts.

### *Manual of Mining.*

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth ..... $4 00

### *A Text Book of Mineralogy.*

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth ..... $3 50

### *Manual of Determinative Mineralogy.*

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth ..... $3 50

### *Metallurgy of Silver, Gold and Mercury in the United States.*

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo. ..... $7 50

### *Metallurgy of Silver, Gold and Mercury—Continued.*

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth ..... $7 50

### *Notes on the Treatment of Gold Ores.*

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth ..... $2 00

### *A Practical Manual of Minerals, Mines and Mining.*

By H. S. Osborn ..... $4 50

### *Matte Smelting—Its Principles and Later Developments with an Account of the Pyritic Processes.*

By Herbert Lang ..... $2 00

### *Introduction to the Study of Metallurgy.*

By W. C. Roberts-Austen ..... $4 00

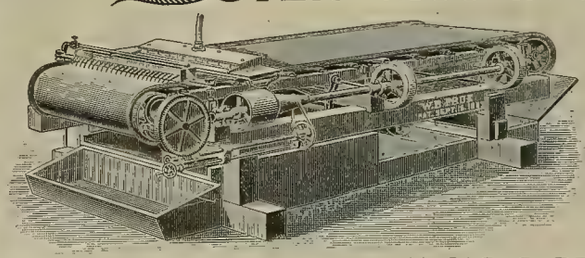
### *Practical Metallurgy and Assaying.*

By A. H. Hiorns ..... $1 50

### *The Practical Metal Worker's Assistant.*

By Oliver Byrne. Illustrated ..... $5 00

### *Quartz Operator's Handbook.*



By P. M. Randall ..... $2 00

# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

## Gasoline Engines and Borax Mines.

Herewith is illustrated a new use to which the gasoline engine has been put, showing a twenty-five-horse power Union gasoline engine attached direct to an air compressor of sufficient size to run three rock drills. This compressor was built by the Abner Doble Co. of San Francisco. It is for use in the borax mines of the Pacific Coast Borax Co. at Daggett, Cal. These engines are becoming a factor in mine development, and have done much to develop many properties which otherwise would have remained non-paying, owing to the lack of fuel in the section.

GASOLINE ENGINE ATTACHED DIRECT TO AIR COMPRESSOR.

Reference to cut shows engine on the right, with a vertical double-cylindered compressor on the left. The plant is self-contained, as both engine and compressor are fastened to one base, and the base is so arranged as to carry the necessary oil, also the igniting batteries. This is the fourth engine that this company has used; it now has three hoisting plants, all driven by Union gasoline engines, and the above-mentioned compressor plant. These engines apparently solved a problem for this company, that had given it considerable trouble. Before the introduction of these gasoline engines the hoisting was done by mule power, and water was so scarce in that section that the drinking water for the animals had to be hauled quite a distance. There are other properties in California that have the same natural difficulty.

The Union Gas Engine Co. recently shipped a twenty-five-horse power engine to the Confidence mine at Death Valley. This property is owned by the Sterling Mining & Milling Co., a corporation of Utah. It appears that it had been known for some time that the property was valuable, but owing to the impediments that nature had placed in the way—scarcity of wood and water—the property remained undeveloped until purchased by the company, and as it had had previous experience with this form of motive power, it knew that no difficulty would be had in operating the property. Having purchased some 150-horse power in various sized engines for use in its several mines, the company knew that the gasoline engine was not an experiment for mining purposes. The recent improvements that have been made in gasoline engines have made them reliable, apart from the readiness with which they can be gotten into motion.

At the Marguerite mine in Auburn, Placer Co., one of these engines is in operation. The engine-room and blacksmith shop are one. The engine is used for hoisting purposes, and when there is a bell from below the blacksmith stops blowing his bellows, starts the engine inside of ten seconds, hoists the load, empties the bucket and proceeds with his work.

PACIFIC COAST BORAX COMPANY'S MINES AT DAGGETT.

Many undeveloped properties that are now standing idle, owing to the great cost of putting in power, could be worked to good advantage with the gasoline engine.

The lower illustration portrays the borax mines at Daggett, where the engine is to go. These mines are owned by the Pacific Coast Borax Co. It is a desert country—a dreary, desolate waste—mule power being almost the sole means of transportation.

This valuable salt is found in considerable quantity in this country only in this State and Nevada. The commercial history of the borax industry on this coast is one of loss and disappointment. Prior to any production being made in Nevada, the price of borax ruled everywhere at 28 to 35 cents per pound, figures that held with but little variation up to 1872, when the price dropped during the next two years as low as 6½ cents in the San Francisco market. After touching this low figure the price of refined borax underwent some slight improvement, and, advancing slowly, reached present rates, 7 to 8 cents per pound in New York. The Nevada producers met with disappointment; their deposits were not fruitful; they were unable to put their borax upon the market in satisfactory shape, the product of their refineries was disposed of hastily and through such diverse channels as soon placed them in the attitude of mutual competitors. These evils and errors developed such obstacles as, in the course of a few years, forced every one of these companies to greatly curtail or wholly suspend operations, the production of borax on the Pacific coast having fallen off before the end of 1879 more than 70 per cent from the largest amount previously made.

In calculating their chances for success, the Pacific coast manufacturers made the double mistake of overestimating their own and underestimating the resources of the foreign producers. It was supposed that the previously prevailing high prices of this commodity the world over were due to a scarcity of the raw material, or to the difficulty of obtaining it in the countries where the principal supply was drawn—a manifest error, inasmuch as the borate deposits of Europe, India and Peru, at the time the new industry was striving for a foothold on the west coast of the United States, were ample to meet all the requirements of commerce. The Pacific Coast Borax Co. is now the largest single producer of this bi-borate of sodium, and is introducing it into general use. Borax is a flux for nearly all metals, a solvent for resins and fats, a cleanser, an antiseptic and a preservative of animal tissue. Its production has increased from 24,304 pounds in this State at 39 cents per lb. in 1864 to nearly 10,000,000 pounds in 1895 at 7½ cents per lb.

## The Accumulation of Amalgam on Copper Plates.

A paper with the above caption was read at the Pittsburg meeting, last month, of the American Institute of Mining Engineers by R. T. Bayliss of Marysville, Montana, which is of practical interest.

Although every millman of even limited experience in the amalgamation of gold ores is probably aware, says Mr. Bayliss, that copper plates will in time become coated by the accumulation of gold amalgam, it may be that many do not know to what extent this accumulation occurs in the treatment of ores dissimilar to those with which they are familiar, and under conditions foreign to those with which they have to contend in any given locality. The writer, therefore, feels relieved from the necessity of offering an apology for dealing with such an elementary subject, believing that certain facts in reference thereto, which have recently come under his personal observation, will be interesting to many, and possibly instructive to some persons engaged in the amalgamation of gold ores. The facts hereinafter stated were observed in the fifty-stamp "combination" mill owned by the Montana Milling Company, Limited, of England, operating the Drum Lummon mine, situated at Marysville, Montana. The material treated in this mill consists of quartz and ores of somewhat variable character, containing gold and silver in native form, as well as in chemical union with the sulphides of iron and copper. There is also present a little lead, some arsenic and antimony, and a little zinc. The last four minerals, however, are of irregular occurrence, and but sparingly distributed throughout the ore, and yield only a trace in the analysis of the average material in this mill. The free gold, which is in a condition of fine division, and rarely visible to the naked eye, carries silver as an alloy; and the native silver, which is only occasionally observed, is present in the richer ores in wire and in leaf form. Of the two precious metals, the ore worked during the past three years and ten months, the period under review, contained about half an ounce of gold, and from seven to twelve ounces of silver, to the ton of 2000 pounds.

The ore, after being crushed in the stamp battery and passed through a thirty-mesh steel wire screen, runs over amalgamated copper plates, and is then concentrated on Frue vanners, to the distributor of which is affixed a small copper plate for saving any amalgam escaping from the battery plate; the tailings from the vanners being subsequently amalgamated in pans. Amalgamation upon copper plates placed inside the mortar is not practiced in this mill, better results having been obtained by amalgamation on outside or apron plates only. It is not the purpose of this paper to enter the wide field of discussion as to the relative merits of inside and outside amalgamation, but it may be observed in passing that an extended experiment upon the two methods proved that a higher percentage of saving was gained by amalgamation outside the battery than by the use of inside plates in addition to the apron plates. The apron plates in use in this mill are 54 inches wide and 8 feet long, made of ¼-inch rolled copper plate, electro-plated with one ounce of silver to the square foot. They are set with a fall of 2½ inches to the foot; are cleaned up once in twenty-four hours, and dressed every two, three or four hours, as may be deemed necessary by reason of their surface condition, which varies according to the mineral contents of the ore submitted to them. In dressing, a weak solution of cyanide of potassium is used when necessary. The copper plates upon the Frue vanners are 46 inches wide and 18 inches deep, made of ¼-inch rolled copper plate, electro-plated with one ounce of silver to the square foot, and are subjected to the same treatment as the apron plates. At the daily cleanup the surface of the apron plates is first washed; then the amalgam which has collected during the preceding twenty-four hours is slightly softened and loosened by sprinkling a small quantity of mercury over the plate and rubbing the surface with a cloth or whisk brush, after which the amalgam is removed with a stiff rubber scraper, 4 inches wide, made out of rubber belting. In this process the daily accumulation of amalgam is removed as completely as possible without the application of a steel scraper, the use of which is not permitted, except for the removal of blisters, or any fixed impurity which may occasionally be found upon the plate. The foregoing brief summary of the method employed in this mill will be sufficient to explain the general conditions surrounding the amalgamation of the free gold contained in the ore, and the treatment to which the copper plates are exposed.

To return to the special subject indicated by the title of this paper: One of the copper plates employed in this mill was recently removed, after having been in continual service for three years and ten months. During this period, the battery of five stamps which it served crushed 14,942 tons of ore, yielding from amalgamation on this plate 6426 ounces of bullion, 541.5 fine in gold and 443.9 fine in silver, giving a standard assay value of $11.70 per ounce, and showing the recovery of $5.03 per ton of ore crushed. In fixing the total tonnage of ore passed over this plate, and the yield in bullion therefrom, the total tonnage and production of the mill during this period has been divided by ten. As all the stamps have been operated continuously, this proportion should correctly represent the duty performed by the particular plate under consideration. The agreeable task of removing the amalgam, known to have accumulated upon this plate (which was new when put in) was then undertaken, and the accumulation or scale was removed by striking the back and front of the plate with a light hammer, a small block of wood being used to deaden and distribute the blow. By this means the plate is slightly buckled, causing the amalgam to scale off, and leaving upon the original electro-plated surface but an insignificant film or layer, which is subsequently removed with a chisel or scraper. Other methods, such as sweating with hot water and immersing the plates in chemical solutions, have been tried, but have proved unsatisfactory; and the process of buckling the plate, although a somewhat drastic and unscientific method, has been found to effect the recovery of the highest percentage of the accumulated amalgam. After this treatment, the plate is usually so damaged as to be unfit for further service; but, notwithstanding that every visible portion of amalgam has been removed, the copper plate is still found to carry a considerable quantity of gold and mercury, and, upon being cut up and melted into a bar, the value of the gold and copper contents amounts to more than twice the value of a new plate, hence the substitution of new plates for old is an expenditure which can be viewed without concern. The results obtained from the foregoing treatment of the particular copper plate here specified were both interesting and of substantial value, the scale or accumulation of amalgam at the head of the plate being no less than 0.16 inch in thickness, and gradually decreasing to a bare one-sixteenth inch at the lower end. The total weight of the amalgam so recovered was 160 pounds avoirdupois, which, upon being retorted, yielded 60.5 pounds, or 38 per cent of crude bullion, and produced after melting a gold bar weighing 866.1 ounces troy, which, upon assay, proved to have a total fineness of 993.9, being 431.4 fine in gold and 562.5 fine in silver, and having a standard value of $9.63 per ounce, thus making the total value of bullion recovered from the accumulated amalgam upon this one plate no less than $8340.54. It may be remarked that the results recorded in this instance are not by any means exceptional. Other plates in this mill, placed in service at the same time as the one forming the subject of this paper, appear to be coated with an accumulation of amalgam of equal weight and value; and, moreover, within the writer's experience of other plates removed from this mill in past years, is an instance in which one plate yielded accumulated amalgam in excess of $11,000. An examination of the facts observed in the course of cleaning this plate, and converting the amalgam into bullion, reveals one or two interesting features which appear to be worthy of record. As stated above, the percentage of bullion in the amalgam obtained was 38 per cent, whereas the amalgam from the daily cleanup never contains more than 20 per cent of bullion, and frequently not more than 10 per cent. This is, no doubt, due to the circumstance that the amalgam remaining upon the surface of the plate is subjected to greater compression than that which is cleaned off, and merely strained through canvas sacks. The accumulated amalgam obtained from the plate in the shape of scale does not appear to suffer any visible alteration in form or size during the process of retorting. A piece one-eighth inch thick and one inch square will pass through the ordeal of retorting and emerge as crude bullion, having preserved, without apparent loss, its original dimensions, and still retaining on its surface any ripple marks or imperfections which it bore during its existence as amalgam. A comparison of the fineness of bullion obtained from the accumulation of amalgam upon this plate with the average fineness of bullion produced from the daily cleanup of the plate, during its service of three years and ten months, of which one would suppose the accumulated amalgam to be a fair sample, shows that, to a striking degree, this is not the case. The average fineness of bullion obtained from daily cleanups during the period mentioned was Au, 541.5; Ag, 443.9; total, 985.4, whereas the fineness of bullion obtained from the accumulation upon this plate during the same period was Au, 431.4; Ag, 562 5; total, 993.9; from which it will be observed that although the fineness of the latter, 993.9, is greater than the fineness of the former, 985.4, the gold fineness is 110.1 less and the silver fineness 118.6 more. That the total fineness of bullion from the accumulated amalgam should be higher than that obtained from the daily cleanups is not a matter for surprise, since the amalgam gathered from the plates from day to day would naturally contain a higher percentage of impurity and base metal than the amalgam which adhered to the surface of the plate; but it does not clearly appear why the gold fineness of the latter should be so much lower than that of the former, the difference being represented by a corresponding increase in the silver fineness. In explanation of this inconsistent feature, it has been suggested that the native silver contained in the ore has a greater tendency to accumulate upon the plates than the free gold, owing to its stronger affinity with the amalgamated surface. If theory furnishes any authority for such a statement, it is rudely disproved by actual experience in this particular instance, for test samples of the accumulated amalgam from the head and tail of this plate prove the former to be .020 finer in gold than the latter, with a corresponding increase in the silver fineness of the amalgam from the lower end of the plate. Furthermore, the amalgam saved upon the copper plates forming the distributor of the Frue vanners invariably shows, upon assay, a lower gold and a higher silver fineness than the bullion recovered from the treatment of the same ore upon the battery plate, a sample of this vanner amalgam yielding bullion assaying Au, 380.5; Ag, 602.0; total, 982.5. In other words, the silver, instead of showing a strong affinity with the amalgamated surface, gives evidence of a persistent tendency to escape amalgamation, as proved by the foregoing assays, which show that the gold fineness of bullion is highest nearest to the battery, and gives place to a steadily increasing silver fineness as the amalgam is deposited upon the copper plates at greater distance from the battery discharge. The natural conclusion to be drawn from these facts and figures would justify the expectation that the bullion derived from the accumulation of amalgam on copper plates would be of equal, if not of higher, gold fineness to that recovered from the daily cleanups upon the plates during the period in which the accumulation was in progress. The foregoing facts, however, incontestably prove that such is not the case; and the purpose of this paper will be served if the facts herein presented, which have been prepared with due regard to accuracy, are the means of suggesting an explanation of this interesting inconsistency, which the writer most frankly confesses himself unable to supply.

## Concentrates.

THE Comstock payroll for February was $84,314.16

THE Waldo, Or., copper mine is working twenty-five men.

OVER 200 men are now employed by the De Lamar, Nev., Mining Co.

THE Morning Star Mining Co., Placer Co., has declared a $6 dividend—its 56th.

THE La Plata and San Juan Miners' Club has been organized at Durango, Colorado.

THE Etna Quicksilver mine in Napa county paid a dividend of 10c per share on the 2nd.

CRIPPLE CREEK, Colorado, is as unanimous as Nevada in excluding Chinese from the mines.

THIS WEEK Rossland, B. C., puts in a claim to the possession of "the biggest gold mine in the world."

THE gold output of Arizona for '95 was $4,250,000, an increase of $2,179,750 over 1894, and of $3,257,495 over 1893.

THE Victorian gold output for '95 was 693,146 ounces; for '94, 674,680; '93, 671,126; '92, 654,456; '91, 576,399.

THREE HUNDRED men are at work on the Rossland-Trail, B. C., tramway. Track will be laid to Le Roi by May 1.

THE Santa Rosa Mining Company of Riverside County has filed a petition in insolvency. The liabilities are $16,000.

THE Checkmate mine in Willow Creek district, Idaho, has been sold to F. L. Chapin, of Ogden, Utah, for $5000 cash.

THE Odin Gold Placer Mining Company of Nevada county has levied an assessment of 50c per share, delinquent March 31st.

THE North Banner Consolidated Tunnel Company of Nevada county has levied an assessment of 3c per share, delinquent March 31st

THE American Developing and Mining Company have removed their main office from their mines at Whitehall to Butte, Montana.

BRITISH COLUMBIA miners are holding mass meetings to protest against the proposed Government 2% tax on the proceeds of the mines.

THE business transacted on the New York Mining Exchange on the 4th was the heaviest since it opened. The total sales amounted to 133,460 shares.

"PURE QUICKSILVER" is reported to the Australian Mines Department as having been discovered near Beaconsfield on the Gippsland line, Victoria.

THE South African *Mining Journal* of Jan 18th suggests as a basis of calculation that 60s.=$15—per ounce be taken as the value of the Randt gold as produced.

THE Northwestern Mining Association urges the addition of a mining secretary to the cabinet. The idea has long been suggested and some day will come to pass.

THE Bullion-Beck, Utah, mine owners have declined to renew any ore contract for '96 and rejected all bids therefor. The present daily output is 100 tons.

A $100,000 FIRE destroyed the mill on Yosemite No. 1, at Bingham, Utah, last Saturday. There was no insurance. Manager P. A. Franklin says he will rebuild.

MINING COMPANIES without number are incorporating in Salt Lake City, Utah. The daily filings of articles of incorporation represent a nominal capital of over $15,000,000.

THE coinage of the United States Branch Mint in this city for the month of February aggregated: Double eagles, $1,240,000; standard dollars, $100,000. Total, $1,340,000.

"TONS OF GOLD!" is what a New York "boom" company advertises. It is located at 80 Broadway, New York City, and has some property in Buckingham county, Virginia.

THE Spring migration to Alaska has begun. Fifty men will leave here next Tuesday on a specially chartered steamer equipped with supplies of all kinds, provisions and machinery.

THE Bendigo, Australia, gold mine has reached a depth of 3,000 feet, at which depth the cost of shaft sinking is $50 per foot. A hoisting engine with a capacity of 4,000 feet has recently been put in.

THE Northern Pacific and Great Northern will make a rate of one and one-fifth fare for the delegates to the mining and immigration convention to be held in Helena, Montana, March 10.

BREEN AND CLARK are buying the machinery for the new War Eagle, B. C., smelter, but decline to say where it will be located. It is assumed that it will be built at Rossland or Northport.

THE Rossland *Miner* says the contract on the Trail Creek tramway was taken at starvation prices and that the men at work are "getting little or nothing more than their board and their board is bad."

NO. 1, VOL. I of the third new mining paper recently started in Salt Lake, Utah, is received. Nothing more strikingly illustrates the present mining activity than the number of new mining papers springing up everywhere.

THE aggregate amount of coin and currency, notes and money of the United States of all forms, Jan. 1, 1896, was $2,197,000,236, the amount in the Treasury was $617,793,512, and that outside the Treasury, $1,579,206,724.

CONSIDERABLE caustic and adverse comment is made on the recently published article on "Ore Treatment," by Mr. W. H. Pellew of Vancouver, B. C. Some of his statements certainly seemed susceptible of successful contradiction.

CRIPPLE CREEK, COLO., barbers charge 50 cents for a haircut. "When whisky was 4 bits a drink" is often reverted to in talking of '49 days in this State. The hair-cut basis of prices may yet form a similar dating point in Colorado chronology.

RENEWED interest is observed in the County Mining Associations. Nevada county has reorganized its Association and sent down $200. Placer Co., which has been the financial backbone of the Association outside of this city, has sent $120 additional.

CONGRESSMAN BREWSTER of New York has introduced a bill to place a duty of 50 per cent ad valorem on silver bullion, or in bars and sweepings; also upon silver bars and ingots and articles and wares composed wholly or in part of silver, whether manufactured or partly manufactured.

IN his semi-annual report the manager of the Broken Hill Proprietary Co. (West Australia) says: "Sales of lead for China have been active, about 5000 tons being shipped, returning satisfactory results. One or two small shipments have been made to America, and your directors venture to think that an opening can be made there for a portion of the output." The kind of national legislation in this country that admits of such a statement in view of all the facts is not calculated to incite respect.

CONGRESSMAN JOHNSON has introduced a bill in the House to amend Section 24 of the Act creating the Federal Debris Commission by adding the clause "*Provided*, That the Debris Commissioner of the State of California shall be ex-officio a member of the Commission created by this Act."

THE Nevada State Land Office has received a Washington transcript of approval list No. 14 of lands situated in the Carson City land district for the two million acre grant, embracing 86,671.69 acres, apportioned by the Secretary of the Interior January 23, 1896, which includes selections made up to June 29, 1895.

THE directors of the Colorado Mining Stock Exchange have adopted resolutions advising the public "to be cautious in the purchase of mining stocks, unless the mines and their members are known, and the stocks are listed on this or some other reputable and long-established exchange, with strict listing rules."

THE Arizona *Silver Belt* says the sale of the Rosemont copper mines to the Lewisohn Brothers of New York will do much to revive copper mining in the Santa Ritas. The company has unlimited capital, and the mines will be opened properly and worked to the best of advantage. The price is understood to be $35,000.

THE current number of the *Canadian Mining Review* crucifies "The Dominion Gold Mining and Reduction Co.," an English mining corporation of questionable standing, which has the audacity to ask of the Canadian Government a cash bonus of $10,000 and $1 per ton for ore treated at the company's "reduction works" at Rat Portage.

THE mint at Carson, Nev., will not be abolished. Director of the Mint Preston and the Treasury officials before the committee on appropriations gave it as their opinion that the mint was a needless expense to the Government, but Congressman Newlands induced the committee to recommend the usual appropriations to run it another year.

A CHICAGO dispatch says Ex-Gov. Van Arman, of Arizona, has succeeded in organizing a placer mining company at Chicago with a capital stock of $2,000,000, for the purpose of investment in a California mining enterprise, which makes a good stand-off to the organization in this city of a million-and-a-half California corporation to operate in the mines of Cripple Creek, Colorado.

TWO NEW PARTS of the Geologic Atlas of the U. S. are received, the Smartsville and Marysville folios, comprising the topography and the economic geology of portions of Butte, Sutter and Nevada counties, superbly produced with colored maps, similar in style and finish to those already received. The descriptive text is by Waldemar Lindgren and H. W. Turner, and is of accurate value.

GENERAL MANAGER KNIPPENBERG of the Hecla Consolidated Mining Company, Glendale, Montana, reports that for the year ending December 31, 1895, the company's mines at Hecla produced 4,919 tons of first-class, and 1,186 tons of second-class ore, at a total expense for labor, timbers, wood and charcoal of $112,591.79. The net profit for the year was $7,333. The cost of mining the first-class ore was $22.91 per ton.

UNITED STATES CONSULAR-AGENT MANYON at Johannesburg has made a report by cable to Secretary Olney, that the Transvaal Government shows every disposition to treat the prisoners leniently, and has a cordial and friendly feeling toward the official representatives of the United States. John Hays Hammond and the other American prisoners are now in Johannesburg awaiting legal proceedings.

THE Sierra county, N. M., *Advocate* calls attention to a trick, not uncommon in these days of leasing, to cover up an ore body or pocket while the mine is in the hands of the novitiate owner, report the mine as "no good," "too low grade," or "played out," and afterward get a lease on the property and stope out the ore which was clandestinely hidden. This is usually done by the connivance of an unscrupulous foreman, often with the innocent collusion of miners under him, who are not acquainted with the ore.

FORT STEELE, B. C., MINERS know what they want and are not slow to ask for it. They have memorialized their provincial parliament, asking to have it take up the abuses of claim jumping, delinquent partners' assessment work and repeal of the act taxing mineral claims until they become wealth-producing. They want a grub-stake law which will require persons grub-staking prospectors to record the same, which will avoid trouble afterwards, and are opposed to the granting of wholesale privileges to individuals regarding water rights, etc.

THE contest of A. P. Tinsley of Springdale, Wash., vs. the Northern Pacific is decided against the corporation, and the railway's selections is cancelled for sections 6, 11 and 15, township 30, range 38, Summit mountain range, the land being more valuable for mineral than for agricultural purposes. This is the first of the mineral land protests to be finally decided in that State; the case in question has acquired considerable notoriety, Attorney Cooney for the Northern Pacific testifying that, from a personal examination of the land, he did not regard it of value for mining.

STATE MINING INSPECTOR C. S. SHOEMAKER of Montana says that in his annual report he will recommend the use of indicators showing the engineer at what station the chairs are in, for all mines below a certain depth and working more than a certain number of men. The only mine these indicators are in use at the present time is the Drum Lummon. He will also recommend the abolishment of all crossheads in mines working below 200 feet deep where the work is of a permanent nature, and advocates the passage of a law prohibiting the use of buckets for hoisting purposes in any mine shaft of more than 200 feet in depth.

THE Pueblo, Colorado, *Opinion* states that tin ore has been found near the city in a very pure state and in vast quantity, and that tin smelting works will probably be erected in that city before the close of the year. The Georgetown, Colo., *Courier* says: "It is rarely that a month passes without the announcement of the discovery of tin ore somewhere in the State. If all these announcements are facts, tin is found along the base of the mountains in every county from Wyoming to New Mexico. Unfortunately these announcements are not backed up by the facts, and the Pueblo discovery may never be heard of again. The only authentic discovery of tin ore in Colorado was on Devil's Head mountain, in Douglas county. It occurs in small crystalline masses less than an inch in diameter, imbedded in quartz. A few isolated crystals have been found on amazonstone in the Pikes Peak region, but their identity has not been fully established. They may prove to be rutile, the oxide of titanium."

THE Park *Record* complains that Utah mining men and most of the papers are rapidly becoming gold blind, and the result is that silver camps are gradually falling away in the interest commanded at both the hands of capital and the leading papers. The big silver properties in operation are of course pushed along and are occasionally noticed by clippings from the local papers, but the many valuable prospects that have the making of good silver mines are seld om seen in print outside of the camp publications. At the same time a sample from a gold prospect showing a $1.50 assay is boomed by individuals and papers until the outside world is almost forced to believe that it is a fabulously rich mine. It is not right, and both papers and interested parties should exercise more care in their statements.

THE South Africa United States Consul Hollis in a report to the State Department from Mozambique says that seven or eight years ago the mining industry in the Transvaal was in about the same condition as to development as that in Mashonaland to-day. Now they are turning out $42,000,000 gold per annum. He also declares that mines in Mashonaland are being more rapidly developed than those of the Transvaal were in the early days. Mining experts tell him that the gold reefs in Mashonaland and Matabeleland are, on the whole, richer and more extensive than those of the Transvaal, and there is no reason why these countries, along with Manica Safola, should not soon rival the Transvaal in gold production. Consul Hollis seems to be badly misinformed regarding the aggregate yield and the other allegations.

AT the drilling contest at Leadville, Col., February 24th, C. O'Neal and M. Sullivan of Leadville, in fifteen minutes, sunk a drill 32 1-16 inches into the granite. J. McKee and T. Sullivan, when time was called, had made a hole 36 5-16 inches deep. Landers and Rabideau of Gilman scored 31 13-16 inches. Bradley and Hill of Silver Cliff drilled 27½ inches. Driver and Kreeger of Butte, Montana, made a record of 33 9-16 inches. M. Burns and J. Burns of Leadville drilled 37 1-16 inches and won first money. The record in Gunnison granite up to that time was 35½ inches, made in the same rock at Knights of Labor Hall a year ago by McKee and Dwyer. The next best performance in that rock was made at the Festival of Mountain and Plain last fall, when O'Neill and Sullivan put in the steel 35 5-16 inches. Leadville now claims the championship of the world.

PROBABLY no organization in the country is carried on with as little expense as the California Miners' Association. Apart from contributing their services gratis to the cause, the officers and members aid in forwarding the Association's interest in every way possible. Even the ordinary expenses of rent, fuel, etc., are not charged. Secretary Sonntag, who holds the only salaried position, pays his own expenses, furnishes an office, fire, etc., and draws no salary. So also with Jacob Neff, S. K. Thornton, Andrew Carrigan, W. W. Montague, W. C. Ralston, and, in fact, everyone connected with the organization. The California Miners' Association has no "organ," and makes little display or announcement, but is constantly at work in aid of the mining industry of the State without prejudice to any other State industry or calling. It is the exponent and central working force of the several County Mining Associations of the State, and upon the zeal and activity of the latter depends largely the success of the central Association and its Executive Committee.

REPRESENTATIVE ALLEN, of Utah, and Senator Cannon of the same State, have jointly introduced a bill to amend Section 2335 of the Revised Statutes by providing that "All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in any State or Territory in the United States having an official seal, and all testimony and proofs may be taken before any such officer, and when duly certified shall have the same effect as if taken before a register and receiver of a land office. In case of contest as to mineral or agricultural character of land the testimony and proofs may be taken under such notice and regulations as the Commissioner of the General Land Office may prescribe, provided that the presence of rock (in place) or of deposits bearing gold, silver, cinnabar or other mineral shall be regarded as prima facie evidence that the land containing the same is mineral in character; provided, further, that in investigating the character of land, with a view of ascertaining whether it is more valuable for mineral than for agricultural purposes, evidence may be taken of mineral discovered and developed adjacent to such land, proof of which shall be corroborative evidence that the land in question is mineral in character; provided, further, that when the land is proved to be within a well-defined mineral belt it shall be deemed prima facie evidence of the mineral character of said land."

THE mineral land bill in the Senate is not in satisfactory shape. Those who understand the requirements of the situation are trying to get it through the Senate without any amendments, but its fate is uncertain. Senator Mitchell, of Oregon, proposes to tack on an amendment making its provisions applicable to Oregon. Senator Wilson, of the State of Washington, also announces his intention to have an amendment to the California bill applying to his State. While it is not to be assumed that these men want to kill the bill, yet Pacific Coast Senators are presumably acquainted with the fact that such proposed amendments will prevent all hope of its passage. In the 53rd Congress, when the Idaho-Montana bill was going through, California's Senators said they would like to have it amended to apply to California: it was pointed out by Idaho and Montana Senators that might endanger the passage of the bill, and that if California would wait, a bill could go through the 54th Congress. California miners waited, the promised bill is now on its passage, it got through the House, and can get through the Senate to receive the President's signature if it is given a show. As to the Oregon part of it, Congressman Herrman and Senator McBride of that State are now getting a separate bill through Congress creating a similar commission for our sister commonwealth. The railroad people are going ahead with applications for patents for thousands of acres of the very land under discussion. They are applying now for great tracts, at present advertised in Trinity, Shasta and Siskiyou counties. If the bill can emerge unamended from the Senate committee, it has an excellent chance of passing the Senate as it came there, and if the United States Senators mentioned have, as they profess, the interests of the miners at heart, they will aid in having it go through; otherwise, otherwise.

## The World's Greatest Gold Lode.

Written for the MINING AND SCIENTIFIC PRESS by DAN DE QUILLE.

To-day is in progress a more world-wide search for gold than has ever before been seen in all the ages that have passed since the history of our race began to be written. In times past there have been gold mining excitements in various countries, but they have mostly been confined to the region in which the mines were situated. Now, however, gold and gold mining seem to be that which is uppermost in the thoughts of the people of nearly all countries and nations, civilized and savage. All the world is out gold hunting. Fearless and enterprising men are at the front leading the way. The mountains and wilds of almost every known land on the face of the earth, however remote and savage, are being explored in search of the yellow metal. Neither the malaria of the tropics nor the ice of polar regions can turn back or terrify the invading armies of gold hunters. Everywhere bands of courageous and hopeful prospectors go "marching on."

The countries in which the greatest activity in gold mining is now seen are South Africa, America and Australia. The gold fields that have made most noise in the world—particularly in the leading cities of the Old World—in the last year or two are those of South Africa and West Australia. Australia, however, was only a fair second—South Africa was the grand field of European excitement until the late troubles at the Rand began. During the time of the opening of the mines of the Rand and other South African gold fields and the building up of great and flourishing mining towns times were bad and dull in the mining regions of the Pacific coast among those engaged in mining for the precious metals. Government had given silver a "black eye" and the demoralized miners who found their property wiped out and their occupation gone had not yet plucked up heart and turned their attention to mining for gold. Thus this country, which should have held the first place in the whole world in the production of gold, fell behind the new fields of South Africa, in which more activity was displayed and an almost unlimited amount of capital brought to bear. It is not because of the richness of the ores of South Africa that she has pushed a little way to the front, but because of the great number of mines opened, each of which is producing more or less gold. Along the edge of the Rand basin hoisting works and mills are planted two or three tiers deep.

Now, as it is the number of productive mines, big and little, that count in the grand total, the Pacific coast region must very soon surpass every known country in gold production. We have thousands and tens of thousands of veins of gold-bearing quartz in every State and Territory on the coast, from the borders of Mexico to the frozen regions of the Arctic, and as these are opened over thousands on thousands of square miles of fertile mineral belts, all that is now doing or ever can be done in the circumscribed area of the Rand basin will appear quite insignificant in comparison. What is wanted is a full awakening to the value of our possessions and the thorough development of the wealth of gold that lies hidden in our mountains. A start has been made in the work of opening up the gold veins of the Pacific coast region and, though it is little more than a start, already some wonderful discoveries have been made in all parts of the country, with a find of such rich mines at Cripple Creek, Colorado, that a boom has been started almost rivaling that seen in South Africa. At Mercur, Utah, another great auriferous deposit has been found that gives promise of building up a large and rich mining town. In both States there are probably lying untouched other gold belts that are equally rich—also in Idaho, Nevada, Arizona, and other sections—and to be equally productive only require the bringing to bear upon them of men and capital.

In every Pacific coast State and Territory are found veins of gold-bearing quartz that are wonderfully rich, also auriferous belts of considerable extent made up of systems of parallel veins, but the greatest field of America—indeed, of the known world, at the present time—is that of California. Just at present California may be a little behind one or two of the more famous regions of the world in gold production, but it is merely because of her long halt in the industry of mining—because of the many years during which capital was diverted from the mountain regions, when the development of mines almost ceased. The war upon the miners of California by the ranchmen of the valleys and the suspension of hydraulic mining under adverse decisions of the U. S. Circuit Court gave mining of all kinds a "black eye." With the defeat of the miners came an agricultural and horticultural boom during which no man of means thought of anything outside of speculation in ranch lands, orange groves, and irrigation schemes. Thus it happened that for a dozen years or more—nearly fifteen years—California was resting on her "ores," and her ancient honors. Men who had money left the mountains and went down into the valleys to participate in the boom in orange lands, while those who were left poor by the shutting down of the hydraulic mines eked out a subsistence by drifting in their gravel banks or by scraping over old bedrock. Here and there the old productive quartz mines in a few leading camps were at work, but little was anywhere being done for the development of new mines. Mining was under a cloud and at a discount. Groves of golden oranges for a time drove from the minds of men visions of nests of golden nuggets. The wealth of the mountains was sacrificed to the wealth of the valleys.

Recently, however, hydraulic mining, under certain conditions, has been resumed and in places a return of the prosperity of the olden days is beginning to be seen. The development of the quartz veins of the country has been commenced and already there is to be seen quite an awakening to the value of the golden stores of the mountains, so long slighted and almost ignored. At several points there is considerable activity in prospecting, resulting in the opening of new and valuable mines, but in hundreds of other places throughout the State where the indications are equally promising the lodes lie undeveloped. Also there are probably as many veins remaining to be discovered as are anywhere seen on the surface. There is no lack of mining ground in California. Within the borders of the "Golden State" alone there is room, in the quartz mines, and the hydraulic and drift diggings, for every miner of the precious metals now engaged in the industry on the Pacific coast. The great mother lode, which was formed contemporaneously with the upheaval of the Sierra Nevada range, extends in an unbroken line along the western slope for a distance of over 120 miles. It is not a single lode but a system of parallel veins forming a mineral belt in places twenty-five to thirty miles in width. Through this auriferous belt runs that which is known as the mother lode. It is the backbone of the system of parallel veins and by certain "ear-marks"—peculiar characteristics found in the wall rocks—it is traceable along nearly the whole western slope of the Sierra Nevada range. Through county after county it runs—Tuolumne, Calaveras, Amador, El Dorado, Placer, Nevada, Sierra, Plumas, Shasta, to where the Sierra Nevada and Coast ranges unite in Siskiyou, up near the Oregon line—constituting the richest, strongest and greatest single deposit of gold-bearing quartz in the known world. Along the mother lode, between Mariposa and Siskiyou, there is room for fifty such gold mining camps as that of Cripple Creek.

For years the great auriferous region has lain fallow, but the day is not distant when the whole belt along the course of the big central lode will swarm with miners. To-day in every county through which the big lode passes there is room on it and its accompanying veins for thousands of miners, while in several counties to the northward there still remains to be opened and worked, by hydraulic or other process, many rich gravel deposits, with miles on miles of the channels of dead rivers under the lava-capped mountains to be opened up and drifted out. The prevailing opinion in the world at large is that the placers—the auriferous gravel deposits—of California were worked out years ago. This is a mistake. Most of the shallow diggings have for some time been exhausted, but in the big, deep gravel deposits and in the channels of the ancient rivers beneath the mountains there still remain hundreds of millions.

Experienced prospectors always expect to find large and rich veins of gold-bearing quartz somewhere above rich and extensive placer diggings, the rule being the bigger and richer the placers the bigger and richer the vein or veins from which was thrown off the gold found below in gravel deposits. This being the case, nowhere in the world can there be found a more promising region in which to prospect and mine than that along the line of the mother lode, below which has been gathered more placer gold than from any other single gold field in the known world. When hundreds of millions in gold was dislodged from the croppings through weathering and erosion what must have been left behind in the veins themselves? There must lie in the lodes a still greater store of wealth than that brought to light by the chance action of the elements.

However, there is no uncertainty in regard to either the richness or permanence of the great California lode. At several points it has been sufficiently well prospected to show that it is everywhere fertile and reliable, though gold may not everywhere be found on the surface. At Grass Valley, Nevada City, Sonora, Angels, and other places, mines have been opened on the big lode that have yielded millions and are still paying as well as at first, some much better than when first opened. The fact that some of these mines have been worked from thirty to forty years and have attained a depth of over 2000 feet, without showing any indications of exhaustion, tells well for the permanence of the big vein. There is no reason why the lode may not be worked to the depth of 5000 feet, with the improved apparatus of all kinds now available.

Although the big lode is paying so richly and is so thoroughly prospected at a few old camps widely separated, there are in every county miles on miles along its course where little or nothing is being done in the way of opening mines upon it. In El Dorado and other counties to the northward great stretches along the vein are lying idle, though good prospects can be obtained at the very surface. Such claims as are located are mostly held by men who are able to do little more than the necessary assessment work; they were quite unable to procure machinery with which to do real development work. Along the range are many mines on which some work was done in the early days, and most of these lie much as when abandoned years ago.

In all the world there is no better place in which to mine than on the big mother lode gold belt of California. No richer mines can be found in any country on the face of the globe; the gold field lies in the midst of civilization; the climate is perfection; provisions of all kinds are abundant and cheap, and mining supplies can be easily and cheaply obtained. The man who runs away to South Africa, to frozen Alaska, or to the malarial camps of South America, while there is such a field for prospecting and mining here at home in the heart of California, is "wild as an Apache."

The big gold belt of California has a great advantage over South Africa, Australia, and most other gold fields of the world in its abundant supply of timber and water. Immediately along and above the lode are the inexhaustible forests of the Sierra Nevada range, from which may be cheaply obtained mining timbers and fuel. Then all along the range are creeks and rivers that rush down to the west to the great valley regions. Among the rivers may be mentioned the Feather, Yuba, American, Mokelumne, Stanislaus, Merced, San Joaquin and Kings. There are some smaller rivers and many large creeks and canyons that carry considerable volumes of water. All these rivers and creeks, on their way to the valley regions below, cut across the line of the mother lode, and as they have their sources in the high Sierras they are, in their downward course through the mountains, filled with falls and rapids, therefore an abundance of fall may be obtained on all the streams of the region for driving machinery by water power. By means of electrical transmission this power may be used in running the machinery of the mines and mills along the big lode. Indeed, electrical apparatus is already in use at some points, and much machinery is being run by power electrically transmitted. Eventually great numbers of dynamos will be strung along the rivers and creeks, and wires will convey power all about the mountains, making it available in places to which it would be impossible to carry water, for use in driving machinery. That he was unable to make water run up hill was always a matter of regret and humiliation to the miner of the early days; now, however, by the aid of electricity, we are able to lift a big water power from the bed of a river and set it going hundreds or thousands of feet above on a mountain top.

Had the great lode been made and planted to order, it could not have been more advantageously placed for cheap working. Then, with the new and powerful explosives, the machine drills and air compressors for use underground, improved winding gear for handling the rock, improved pumps for handling the water, and improved ore-reducing apparatus and concentrators, with new and cheap processes for the extraction of the precious metals from the pulverized quartz, hundreds of veins that could not be touched by the early miners may now be profitably worked. Mining ground on the mother lode will never be worth less than at present. The immense value of this greatest of all gold-bearing veins is just beginning to be understood, notwithstanding the millions on millions that have been taken out of it from mines opened on it here and there in years past, and the millions that it is still regularly yielding. Whoever now secures a paying mine on the great California mother lode may consider himself fixed for life; he will have a piece of property it will do to "tie to."

Although California has produced over $1,300,000,000 in gold, the source of this immense yield of the yellow metal up in the big gold belt along the mother lode has only here and there actually been tapped in accordance with the rules and methods of modern scientific mining. In other places, for miles on miles, where touched at all, it has merely been scratched over on the surface. Had the English a giant lode such as this of California in South Africa, Australia, or in any of their possessions, as well proved up in value as it is, both by the hundreds of millions taken from the gravel deposits below its croppings and the millions on millions that have been taken and are still being taken from the lode itself at a few points—had the English such a gold belt anywhere, it would be all town from end to end and in every part would be filled with swarms of people. The Comstock was packed with people in the bonanza days, though the productive portion of the vein was only about two miles in length; the mother lode would make fifty Comstocks. It may be thought that paying mines can only be found in the few places where the lode is now being successfully worked, but the immense amounts of gold mined in the whole tier of counties through which the big vein runs shows that it sent down to the placers about as much gold in one place as in another. At the south end Tuolumne county has yielded about $220,000,000; Nevada

county, toward the center, about $250,000,000, Sierra county, to the northward about $200,000,000, and other counties in about the same proportion. These yields show that the great lode is alive and fertile through its whole course.

Outside of the main mineral belt of the mother lode are, in many places, independent systems of gold-bearing veins and many of these contain fine, paying mines. To the southward, in the southern counties, even in the desert regions, some wonderfully rich mines are being discovered and opened. In almost every part of California, in the mountains and foothills, gold-bearing quartz veins are found, and many of them constitute fine, paying properties.

To-day, a man may find any kind of mining he desires to engage in. Beginning with Placer county he may find big drift diggings all along up to Siskiyou, the ancient river channels beneath the lava-capped mountains, in many places, as Nevada, Sierra, Plumas and Trinity counties, being almost untouched. In Siskiyou, along the Klamath, are big hydraulic mines and also drift mines. Immense tracts of deep placer ground yet remain to be washed by hydraulic process, which is freely permitted along the Klamath. In this region are also fine, paying veins of gold-bearing quartz. Many big foreign companies—French, English and German—are getting in here and buying up immense tracts of mining ground. They go for placer, drift, quartz—any kind of mines shown to be paying well.

In Siskiyou county is a region which this country should look after. It is an old lake basin which contains an auriferous conglomerate such as is found at the Rand in South Africa. The gold found in this formation is of the heavy, smooth variety, such as is obtained from the channels of the dead rivers. The deposit is very extensive. The western rim is seen to the east of the town of Yreka, and it has been traced north on that side a distance of twenty-five miles and there it enters what is known as the Cottonwood basin, in the southern part of Oregon. The conglomerate formation doubtless extends into the Cottonwood basin. The gold is found in a stratum of blue gravel which underlies the conglomerate. Parties who have examined this deposit say it is of the same character as that of the Rand. There is in this section of country a small system of lakes and it may be that the basin containing the auriferous conglomerate represents an ancient lake that was filled with lava-like material by some volcanic convulsion, the country being full of old cones and crates, or it may have been filled up by glacial action, as evidences of glacial erosion are abundant in all that region. Be this as it may, gold is gold wherever found, and here is evidently an immense auriferous deposit that is worthy of critical examination by the best experts. We may have here at home a greater and richer golden basin than that which built up the big South African town of Johannesburg.

## A Big "Big Tree."

TO THE EDITOR:—The Puget sound country is famous for its "big trees." But it is not generally known how very large some of the biggest of those "big trees" really are.

In the city of New Whatcom, a seaport town and the county seat of Whatcom county, the northwest county in Washington and in the United States, is erected on the outer edge of the sidewalk on one of the principal street corners an immense slab or section of one of Washington's biggest red fir trees.

The slab, being cut directly across the diameter of the tree, like a butcher's cutting block, is set on edge, the greatest diameter extending upward, the bark all on about its entire circumference.

A stranger naturally feels inclined to walk up to the slab and measure it by his height, and is surprised to find that it would take another man standing on his head to extend to the top of it. Then he steps back a pace and reads the following inscription, neatly painted on a board attached to the face of the slab:

"Tree from Loop's Ranch Forks, Whatcom county, Washington.

"The tree was 465 feet high, 220 feet to first limb, 33 feet 11 inches in circumference at the base.

"If sawed into lumber, would make 96,345 feet.

"Would build eight cottages, two stories high, seven rooms each.

"The tree is about 480 years old, according to the rings.

"If sawed into inch square strips, would fill ten ordinary cars.

"The strips would reach from Whatcom to China."

The section shows the tree sound to the core.

HENRY W. BROWN.

Custer, Wash., Feb. 24th, '96.

FOURTEEN MILLION FEET OF LUMBER will be required to double deck the stock yards at Chicago. The first contract for supplying a million and a quarter feet was let recently. Work will be commenced in April.

WE do not see the moon as it is, but as it was a second and a quarter before. Were the moon dispersed into atoms, we should still see it entire and perfect for more than a second.

## Mining Titles on Spanish Grants in the United States.*

BY R. W. RAYMOND.

The "law of the apex," with its vague and impracticable "extra lateral rights," is defended—if it is defended at all—on the ground that it is required by the peculiar conditions of the mineral deposits or of the mining industry in those States and Territories in which it is operative. As I have repeatedly attempted to show, in papers read before the Institute, and most recently in an article on "The Relation of the Mining Law of the United States to the Development of Its Mineral Resources," published in Mr. Rothwell's *Mineral Industry* for 1894, there is now (whatever may have been the case formerly) no peculiarity of conditions in the regions referred to which warrants the subjection of their mining industry to a burden so vexatious and injurious as this law imposes. I have called attention to the absolute freedom from expensive litigations over mining titles enjoyed by all other States in the Union and all other regions in the world where the absurd extra-lateral right does not exist. Certainly, it will not be contended that the metalliferous deposits of our public domain in the West are radically different in kind or form from those which are successfully exploited elsewhere under the operation of the simple principles of common-law boundaries. Even in the territory still afflicted with "the law of the apex," that law is not applied to coal mines, though in some cases coal seams are mined which dip more steeply than many of the most productive "lodes." It might be supposed that the absence, in such cases, of all litigation concerning the boundaries of mining rights would be instructive and suggestive to the owners of metal mines in the same regions, leading them to desire a similar certainty of ownership for themselves.

Yet it remains true, on the whole (though for a smaller portion of the citizens than formerly), that proposals for a change in the existing law are unpopular in the West. The opinion of intelligent lawyers, I think, has come very generally to favor the adoption of the vertical boundaries which work so well everywhere else in the world. But lawyers, as such, have no direct interest in putting an end to the system which gives them so much profitable business; and although I feel sure that the members of that profession, if consulted, would frankly express the view I have ascribed to them, it is scarcely to be expected that they should engage actively in the agitation of the subject. The late Mr. Symes of Denver, entering Congress as a Representative from Colorado, after a long experience as counsel in mining litigation, introduced in the House of Representatives a bill providing for the future location and sale, on the public domain of the United States, of mining claims with vertical boundary planes, and encountered, as a consequence, the vehement disapproval of his constituents, or, at least, of such of them as chose to express themselves through mass meetings. The bill failed, as had failed also the earlier bill to the same effect, framed by the Public Lands Commission in 1880. In both instances the cause of failure was the hostility to the proposed reform exhibited by the communities affected. It is not my purpose here to analyze in detail the sources and reasons of this hostility; but I may be permitted to offer a very general statement.

We my roughly divide the Western communities in which this sentiment is manifested into three classes: Those who own mines; those who hope to own locations of speculative value; and those who profit indirectly by the mining industry. The first class would not be affected by a change in the law, since such a change would not affect vested rights. The second class, comprising a much larger part of the population, is afraid that the proposed change in the law would diminish the chances and rewards of the prospector; and the third class, impressed by this attitude on the part of the second class, and feeling that anything which hinders activity in prospecting will react unfavorably upon general trade and the value of real estate, gives at least a passive support to the demand of the prospectors.

We have, then, to deal with the feeling of the prospectors as the true kernel of the difficulty; but in this class must be included not merely the individuals who are, at any given time, ranging the mountains in search of promising outcrops, but also those who are, as partners, paying their expenses ("grub-staking" them), and also those who are earning wages, but who intend to go prospecting when they have saved enough to furnish them for such an excursion. To take the State of Colorado as an example, I think I may say that almost all the miners working for wages are also from time to time prospectors, and that almost all the merchants are from time to time supporting prospectors or acquiring property in undeveloped mining claims, so that the interest of the prospector is really shared by a large part of the population.

I must include in this class also (although they are not worthy to be ranked with honest explorers) those who make locations on the outskirts of valuable claims for the express purpose of piracy or blackmail, and those who support them by furnishing for vexatious litigation the means which would not be forthcoming for honest mining. These people thrive on the ambiguities and complications of the mining law. If it were made simple and clear, their occupation would be gone. There is no doubt, therefore, on which side they stand. But disregarding them, let us consider the interest of the bona fide prospector.

Since it happens but seldom that a mine pays "from the grass-roots down," the prospector must be aided, in most instances, with the capital necessary for development. Even when his own labor in prospecting pits and drifts is repaid by the ore incidentally produced, the time soon comes when capital is needed for operations on a large scale. As a practically universal rule, prospectors work in the hope of selling their claims or interests therein. If the law should be so changed as to give them claims twice as large as they can now locate, but, at the same time, forbid transfer of title by sale, the business of prospecting would be ruined. Everybody knows that. Moreover, the sellers of mining claims to non-resident purchasers have found out that U. S. patents are required to make the titles acceptable. Everybody knows *that*, too, and everybody has submitted to it. But under the present law, the United States patent does not give a satisfactory title. It is "iron-clad" and invulnerable as to what it actually grants, but what that is it does not set forth, so that a purchaser can know what he is buying. The consequence is that, by reason of this cloud upon title, mining claims cannot be sold so easily or at as good prices as if the title was more completely defined. This is a distinct injury to the prospector more than to any other party concerned. The other victims have their escape, if not their remedy. The Eastern or English company which has bought a good mine, only to lose its profits in litigation, can buy mines in some better-governed country; but the prospector who finds it harder and harder to secure foreign capital, can only give up his barren trade. Just now immense sums are forthcoming for the purchase of mines in South Africa and West Australia. Can there be any doubt that the investment in those regions of hundreds of millions, without a single instance of litigation over boundaries, such as blights our West, has been an object-lesson of much significance to English capitalists? Can there be any doubt that if the Witwatersrand had been located in Colorado, instead of South Africa, there would have been, long before this, a crop of lawsuits over apexes, side-lines, strikes, dips, faults, vein-matter, assays, theories of formation and subtle expert distinctions which would have choked the new industry and corrupted the atmosphere surrounding it?

Such considerations ought certainly to have weight with our prospectors; but they are short-sighted, and need to have object-lessons nearer than South Africa or West Australia, or even the Carolinas and Georgia, or Michigan and Wisconsin, or Missouri, or British Columbia. I am very glad, therefore, that the practicability of the "square location" can be illustrated in the heart of Colorado.

Under the famous California decisions, confirmed by the U. S. Supreme Court, a patent from the United States, issued in confirmation of a land grant from the former Government of Mexico, invests the patentee with the ownership of the precious metals which the land may contain. The owners of these old Spanish grants have, therefore, the power to make such regulations for the sale or working of mines as they may deem advisable. In most cases, I believe, they have followed the apex feature of the United States law, fearing to arouse local prejudices by departing from local usage. This is the case, if I am not mistaken, upon the Cerrillos and Maxwell grants in New Mexico. But the proprietors of another similar estate have adopted what seems to me to be a wiser policy, as the following proclamation shows:

NOTICE TO MINERS AND PROSPECTORS.

The western slope from the summit of the range of mountains forming the eastern boundary of the San Luis valley, and extending southerly from a point in the neighborhood of old Fort Garland, into New Mexico, is included in what is known as the Sangre de Christo grant, and is *patented* land.

Beginning at a point nearly opposite the town of San Luis, the county seat of Costilla county, Colorado, this range of mountains, to the summit thereof, and in some places beyond the summit, and to the boundaries of the Maxwell grant on the east, is the property of the United States Freehold Land and Emigration Company, the title of said company being perfect and undisputed. Said range of mountains, from specimens of float ore, found from time to time, is known to contain numerous mineral-bearing veins and lodes, and is believed to be rich in precious metals.

The United States Freehold Land and Emigration Company now throws open to prospectors its lands in said range, in Colorado and New Mexico, upon terms more reasonable than those offered by the United States Government. (See Mining Regulations below.)

The country is very accessible, and may be easily reached by good roads from Garland, on the Denver and Rio Grande railroad. For particulars, apply to

E. C. VAN DIEST, Manager, San Luis, Colorado.

*Mining Regulations for Prospectors and Intending Locators Upon the Lands of the United States Freehold Land and Emigration Company.*

Notice is hereby given that the lands of the United States Freehold Land and Emigration Company, situated in the county of Costilla and State of Colorado, and county of Taos, Territory of New Mexico, are thrown open to prospectors for the discovery, location and actual ownership of mineral-bear-

*Read at the Atlanta meeting of the American Institute of Mining Engineers.

ing veins, lodes and deposits (except such as are chiefly valuable for coal and iron), under the following regulations:

SECTION I. The discoverer of any mineral-bearing lode, vein or deposit within the limits of the estate now owned by the company may locate a claim upon said vein, lode or deposit, 1500 feet in length along the supposed course of said vein, lode or deposit, by 150 feet on each side of the point of discovery of such vein, lode or deposit, by posting a notice at the point of discovery, giving the name of the claim, the number of feet claimed in each direction from the point of discovery, the name or names of the locator or locators, and the date of discovery, and by filing a copy of such notice in the office of the company at San Luis, Colorado. (No fee for filing such notice will be charged during the years 1891 and 1892, but on and after January 1, 1893, a fee not exceeding three dollars will be charged for each notice.) Blank forms of notices will be furnished to intending locators free of charge.

SEC. II. The extensions for 1500 feet in length by 300 feet in width along the vein, lode or deposit, each way from the end-lines of every claim so located, shall remain the property of the United States Freehold Land and Emigration Company, and shall not be subject to location, under these regulations, but may be negotiated for and purchased upon terms mutually satisfactory to the company and the purchaser.

SEC. III. The locator or locators, upon filing the notice of their claim provided for in Section I, shall, within sixty days from the date of such filing, determine as nearly as may be the extent and course of the vein, lode or deposit claimed by them, and mark the bounds of the claim upon the ground, by stakes or other readily distinguished monuments, one of such stakes or monuments to be set as nearly as may be at each corner and one at the center of each side-line of the claim, and shall, within the time aforesaid (60 days), file in the office of the company at San Luis, Colorado, a plat of the said mining claim, showing the supposed course of the vein, lode or deposit, and the number of feet claimed along the strike of the same in each direction from the point of discovery, which plat must connect said mining claim with the surveys of the company, or with some locating monument to be established by the engineer of the company. (No fee will be charged for this filing.)

SEC. IV. Except as modified by the consent of the company, or by prior contracts or conveyances, each claim shall be 1500 feet in length by 300 feet in width. The side-lines of the claim must be parallel with each other, and except as provided above in this section, must be equidistant from the point of discovery, but need not be equidistant from the center of the lode, vein or deposit. The end-lines must be parallel with each other.

SEC. V. Within one year from the date of filing the notice of location in the office of the company, as provided in Section I, the locator or locators shall do at least one hundred dollars' worth of work upon the lode or vein, and shall make written application to the company to purchase said mining claim and have an official survey of the same made by the company's surveyor, and shall deposit in the office of the company fifty dollars in payment for such survey.

SEC. VI. Upon completion of the survey provided for in Section V, the company will execute a deed to the surface ground of the mining claim, together with all the minerals contained therein (except coal and iron, as aforesaid), upon the payment to the company of ten (10) dollars per acre for the land contained in said claim, within thirty days from the completion of said survey.

No right to mine beyond the boundaries of said claim (either side-lines or end lines) will be given.

SEC. VII. Priority of location shall govern all awards, but in case of adverse claimants to the same lode, vein or deposit, the company will not undertake to adjudicate the rights of the respective claimants, but will recognize such rights as may be successfully established in the courts, in proceedings between the claimants, provided these regulations have been complied with by the successful litigant.

SEC. VIII. Failure on the part of any locator or locators to comply with any of the foregoing regulations shall work a forfeiture of all rights, and shall be deemed an abandonment of the mining claim.

SEC. IX. These regulations shall not be construed so as to prevent the company from disposing of its unlocated lands as it may deem fit.

UNITED STATES FREEHOLD LAND AND EMIGRATION COMPANY.

Mr. E. C. Van Diest, the manager of this estate, who is a member of the Institute, writes me that two years' experience under these regulations has shown them to work admirably. More than three hundred claims have been located under them, and Mr. Van Diest says that he has met but two persons who objected to the rules. The company provides forms of location certificates and records them in its office. Moreover, the company, as I am informed, maintains a map, showing at a glance what mining claims have been sold or are held under location. When any claim has been forfeited (under Section VIII) prior to its final sale, the map is altered accordingly. I understand that the blue prints of this map are made monthly and furnished to applicants, so that any person desiring to make a mining ocation can ascertain at once what land is free for the purpose. This simple system is in striking contrast with the blundering confusion of the United States law. According to that law the making of a mining location, in compliance with certain rules (which include no notice whatever to the officers of the United States, but only a record with a local State, territorial or county officer, or a "mining recorder"), immediately withdraws from the public domain the land concerned. Not until proceedings for United States survey and patent are commenced (and that need never be done if the locator prefers to hold by annual "assessment work") does the United States Land Office receive any notice of the location; and the maps of the Government to-day represent hundreds of thousands, perhaps millions, of acres as belonging to the public domain which have, in fact, been withdrawn from it and are held by parties unknown. Uncle Sam doesn't know what he has to sell. All he can do for a proposing purchaser is to smile feebly and say: "So far as I know, the land belongs to me. But you must advertise for ninety days, and if nobody turns up to claim the land I will assume that it is mine and sell it to you."

In other words, the United States surrenders to locators on its domain rights and titles of which it makes no record. Such record as there is is made and kept by officials not in its service.

Some of the provisions in the regulations quoted above seem to me unnecessary. I do not see, for instance, why the side lines of a claim must be equidistant from the point of discovery, especially as that point is not required to be on the "apex," and the side lines need not be equidistant from the center of the deposit or parallel with its course. The point of discovery is purely an accident. Why not sell locations of any desired size or shape up to a certain maximum area? It must be observed, however, that the company does, in fact, reserve the right to consent to modifications of form.

The final conveyance is made by warranty deed; and I do not hesitate to say that such a deed, under the circumstances, conveys a better title than can be got by United States mineral land patent in other parts of Colorado. It need scarcely be added that no lawsuits have yet arisen on the Sangre de Christo grant over the boundaries and nature of mining rights. Two disputes, which would doubtless have developed into promising suits under the United States mining law, were settled by simple reference to the records in the office of the company.

It is to be hoped that the experiment thus inaugurated may result in a productive industry, all the profits of which shall go to miners, teamsters, smelters or millmen and stockholders, without any deduction for lawyers, judges, juries and experts; and it would be pleasant to see the owners of other land grants take courage from this example, and deliver forever from the nuisance of extra-lateral rights the mineral lands which they control.

## Notes on Gold Milling in California.

NUMBER XVI.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

*Transmission Ropes and Belts.*—Six hundred feet best manilla or cotton rope, 1½ inches in diameter, to drive battery line shaft.

Two hundred and fifty feet best manilla rope, 1½ inches in diameter, to drive rock-breaker line shaft.

One hundred and fifty feet best manilla rope, 1 inch in diameter, to drive concentrator line shaft.

Two hundred feet best rubber belting, 16 inches by 5-ply, for batteries.

One hundred and eighty feet best rubber belting, 10 inches by 4-ply, for rock breakers.

Thirty-two feet best rubber belting, 7 inches by 4-ply, for cleanup barrel.

Sixty-five feet best rubber belting, 6 inches by 4-ply, for batea.

Thirty feet best rubber belting, 6 inches by 4-ply, for concentrator shafting.

Four hundred and twenty feet best rubber belting, 3 inches by 4-ply, for concentrators.

Thirty feet best rubber belting, 3 inches by 4-ply, for cleanup pan.

BUILDINGS AND ERECTION OF MILL, ETC.

*Stonework.*—All foundations and retaining walls to be built of large stone, properly banded, and well laid in cement mortar, composed of ten parts good, clear sand, two parts good quality of lime and one part best Portland cement, special care being taken to keep all dirt or clayey material excluded, all exposed faces of retaining walls to be well painted up and finished with the same material.

*Ore Bins.*—Mudsills to be made of 12x14-inch timbers, laid flatwise; foundation posts to be made of 14x14-inch timbers; sills, posts and caps for ore bins proper to be made of 12x12-inch timbers, the posts to be boxed one inch into the sills and caps; braces for incline bottom to be made of 10x12-inch timbers; supporting braces to be made of 8x12-inch timbers. All planking to be three inches thick and lined throughout with one-inch boards to break joints over the planks.

*Battery Frame.*—Mudsills to be made of 14x16-inch sugar pine, or good yellow pine free from sap; to be well bedded in concrete, which must be put on the clean bedrock. Linesills to be made of 12x16 and 20x16-inch sugar pine or yellow pine, of good quality, to be well bolted down to the mudsills.

Mortar-blocks to be made of two pieces each, to be 30 inches thick and wide enough to fill space between the linesills and battery posts; all to be sized and well fitted. The timbers for mortar-blocks are to be accurately fitted together and secured with six 1-inch bolts, and two oak keys, 4 inches wide by 5 inches thick at the point and 6 inches at the head. Keys to be accurately fitted and firmly driven. Blocks to be sized and finished above the floors.

Yokes to be made of 10x10-inch timber, well fitted and bolted to the linesills and battery posts.

*Bulletin No. 6, California State Mining Bureau.

Battery posts to be made of 12x24 and 20x24 inches, good quality pine timber, to be dressed all over, and bolted down to the linesills with 1-inch joint bolts, the large posts to be made with double tennon on the bottom. The knee beams to be made of 12x16-inch timber, dressed all over. The knee posts to be made of 12x16-inch timber, dressed all over. The stringer on top of the knee posts to be made of 12x16-inch timber in two pieces, to be spliced with a ship splice 3 feet long, stringer to be dressed all over. Knee posts to be framed into stringer with double tennons; outside stringer at end of the knee beams to be made of 8x12-inch timber in two pieces, spliced with ship splices in center 3 feet long and to be dressed all over.

Bottom guide girt to be made of 12x16-inch timber, dressed all over, one piece for each twenty-stamp battery, and to extend past the outside posts 12 inches; the top girt to be made of 12x14-inch timber, dressed all over, and made the same length as the lower ones; all braces to be made of 8x12-inch timber, dressed all over, and framed with double tennons; no keys are to be used in braces or guide girts, but they must be accurately fitted without.

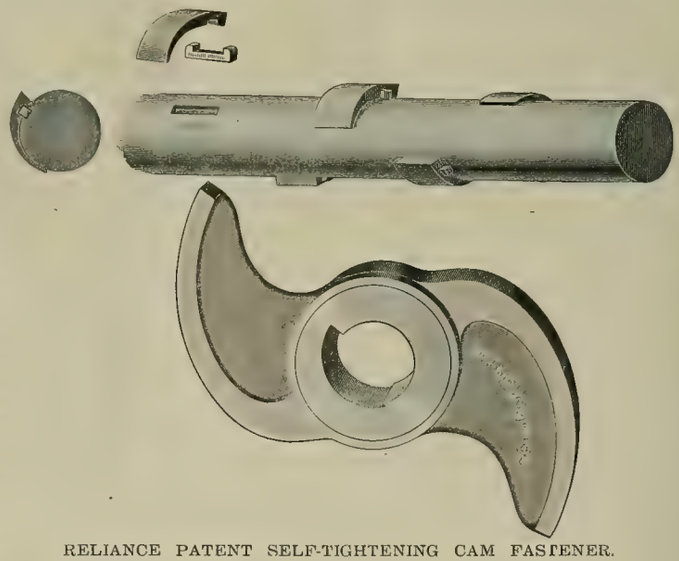
All boxing about battery frame to be ½-inch deep, and where braces or knee beams are smaller than the timbers they frame into, they must be housed in ½-inch deep; *i. e.*, the timber must not be boxed out clear across.

The cam-shaft is to be set 4¾ inches from the center to the center of the stems.

A 2-inch plank floor is to be put on top of the knee beams, which is to be planed on the under side; also, a 2-inch double board floor to be put in back of the battery, on about the same level as the knee beams.

The whole battery frame to be painted with two coats of light-cream paint, properly mixed with oil, and the wood pulleys and guides to be painted blue, the ironwork to be painted black. The out-board bearing frame to be made of 12x16-inch timber, planed all over, well framed and bolted together, and anchored to a solid stone foundation, as shown in plan, and to be painted same as battery frame.

*Frame Work.*—Ore-house main frame is to be made of 8x8-inch timbers throughout, with 3x6-inch girts and studding.



Battery and concentrator rooms frame is to be made of 8x10-inch posts and chords, 6x10-inch sills, 8x8-inch principal rafters and straining beams, 4x8-inch truss braces, and 3x6-inch girts and studding.

Clean-up, sulphuret, and water wheel rooms main frames are to be made of 8x8-inch timbers, with 3x6-inch girts and studding.

*(To be Continued.)*

## The Reliance Patent Self-Tightening Cam Fastener.

Herewith is illustrated the Reliance self-tightening cam fastening, which consists of a wedge curved to fit the circumference of the cam shaft, held in position on the shaft by a double-headed key. The key is to locate the curved wedge in its proper position while the cam is tightening itself. It does not take the place of an ordinary key. The back of the wedge is curved to a true involute which coincides with the curve of the recess in the hub of the cam; and when in position, the strain is distributed equally over the whole surface of the wedge. The recesses in the cam hub are all cut alike, the position of the cam being governed by the position of the wedge on the shaft, therefore cams for renewal can be sent from the shop finished.

RELIANCE PATENT SELF-TIGHTENING CAM FASTENER.

The manufacturers are The Edward P. Allis Company, Milwaukee, Wis. Branch office, 9 Fremont St., San Francisco, Cal.

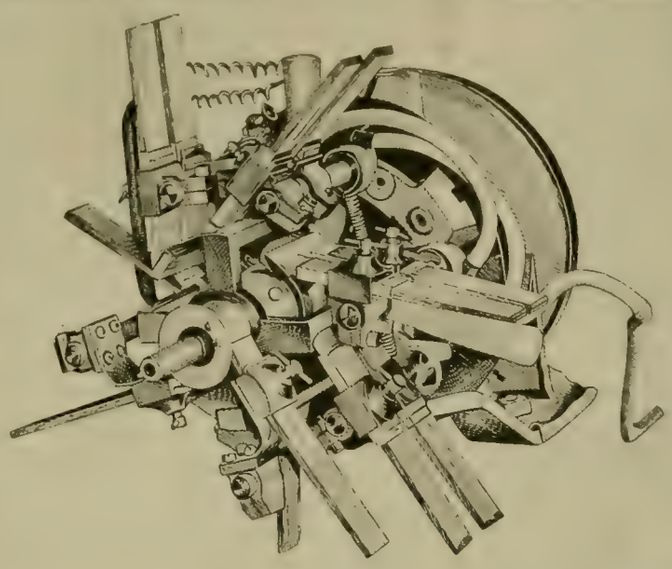
# Electrical Progress.

## A New Electrical Current Rectifier.

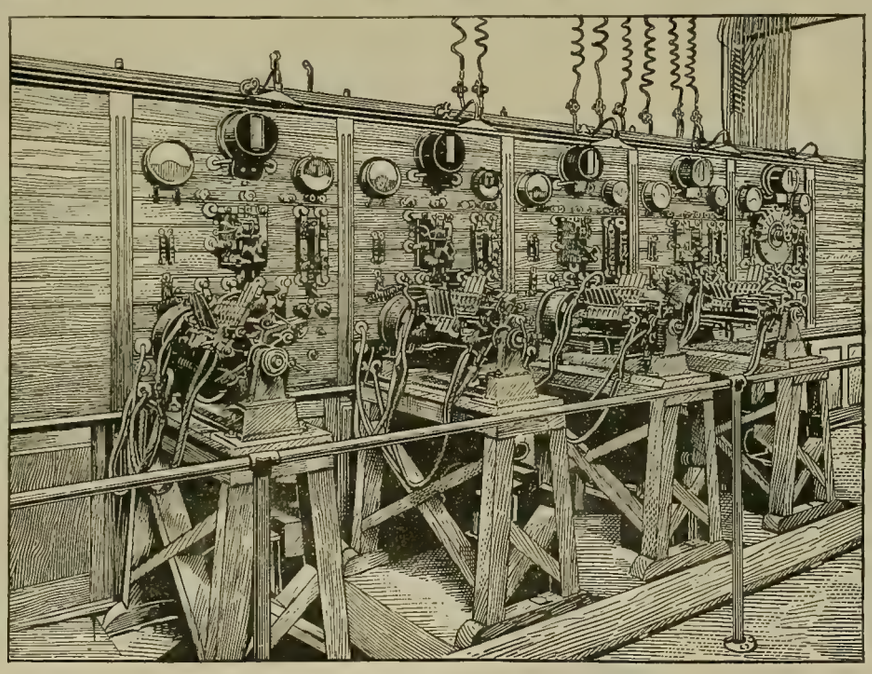
Written by Consul General Frank H. Mason

Extension of incandescent gas lighting, its cheapness and brilliancy, added to the possibility of changing its tint by varying the combination of oxides in the incandescent mantles, have checked the adoption of electric lighting in Germany, and forced electrical companies to seek new outlets for their energy in the directions of motive power and electrolysis. The central electrical system at Frankfort has proven technically successful, but private consumers generally complain of its high cost, and it is already evident that the financial success of the enterprise will depend in future upon the more general adoption of electricity for motive and electro-chemical purposes.

These conditions lend interest to a device known as Gleichrichter, or rectifier, invented by C. Pollak, a Frankfort engineer, which solves the difficulty of converting an alternating into a direct electrical current with a loss of but a trifling percentage of its energy. In nearly all cases where the central generating station is located at any distance exceeding a mile from where the electrical energy is to be finally used, alternating currents are preferred as more available than continuous ones, for the reason that the former can be readily condensed to very high pressures and in that condition transmitted to any reasonable distance, and then reduced to low working potential by stationary transformers. A continuous current, on the contrary, can be reduced only by the use of a working converter, running in synchronism with the central generator—an additional machine which greatly increases the cost of the plant. For this and other reasons, alternating currents are usually produced at modern power stations in Germany, and while equally available for incandescent lighting and for motors which can be run synchronously with the dynamo, they are distinctly inferior for arc lighting, and can not be used at all for electrolysis or charging storage batteries.



The invention herein described bridges, therefore, an industrial difficulty which has become more and more serious with each step of progress in transmitting electrical energy over long distances from the place of generation. Electricity is supplied at Frankfort from the municipal central station at 7¼ pfennings (a little more than 1¾ cents) per unit, in the form of single-phase alternating currents of 3,000 volts. At the accumulator works, where the Pollak system has now been in successful operation for more than a year, this current is reduced by transformers to 65 volts and then rectified—that is, converted into a direct current by the new device, which may be described briefly as follows:



It is well known that every continuous-current generator produces to a greater or less extent alternating-current impulses, but in such machines this tendency is corrected by the commutator, which is fixed directly on the armature shaft and imparts to the entire current a uniform direction. The problem was, therefore, to devise a plan by which a commutator, located at any distance from the dynamo creating alternating currents, and turning synchronously therewith, should have the same effect of turning the entire current in a uniform direction—in other words, converting the alternating currents after they have passed into the outer circuit into a direct one. For this purpose, the present invention employs two collector rings and two rows of commutator bars, the latter insulated from each other and the shaft and alternately connected with the rings. The alternating currents, having been received from the central station and reduced to 65 volts as above stated, enter the machine through brushes resting on the rings. The direct current is taken off by four more rows of brushes arranged adjustably, the first and third and the second and fourth rows being connected with each other.

The rectifier is turned by a sychronous motor of small dimensions, which receives its alternating currents, likewise reduced to 65 volts, from a small special transformer. The outer circuit of the continuous current which passes from the rectifier includes an automatic disconnector, fluid-resistance amperemeter, and, in various parallel shunts, electric motors and cells with their volt meters and other apparatus. The converted current produced by the rectifier is not entirely continuous, but pulsating, the length of the pulsations being governed by the width of the commutator bars and the speed of the central generator. The duration of contact can be regulated by adjustment of the brushes, and this adjustment should be so made that the motive force of the current shall not fall below that of the battery, which would otherwise charge back into the circuit.

Four of these rectifiers, each for 350 amperes, have been in continuous service day and night at the works of the company in Frankfort for more than a year, with such complete success that the system may be fairly claimed to have passed the experimental stage. Their efficiency is stated to be 96 per cent—that is, the alternating currents are converted into direct ones with a net loss—including the slight reaction of about two per cent on the transformer—of only four per cent.

The direct pulsating current thus created is adapted for electrolytical work, it being an established principle that the induced currents resulting from such pulsations greatly promote electrolytical action. It also lights arc and incandescent burners, runs continuous-current motors of all sizes down to the smallest, and is used for charging storage batteries, which is the chief function of the Frankfort company. The rectifier and its accessories are compact, the whole installation, including seven transformers, occupying only 25 square yards of space, within which compass the apparatus and its capacity might easily be doubled should occasion require. The rectifiers are small, require no other foundation than wooden trestles resting on a solid factory floor, and demand no more oversight than an ordinary dynamo. From the testimony of the inventor and the experts who have visited Frankfort especially to examine the system, the current supplied by the new rectifier is for all practical purposes indentical in value and effects with the continuous currents hitherto produced in the ordinary manner.

NEW ELECTRICAL CURRENT RECTIFIER.

---

The Daddy Company, of Murray, Idaho, have their new dynamo at work. It will furnish eighty incandescent lights of 16 candle power each, and will enable them to light the tunnels, tramway, mill, outbuildings and yard. Such things show enterprise and confidence in the country.

## Storage Battery Traction in Sight.

Herbert Lloyd, in a lecture on recent improvements in America and Europe in the storage of electricity, says that the number of storage battery installations being made in England is astonishing. Private house plants, run by gas or gasoline engines, are met with everywhere, and central station batteries are going in as fast as central stations are being built. The English have a high appreciation of American batteries, of which they are purchasing large consignments. Hitherto the running of the storage battery railroad in Birmingham has given varying results. It is now equipped with American batteries and the service is much more satisfactory to the public and profitable to the company. A new element, termed by experts "recuperation," has assumed great importance in storage battery car operation. It is found that a car, while descending a ten per cent grade, can recover fifty-seven per cent of the energy expended in ascending it; on a four per cent grade a return of forty-two per cent is effected, and on a two per cent grade, twenty-three per cent. The new electric line in the Isle of Man, equipped with a trolley system having a battery in the power house, has an almost uniform grade of twelve per cent. The car on this grade delivers back to the battery about thirty-three per cent of the energy it consumes in ascending. This means a considerable economy. Great improvements are being made in the casting and recasting of grids, which reduce both the first cost and the operating cost of the installation. It is well known that in this country patent litigation has long interferred with the progress of the storage battery. Now, the incidental restrictions have in a great measure been removed and the use of the storage battery for traction purposes is rapidly approaching a commercial stage. The question of electric vehicles is attracting the attention of the large carriage and bicycle manufacturers, many of whom are now building such vehicles, and with a battery such as is now produced, capable of very heavy discharges, and with good roads, the business prospect would appear promising. Storage battery plants for train lighting are found most useful, and their use is rapidly extending. The use of electric launches is also growing steadily in this country. The improvement in storage cells for this work is shown in the fact that the batteries on the launches, which ran for three months at the Atlanta exposition, did not cost one cent for repairs, which was not the case at the World's Fair.

## Edison and the Roentgen Rays.

So far, Crookes tubes, which were supposed to be necessary for reaching the best results in the Roentgen experiments, have been quoted at about $50. Edison has been busying himself, and has succeeded in turning an ordinary incandescent lamp bulb into a miniature Crookes tube, which will serve many of the purposes of the investigator. He seals into the narrow end of a sixteen-candle power bulb a wire carrying a disc of aluminum five-eighths of an inch in diameter. To a wire passing into the thick part of the bulb he attaches another aluminum disc, about one and three-eighths inch in diameter, which stands at right angles to the first disc. That is all; the bulb is then ready for experimentation. It costs about 50 cents. The current with which Mr. Edison is con-

ducting many of his experiments is obtained from a two or three-cell storage battery, passed through an induction coil which would give a spark across a gap of about three inches; so that for $10 anyone can purchase a plant by which he may become an original inventor or great discoverer. What Edison has already shown of the permeability of different metals to the cathodic rays, as revealed by the use of the simple apparatus referred to, is of the greatest value and has excited universal attention. There is now no hindrance to the prosecution of similar investigations in hundreds of laboratories where insufficiency of equipment has deterred experimenters from entering this fascinating field, and some remarkable developments are likely to follow. While electricians are immensely interested in the work that is being done with these invisible rays from the negative end, a great many of them are convinced that the final outcome will be a great advance towards the efficient production of the direct light rays of these vacuum tubes; so that our lamps, in the near future, will simply be exhausted glass bulbs without any light-giving material of any description, the light being obtained by the electric vibration set up of the ether or air within them.

### A Point in Central Station Economics.

To what extent a labor-saving device can be made to effect an economy has been very strikingly demonstrated in the case of one of the large electric illuminating companies which recently concluded to fit up each one of its arc light poles with a clock-switching device designed to automatically throw into and out of circuit each of the lights at certain hours of the evening and morning, and thus to supplant the service of the men hitherto employed to make the rounds of the poles and do the same thing by hand. The company had at the time 600 arc lights in use for street illumination. The lights were 400 feet apart, and the city contract specified that they all had to be turned on not later than fifteen minutes beyond a certain hour of the evening, and might be again turned off not earlier than fifteen minutes before a certain other hour in the morning. Experience had shown that a man could walk about 4,000 feet in a fifteen-minute interval, and turn on or off the ten lights within that distance, so that, for the whole 600 lights, the services of sixty men were required, which could not be secured for less than $4 per week per man, entailing thus the expenditure of $240 per week, or $12,480 per year. The clock-switching devices, which did the same work, cost $5.50 apiece, making a total for the 600 poles of only $3,300, which investment, of course, will not be a yearly recurring one. What the saving effected by the automatic switches will be may be left to the reader's own calculation. The whole affords a lesson in central station economics in which station superintendents ought to find something decidedly interesting.—From Cassier's Magazine for March.

WRITING in Cassier's Magazine for March, on "Electric Power Stations," C. J. Field says that an up-to-date station, say one of 5,000 kilowatts capacity would cost as follows: Steam plant, $85 (£17) per K. W., including engines, boilers, pumps, heaters, coddensers, piping, etc.; electric plant, including generators, switchboard, cables, etc., direct-connected units, $30 (£6) per K. W.; power station, building under average building conditions of good foundations and no rock excavation, including foundations, building, stack, etc., $15 (£3) per K. W.; sundries, $10 (£2) per K. W. This makes a total of $140 (£28) K. W. This is exclusive of real estate.

ELECTROLYTICALLY formed seamless copper steam pipes made by an English firm have been carefully tested by the marine department of the Board of Trade and declared to be acceptable for ships built under the Board's survey.

## Scientific Progress.

### Acetylene Gas.

The *Engineering Record* says: "If we compare pure acetylene and carburetted water gas, the former furnishes by far the greater quantity of light for the same money. The especially violent character of the explosions of certain mixtures of acetylene and air will always constitute one of the most serious objections to its use alone. To be sure, these explosive mixtures are sometimes formed with ordinary illuminating gas, but in this case the explosions are not so violent. The danger increases as the quantity of combustible gas necessary to form an explosive mixture decreases. In the case of acetylene only one-half the quanity of gas is necessary to form the most explosive mixture with air that is required if coal gas is used. The most serious objections may be urged against the scheme of reducing the acetylene to the liquid form and distributing it to consumers in cylinders. While such a plan is perfectly feasible, it does not appear that any possible advantages can offset the danger incurred, and a few serious explosions will probably end the matter."

IT appears that the rays of the sun's corona, though differing from Roentgen's X rays, may affect photographic plates through metallic sheets, which screen out the less refrangible radiations of the solar disc. This is reported by David E. Packer of the Astro-Physical station at South Birmingham, England, as a result of many experiments since last July. Advantage has been taken of the discovery in photographing the corona of the uneclipsed sun, screens of tin and lead foil and copper sheets being successfully employed over camera lenses of four-inch and one-inch aperture, and the protographic plates being affected in proportion to the thinness and electrical conductivity of the screen. Prominent equatorial extensions over the region of active sun-spot groups are the chief features of the pictures. But much more remarkable coronal photographs were obtained without any camera lens, through a neat pin-hole aperture, which transmits rays of every degree of refrangibility entirely unaffected. In these interesting and surprising features of sun-spot development are shown.

IT is announced by the French Academy of Sciences that it is possible to photograph through so-called opaque bodies with ordinary light. A kerosene lamp will do it. M. Lebon asserts that he has taken photographs in this manfor several years. He proceeds as follows: "Inside a box, with rather thin sides, he places a sensitized plate. Behind the negative in front of the box he places an iron plate, and on the other side of the plate a lamp. After three hours' exposure an image is found. On development this image is indistinct, but if a sheet of lead be placed behind the box and rolled over to touch the iron plate so as to form a metallic shell, the reproduction of the negative for the same length of exposure is quite distinct. This experiment cannot be accounted for on existing theories." M. Lebon has ascertained that the image is not due to any phospherescent light which might have been stored up in the negative. The experiment will not succeed if heat rays only are used.

THE ethereal medium, in which certain wave motions occur, presents many striking similarities to the behavior of elastic matter, and more especially of that which is gelatinous. Gelatinous substances are always capable of transmitting longitudinal as well as transverse waves. It has, therefore, been inferred that longitudinal waves must exist in the ether, although they had not been discovered, or at least recognized. Roentgen, guided by what appear to be the probabilities of the case, has stated his opinion, with all due reserve, that the rays which he has discovered must be the long-sought longitudinal ether waves. In all elastic bodies, particularly in gelatine, the rate of the propagation of longitudinal waves greatly exceeds that of the propagation of transverse vibrations. Professor Boltzman argues that, if such be the case also in the luminiferous medium, Roentgen rays, although of high frequency, may be of considerable wave length. The high frequency of such waves would accord with their power of exciting fluorescence, which, presumably, should be a maximum when the periodicity of the wave motion approaches most nearly to that of the molecular swing. Professor J. J. Thomson writes, respecting the electric leakage due to the incidence of Roentgen rays: "This differs materially from that investigated by Elster and Geitel and due to ultra-violet light. In the first place, the Roentgen rays discharge positive as well as negative electricity, and, secondly, the leakage goes on even when the electrified plate is embedded in paraffine, ebonite, mica, sulphur, etc. This shows that all substances through which the Roentgen rays are passing become for the time conductors of electricity. The result seems to me very suggestive both as to the nature of the rays and also of the conduction through the insulator."

BY the apparatus of a French chemist, E. Hardy, it is made easy to determine whether the acetylene in the air of a room or the firedamp in a mine is approaching a dangerous proportion. The apparatus is an acoustical one, giving to the ear a very accurate quantitative analysis of mixtures of two gases having different densities. A microphone is attached to each of two sonorous tubes, which an electric current traverses in succession, passing then to a telephone receiver at a little distance away. This receiver repeats distinctly either the pure sound or the beats produced by the sonorous pipes. With air containing 1-1000 of coal gas from two to three beats were obtained in twenty seconds; with 2-1000, about six beats; and with 20-1000 of gas, sixty beats in the same time. Perhaps some genius will now apply the principle to an alarm for promptly notifying the hotel clerk that the occupant of a certain room has blown out the gas.

DR. G. SCHATT, studying the form and height of the waves of the deep sea, found that under a moderate breeze their velocity was 24.6 feet per second, or 16.8 miles per hour, which is about the speed of the modern sailing vessel. As the wind rises, the size and speed of the waves increase. In a strong breeze their length rises to 260 feet and their speed reaches 360 or 364 feet per second. Waves, the period of which is nine seconds, the length 400 or 425 feet, and the speed twenty-eight nautical miles per hour, are produced only in storms. Dr. Schatt does not think that the maximum height of the waves is very great; his maximum is just 32 feet. He believes that in great tempests waves of more than 60 feet are rare, and that even those of 50 feet are exceptional. In the ordinary trade winds the height is 5 or 6 feet.

MANGANIN, which is the alloy of copper, nickel and manganese, has remarkable electrical properties. Its resistance hardly varies at all even through a range of temperature varying from 15° to 97° Centigrade. It thus becomes a superior metal for the construction of artificial resistance.

AMONG the victories of science registered in 1895 may be reckoned as especially important the establishment of anti-toxine as the reliable foe to diphtheria in all the hospitals of the world and in general practice.

IT is said that the wild lettuce is "one of two well-marked compass plants," and that it has the property of twisting its leaves until they point straight upward, with the edges directed north and south.

## Mechanical Progress.

### Gunning With Compressed Air.

A new army rifle has been constructed by Paul Brand of Berlin. It differs in its construction from all other guns in that no provision is made for the the firing of a discharge, since the shooting of the projectile is caused by the sudden expansion of compressed gas. The greatest advantages claimed for the new system are: First, the trifling heat generated in the gun barrel; second, the absolute absence of smoke; and third, the impossibility of the formation of dross in the gun. The cartridges are also entirely differently constructed from the present style; since there is nothing but the projectile itself, there is no danger handling it, and considerable space and weight are saved to the soldier and hunter. The reservoir carried with the gun contains a quantity of compressed gas, sufficient for 2500 discharges. The force of a shot surpasses that of the present repeating army rifle one and one-half times. About fifty shots may be delivered without interruption. The development of heat within the barrel amounts to 0.03, which is equivalent to the heat occcasioned by the friction of the ball alone when forced through the barrel. The new gun has been patented in all countries, and its manufacture in great quantities is now being provided for.

THE longest distance that a shot has been fired is a few yards over fifteen miles, which was the range of Krupp's 130-ton steel gun, firing a shot weighing 2600 pounds. The gun cost $195,000, and each projectile $4750. The 111-ton Armstrong gun has an extreme range of fourteen miles, firing a shot weighing 1800 pounds, and requiring 960 pounds of powder. These guns, however, proved too expensive, being unable to stand firing a hundred times, and their manufacture has practically been abandoned. The twenty-two-ton Armstrong gun hurls a solid shot for a distance of twelve miles, and the discharge of the gun cannot be heard at the place where the ball strikes. From twelve to thirteen miles is the computed range of the most powerful guns now made, and to obtain that range an elevation of nearly 45° is required. Quick-firing guns are more depended upon at the present day than extreme length of range, and in this respect, perhaps, the most wonderful gun is one of the Maxims, which can fire 600 shots a minute, and yet is so light that a soldier can carry it strapped to his back.

IN comparing the four great tunnels of the world there is seen to be a very remarkable decrease in the time and cost of the successive works. The Hoosac tunnel, the oldest of the four, cost $379 a foot; the Mont Cenis, the next in date, cost $356 a foot; the St. Gothard cost $229 a foot, and the Alberg, the latest in date, cost only $154 a foot. This rapid decrease in cost within comparatively few years is a marked indication of the great progress in mechanical methods and improvement in rock excavating and tools. A still more striking result exists in the case of a tunnel through the Cascade mountains, on the line of the Northern Pacific, in the State of Washington. The tunnel, which is 16½ feet wide, 22 feet high, and 8950 feet long, was bored through the mountains in twenty-two months, at a rate of 413 feet a month, and at a cost of the completed tunnel of only $118 a foot.

AN easily fusible metal composition is now being put upon the market by Houser & Co. of Zurich, Switzerland, under the name of "patent metal cement." This metallic cement melts like lead at about 250° C., and can be cast into the most delicate molds; in addition to this, it sticks like glue to all substances, as stone, masonry, metal and wood. It is almost entirely proof against water, acid and oils, so that it appears well suited for repairing leaks in oil tanks and pipe

conduits. This cement possesses a great power of adhesion, because it extends somewhat during cooling off. Another advantage of the new metal is its small specific gravity of but 1.5. For use it is broken up in small pieces and molten in an iron kettle over a moderate fire, until the mass has become thinly liquid. For casting small objects, molds of plaster of Paris, clay or sand can be used.

## Practical Information.

### Largest and Smallest Books.

Prof. Max Muller of Oxford, in a recent lecture has called attention to the largest book in the world, the wonderful "Kuth Daw." It consists of 729 parts in the shape of white marble plates, covered with inscriptions, each plate built over with a temple of brick. It is found near the old priest city of Mandalay, in Burma, and this temple city of more than seven hundred pagodas virtually makes up this monster book, the religious codex of the Buddhists. In accordance with the three parts of which it is composed, generally called in a figurative sense "baskets" (pitaka), the whole is often termed "the three baskets" (tripitaka), and constitutes a library larger than the Bible and the Koran together. As the Jews figured out that the Old Testament contained 59,493 words and 2,728,100 letters, so the Buddhist priests have computed that the "Tripitaka" contains 275,250 stanzas and 8,808,000 syllables. This monster book is written in Pali. Rather strange to say, it is not an ancient production, but its preparation was prompted by the Buddhistic piety of this century. It was erected in 1857 by the command of Mindomin, the second of the last kings of Burma. As the influence of the tropical climate has already marred the inscriptions, a British official, Mr. Ferrars, proposes to have these 729 plates carefully photographed, and asked that the Government, or some friend of science able to do so, make provisions for this. Professor Muller urges that this be done in order to preserve at least the pictures of this unique temple-city book.

A noteworthy contrast is furnished by a recent German literary journal describing what is probably the smallest book in the world This is a "Konversationslegicon," published in Berlin, and prepared by Daniel Sanders. The volume occupies the space of only six cubic centimeters (.366 cubic inch), although it is claimed to contain 175,000 words. The book must be read through a microscope especially prepared for it.

### Women's Pursuits in Japan.

A recent report on labor in Japan shows that women are employed in a greater variety of work than in almost any other country in the world. Not only do they engage in common agriculture, like many European peasants, but it is by their labor chiefly that the tea and silk of the island empire are raised. In all of the mechanical arts woman has there an active share. The choicest pottery and most elaborate decorative lacquer work come from her hands. She weaves mats and other articles of straw, braids baskets of bamboo, and manufactures countless other articles of the latter material. She goes out in the fishing boats with her husband, and aids in salting and drying the catch. She engages in cabinet work, house building and various other industries in which women in America do not participate. She works almost as rapidly as a man, but receives scarcely more than half the pay. Japanese women are frequently employed in mercantile establishments (as in the United States) as bookkeepers and cashiers, and some of them actually manage large concerns of this class. Nothing is said in the report from which these facts are taken about the professions.

For much of the labor here referred to the average wages (for men and women) is from $1 to $5 a month. Domestic servants get from $2.40 to $7.20 a month. In the city of Yokohama, where the best pay is given, artisans receive on an average between 10 and 72 cents a day, the last-mentioned figure representing the earnings of superior decorators of porcelain. Weavers receive from 10 to 15 cents a day, and silk spinners about 17. In many of the tea shipping houses a large number of skilled persons—men, women and children—are employed from 5 A. M. to 6 P. M., with twenty minutes or half an hour for refreshments at 8, 12 and 3 o'clock. Their pay ranges from 6½ cents a day to 21 cents, and they board themselves. It is said that there is not a single almshouse or street beggar in Japan.

### Wiring the Sahara.

The telephone and the telegraph are rapidly making inroads into the arid portion of the Desert of Sahara. Engineer Bayolle is now on the way from Biskra to Tuggurth with a working force of 100 men for the purpose of laying telegraph wires between the two places. The line is erected as the party proceeds, and the first news from Bayolle was received at Biskra when he telephoned from a point some twenty miles south of Biskra. He advanced at the rate of from three to five miles a day, and will probably reach Tuggurth about the first of the year.

He reports over the 'phone that he has met with a peculiar difficulty; the camels which he has taken along are not used to carrying burdens of a long shape like telegraph poles, and in many cases they refuse to go on with their loads. Each camel was loaded with four poles, two being strapped at each side, the smaller ends dragging on the ground. Bayolle found it necessary to leave half of his poles at stated points, and continue on the trip with the lightened burden; since only short distances are covered at a time, he then sends the camel drivers back for the rest of the load, and in this way the poles are transported without being dragged on the ground. Since the camels will not carry the poles when strapped alongside of them, he had to resort to the peculiar mode of balancing the telegraph poles across the pack saddles, and fastening them in this position by means of straps and ropes. From a little distance it is quite a curious sight to behold the file of camels with their swinging gait and a load extending many feet to each side. One would think that a drove of gigantic birds with spread wings were sailing over the desert.

611 and 613 FRONT ST., San Francisco, Cal.

# Mining Summary.

## CALIFORNIA.

### Amador.

*Record:* The Wheeler and Chandler gravel claims, bonded by Wait and Keeney, have been disposed of conditionally by the bonders to C. W. Haskins, who has begun to work on the claims. A line of pipe 4100 feet long and of 16 inches diameter has been ordered from below. Three hundred inches of water from the McLaughlin ditch will be used working the property. The tailings will flow into Sutter creek, and a restraining dam will be constructed to hold the heavy material. The bond calls for an immediate installment of $5000 on the purchase price of the Wheeler claim, and $1000 on the Chandler property in April.

The mill has started up at the Gover mine. They are now running on rock of a higher grade than before, taken from the 900 level. Two new boilers are being placed in position.

One hundred feet of 11-inch pipe has been laid to operate the gravel claim at Aqueduct.

Some more surveying was done this week in the underground works of the Kennedy mine for the Argonaut company; also, samples of ore were taken from the ground claimed by the Argonaut, and recently worked by the Kennedy company.

The Amador Queen is yet at a standstill. J. F. Parks inspected the works, and has reported in favor of sinking the shaft 500 feet deeper. It is expected the company will soon authorize this work.

The Kennedy chlorination works, which have been idle for several months, started up this week. There is a four months' supply of sulphurets on hand.

### Butte.

The Mascot mine and mill has reopened, M. Coney foreman. The ore runs $5 to $30 a ton.

At the Golden Butterfly the air shaft is completed.

At the Princess two steam pumps are being put in.

### Calaveras.

*Echo:* Work is progressing at the Pure Quill mine; the ore in the drift on the 100-foot level is rich. Judge Cross has arranged to take possession of the mine and open it up in satisfactory shape, and if discoveries prove the property to be one of value, then he is to purchase the same and work it on a large scale.

### Del Norte.

Crescent City *News*: The Craig's Mining Company have commenced work developing their mine on the south side of Craig's Creek, near French Hill. The last steamer brought one hydraulic giant and a lot of pipe for the company.

### El Dorado.

(Special Correspondence)—Judge Morrison of Los Angeles has secured an option on the old Esperanza mine near Garden Valley and will begin next week to pump the shaft with a view to operating the property on a large scale.

S. F. Woodworth made a short run with his new ten-stamp mill, in the Kelsey district, milling 381 tons of ore taken from the grass roots to a depth of forty feet. Though of a low-grade quality, the returns are quite satisfactory. He has a ledge eight feet wide with a nine-foot porphyry gouge on the foot-wall which also prospects well.

The new two-stamp mill recently started by C. F. Bryant is grinding out ore netting $12 in free gold. The ore is taken promiscuously from three parallel veins. Two shafts at a depth of 50 feet and one of 108 feet and a tunnel 200 feet show large ore bodies both on the east and west sides of the diorite.

At the Wykel mine they are ground-sluicing to uncover the vein. The work thus far done yields a good product and is showing a fine ore body. This is near Mud Springs.

The new shaft on the Dark Canyon property has reached a depth of ninety feet. The remaining thirty feet under contract will be completed in a few days. This is situated in the Kelsey district about five miles north of Placerville. It is under bond to a San Francisco party.

Pumping machinery on the Big Sandy will soon be ready for operation. The old Sandy will make a record when started.

Placerville, March 3, '96.

### Inyo.

The Confidence Mining Company of southern Inyo has started up its mill in Death Valley, eighteen miles north of Saratoga Springs. The company has about twenty-five men employed.

The Sterling Mining Company at Montgomery has suspended issuing checks, and lately several checks which were sent out to be cashed have been returned protested, but all are assured that payment will be made in thirty days.

At the Hirsh mine twenty men are employed. Three hundred buckets of ore are handled every day, the buckets of the tramway holding about forty-five pounds each.

The Owens River and Big Pine Canal Company has levied an assessment of 20 cents per share, delinquent April 4th.

### Mariposa.

AT THE SWEETWATER.—*Gazette:* This mine is thirteen miles northeast of Mariposa. W. J. Quick employs seven men running a tunnel at present in 394 feet.

Ludwig's mill has been sold to Macfarlane and Duncan of Sugar Pine Gap, two miles above Hazel Green and thirty-five miles from Coulterville, which will be taken to pieces and moved to its new location.

Three new mines of excellent promise have been opened up at Mt. Ophir, and a new mill to work ores from the Grant will shortly be erected there.

A sale of mining claims in the neighborhood of the Francis mine in Cathey's valley has been made by Moise & Bisland to C. G. Barnd of Fostoria, Ohio.

At the Santa Rosa the mill has been temporarily shut down.

THE HORSESHOE MINE.—This mine is shut down pending partnership arrangements that have taken the form of incorporation under the name of the Horseshoe Consolidated Mining Company, San Francisco. Directors—N. T. Messer, H. Zadig, O. F. Griffin Jr., J. W. Twiggs, E. L. Parker; capital stock, $1,000,000. Some new machinery is to be sent up from San Francisco at once.

The twenty-stamp mill at the Tendron (Whitlock district) is running steadily, and development work in the mine is keeping pace with it. About 80 men are employed, and the pay-roll is in the neighborhood of $4,500 a month.

PERSIA MINE.—There has been a slight accident to the machinery of the Persia which has caused the mill to be stopped for a few days. The owners of the Persia are W. H. Wright, Chas. Benton and Oswald Pertsch. The co-partnery will probably be incorporated as the "Persia Company." Chas. Benton will have charge of the work at the mine, and Mr. Wright will go to San Francisco.

THE TYRO MINE.—The ten-stamp mill on this property is now running again, and thirty men are employed. The property is situated one mile from Coulterville, and is owned by the San Francisco Mining Company. Capital, $100,000.

### Mono.

The State Mining Bureau has received six specimens of marble from the Walker River Marble Quarries. H. S. Durden says it is surface stone, giving promise of improvement when the quarry was worked.

In the Bodie Consolidated the east crosscut from the north drift on the 200-foot level shows porphyry. The north drift on this level has four feet of low-grade quartz in the face. The south drift, same level, is following a small seam of low-grade quartz. The face of the east crosscut from the upraise sixty feet above the 300-foot level is in hard porphyry. The south drift from the east crosscut on the 300-foot level is also in porphyry. The upraise from the fourth incline on the red ledge is in low-grade quartz.

In the Mono mine the east crosscut from the south drift, 400-foot level, was extended seven feet. The face is in hard porphyry.

### Nevada.

*Transcript:* At the old Pittsburg mine excellent rock is taken out. About fifty loads will pay in the neighborhood of $25 per ton. The work is being done on the 500 foot level. Recently the plates at the Pittsburg mine were cleaned up by a thief who evidently understands his business. He scraped them very thoroughly and carried away over $200 in amalgam.

*Herald:* W. M. Mather has fourteen men at work at the Plumbago mine, with John Bovey, foreman, in charge. Two tunnels are being run for the ore chute, and a third may be started this spring. The first tunnel is now in 1300 feet.

### Placer.

Harold Power tells a Colfax newspaper man he intends to push right ahead at the Haskell gravel mine and go clear through the hill, if necessary. At Bath, the Paragon mine has laid off all the men but six. They expect to resume soon with a full force.

The Auburn *Herald* hears that C. F. Reed has sold his Drummond quartz mine above Forest Hill to Denver men for $100,000.

Colfax *Sentinel:* A. B. Eastwood, superintendent of the Hathaway quartz mine at Ophir, has leased the Dardanelles drift mine below Forest Hill, and has men repairing the ditch. At Bath, at the Washington quartz mine, owned by J. B. Sellier, the tunnel will tap the ledge 200 feet from the surface. It is now in 600 feet. The Sellier Consolidated will be developed. This mine embraces holdings of 1000 acers southwest of the Hidden Treasure. Men are getting out timbers.

### Plumas.

*National-Bulletin:* At Thistle shaft 110 men are now employed. A large amount of gravel is being hoisted and washed. The channel is of immense width, estimated by some from 800 to 1000 feet, and evidently is yielding good pay. This mine is disbursing large sums of money for labor and supplies, thus making good times at Gibsonville and La Porte. Even with the large force of miners at work, it will take many years to exhaust this productive mine.

Most of the sluice mines are operating, and such of the hydraulic mines as have permits are preparing to begin work.

### Riverside.

A. H. Naftzger has been removed as receiver for the Good Hope Company. The property has reverted back to the company and E. H. Wilson is reinstated as general manager. The late superintendent, I. E. Boicourt, has paid off all the men, discharged them and work will be suspended temporarily.

The Pinacate mining district, near Perris, is attracting considerable attention.

The Golden Chariot mine, south of the Santa Rosa, and on the same vein, has completed a steam hoisting plant.

The Ophir mine, to the south of the Good Hope, has been developed by a shaft about eighty feet deep.

The Briggs mine at Leon, south of Perris twelve miles, will soon be equipped with a ten-stamp mill.

### Shasta.

*Free Press:* H. Westlake was down from French gulch Thursday with three tons of ore from the Niagara mine, shipped by McCurry to Selby & Co. This makes eight tons sent down this week, five being sent down Monday by Dave McQueen. This ore is valued at $200 per ton. The Niagara mill will start up next month. Mr. Westlake says that John Syme will soon start the Washington mill. A batch of ore from the Washington has been sent to Keswick for trial.

FRENCH GULCH.—*Searchlight:* Mr. Brightman, receiver of the Gladstone Mining Company, is gone to San Francisco. A small force is working at the Gladstone mine.

The Ellery mine continues to be prosperous, and yields fine returns.

The Washington mine is idle, except that several men have a lease on a small portion of it. A number of miners would gladly take leases there if they could get them.

The Harney Bros. have struck an eight-foot ledge of paying ore in their lease of the Scorpion.

The Niagara mill has closed down for a short time. It is expected that a new force will be put to work in the mine before long. Several of the lessees are doing well there, and the company has several good ledges in plain view.

The Brown Bear holds on its usual steady course of prosperity, running constantly, day and night without ceasing, just as it has been doing for the past seven years.

Mr. Jackson has a property near Kennet resembling on the surface the Iron Mountain mine; the ore is rich in copper, and the ledge well defined.

The Baer & Simons gravel mine, near Muletown, is now ready for a thorough test; if the result is up to expectations arrangements will be concluded to bring water eleven miles sufficient to work all the year.

Jas. Ragan is mining with his big giant on the Bally ranch, in Watson gulch, with good success.

The Ancient Channel Drift Gravel Mining Co. has finished the flume and ditch on its Dog creek property, near Delta.

### Sierra.

*Enterprise:* Ten men are working at the Union gravel claim at Gibsonville.

W. A. McNaughten, who represents the Primrose Company, Hog canyon, upon his return from North Carolina will start work there.

Supt. Hansborough, of the Rising Sun and Early Dawn placer mine, Sierra City, says the incline is down 170 feet, and the gravel looks well at the bottom. The bedrock is still pitching. There is an abundance of water power to run pump and hoist, and a ditch over a thousand feet long has been brought in from Reis ravine, which furnishes 80 to 100 inches of water for washing gravel.

### Siskiyou.

MINING NOTES.—*Journal:* The Espey, Hunter & Co. pumping plant and mine will be conducted in the future by J. Quinne, proprietor of the electric light works at Shasta river.

D. McCook crushed six tons of ore from his ledge on Humbug, in the McCook mill, from which he realized over $30 a ton.

The miners along the Klamath have all been working lately, having received a plentiful supply of water from the storms of a few weeks back. The present storm will also serve to prolong their supply of water. Supt. Brokaw, of the Steamboat mine on McAdams creek is expected here from the State of Washington in a short time and will prepare to resume work on the old Steamboat. This mine will be worked on an extensive scale.

*Journal:* The Eastlick mine at Oro Fino was started up last Wednesday morning, sixteen men running two giants. Work on this mine will probably not be interrupted now for the remainder of the season unless a cold snap should come and freeze the water in the high mountains. It takes between 4000 and 5000 inches of water to operate this mine.

All the mines in the Oro Fino district are in operation now.

The Espey, Hunter & Co. mine at Shasta river is now constantly worked.

### Trinity.

AT MINERSVILLE MINES.—The Minersville Hydraulic Gold Mining Company are fitting up for a good spring and summer's run. The main ditch from the east fork of Stuart's fork is being extended three miles. Forty men are employed. The ditch will be ready for water by April 1. Whenever necessary, flumes and pipes are put in as the ditch is extended, so that as soon as dug it will be ready for use. It will carry 4000 inches of water. When completed the mine will be opened up in three places. A large reservoir will be built and an electric light put in. The company now own 3500 acres of auriferous gravel. On the mine are 4000 feet of pipe and three large giants; 300,000 feet of cut lumber is piled up ready for use, and the sawmill near by is able to furnish all lumber needed at short notice. The boarding houses and other buildings are substantial and permanent structures. The mine was operated last season with good results. Since the season closed over $2500 has been expended in prospecting the gravel. H. B. Gordon is superintendent; F. Beaudry, of Weaverville, and E. Saladin, of Junction City, resident managers.

AT COPPER CITY—*Journal:* Messrs. White and Armstrong, at Town creek, Copper City, are working four men on their placer claim, and taking out ten dollars a day to the man. James Salee is working six men at Bully Hill. He is trying to get an upraise open from the end of the old 800-foot tunnel to connect with the old upper workings. The Poyejoys, Kells and Binc are all working ground claims. A hill one mile east of Bully hill is having considerable exploration work done on it by Jennings & Co. A large body of low-grade baryta ore carrying a little copper, gold and silver, has been uncovered.

### Tuolumne.

*Independent:* The App mine is developing at a rate which, if it continues, will make it a second Rawhide. Mention was made in these columns last week of a rich strike in the 400 level, the character of the ore interesting mining men of all classes, on account of the peculiar form in which the gold grows in the quartz. A strike like this in Johannesburg or West Australia would be re-echoed all over the world within reach of a press correspondent. But we are a modest set in California, and in the matter of mines invariably show a disposition to keep the light hidden under a bushel. The truth will, however, prevail in time, as it always does.

## NEVADA.

### STOREY COUNTY.

ON THE COMSTOCK.—Seven bars of bullion, valued at $24,735, have been received from the Con. Cal. & Va., being the production of the last run of the mill. The bullion statement of the mine for February is as follows: Worked at Morgan mill, 1169 tons 1630 pounds of ore; bullion produced, gold, $10,690.90; silver, $14,044.56; total, $24,735.46; yield in bullion per ton, gold, $9.13; silver, $12; total, $21.14; assay value of the ore per ton per battery samples, gold, $11.87; silver, $15.30; total, $27.17; assay value of the above ore per ton per railroad car samples, $34.54.

A telegram from Superintendent Kinkead of the Occidental says the engine and compressor were started up.

CROWN POINT.—The southwest drift on the 600-foot level is now out a total distance of 282 feet. The face continues in heavy ground, composed of clay and porphyry with bunches of quartz through it of about the same character as last reported. The south drift from No. 1 crosscut on the 700-foot level has been cleaned out and retimbered 21 feet; total length, 87 feet. They have reopened and repaired the east drift on the 800-foot level 33 feet. The raise from the 1100-foot level east crosscut is up 67 feet on the slope, having been raised 11 feet for the week. The top continues in low grade quartz. The usual repairs in the shaft are under way.

CHALLENGE.—The joint Confidence and Challenge and Imperial west crosscut from the surface tunnel is out 443 feet, having been advanced 8 feet; the face shows porphyry.

BELCHER.—There have been hoisted during the week and stored in the ore house at the mine, 28 mine carloads of ore, the average top car sample of which shows an assay value of $27.35 per ton.

OVERMAN.—Extracted from north drift, 900-foot level, 36 tons and 1700 pounds of ore. Value of same as per car sample asaay, $50.43 per ton. On the 1100-foot level of the Caledonia have extended southwest drift 35 feet, through porphyry seams of clay and quartz. The quartz is of low value. Have cut water in this drift and have timbered the same. Total length of the drift past east crosscut No. 1, 48 feet.

### LINCOLN COUNTY.

In its report of mines and prospects of Ferguson district the De Lamar *Lode* says that grading for the April Fool mill, under the direction of Robert Francis, is being pushed. The mill is to be a ten-stamp, with a capacity for twenty, and copper plates combined, with a cyanide leaching plant.

Work on the De Lamar Company's new pipe line over the Flagstaff hill is being pushed ahead and much of the pipe is already on the ground. From the present appearance of things the town will not suffer for want of water the coming summer.

The creditors of the Keystone Mining Company, the company itself and all parties interested have joined hands and agreed to lease the property of the Lincoln Consolidated Mining company of Denver. As a consideration the lessee contracts to pay off all the indebtedness, amounting to something like $70,000, and to provide the plant with a new mill, capable of handling 100 tons a day, of which the mine is to be made productive. A pumping plant is also to be put in, that the water which is now being used at the present mill may be forced a distance of six miles to the site selected for the new one. The new mill and other improvements will involve an expenditure of about $100,000.

### STATE LINE MINING DISTRICT.

The DeLamar *Lode* says encouraging reports are heard from the newly organized State Line mining district. A townsite has been surveyed and christened Bonanza. It is believed that before the expiration of the present leases the new district will show the foundation of a permanent mining camp established on the western border of the State of Utah.

### WHITE PINE COUNTY.

In Robinson district Watson and Lawson are running an incline in the Racine mine. The vein is a boneycomb quartz, is over four feet wide and averages $20 in gold. The ore is free.

### LYON COUNTY.

*Times:* The Pecks will work the Douglass tailings in the Douglass mill at this place this summer; work will begin soon to put the mill and railroad shops in shape to begin operations.

MASON VALLEY MINES.—*Times:* The gold mines in the Spragg and Martin district in Mason valley are looking better than ever, and there is considerable ore on the dumps. Some of the mines are waiting for the new mill to start up. The ditch to bring water to the mill for power was completed this week, and it will be but a short time now before the mill will be pounding out gold.

### ESMERALDA COUNTY.

W. J. Sutherland, president of the Holmes mine, Candelaria, reports the work about finished for working the tailings at the Belleville.

## OREGON.

The Rogue River Mining and Water Co., composed of residents of this city, has located as a water right one hundred thousand inches, to be taken out of Rogue river, conducted through flumes to Galice creek, Josephine county. J. W. Northrup is president of the company, W. F. Hyde secretary and American Banking Co. treasurer, all of San Francisco. It is thought they will build the ditch which Jas. Braden has been securing the right of

way for in Gold Hill and Willow Springs precinct, for which a preliminary survey has already been run.

JACKSON COUNTY.

Ashland *Tidings*: F. O. Chezum of Tacoma has purchased the Boggs mining property.

Yesterday morning one of the men working at the Lone mine cleaned up the snug sum of $310 from five pans of dirt.

The continued dry weather is disappointing to the placer miners, but they are living in hopes that March will bring a better water supply.

Another run of sixteen tons of ore from B. F. Warner's mine, just west of Ashland, has been completed at the Hicks & Co.'s quartz mill this week, yielding $10 per ton.

The Hayes Placer mine in Gold Hill district now owned by J. H. Beeman, is being operated this season. The bank averages sixteen feet in height and pays well. A three foot flume of good grade carries the tailings to the river, and a tramway with a dump car is used to remove the large boulders. On the hill 200 feet above, is an ingeniously arranged reservoir, in which at regular intervals the water rises high enough to overflow into a small tank, the weight of which lifts the gate and allows the whole body of water to rush down the gulch, thus washing the ground in its path.

BAKER COUNTY.

A. Geiser, manager of the Bonanza mine, has a $3000 brick, the result of twenty-one days' work. The expense of producing this was a little over $1100. A new body of ore has been uncovered while crosscutting in the lower level.

WASHINGTON.

At Monte Cristo snowslides have greatly interfered with mining operations for the past few weeks, and the damage done by the two big slides of last week has not yet been fully repaired. As a consequence work cannot be resumed in the Mystery mine until some new machinery arrives from San Francisco, and a number of men are out of work. A greater portion of these are spending their enforced holiday in the various Sound cities. A number of unoccupied cabins in the lower part of town were demolished by a big slide which came down over the Sauk lode. The concentrator has also been closed since the slides. At the time it was operating on Golden Chord ore, but the Golden Chord run of 500 tons has been nearly all concentrated, and the present output of the Pride of the Mountain is not sufficient to keep the big concentrator running. The work of repairing the Mystery tram is progressing rapidly under Mr. Bass, and if good weather continues it will be ready in a short time for the bull wheel.

BRITISH COLUMBIA.

The smelter at Pilot Bay began treating ore one year ago. To December 30th, 3220 tons of bullion were sent to Aurora, Illinois, for refining. During 1895 the smelter company transported 52,000 tons of ore and lime rock from the Blue Bell mine, and purchased 2500 tons of ore, of the value of $156,464, from outside mines. Since July 10th, 1894, the company has expended in cash for machinery, labor and the purchase of ores something over $650,000. During 1895 the company employed over 200 men, and paid out for labor $170,000. It also paid out during the same time over $85,000 for supplies, $70,000 for duties, and $92,500 for freights.

Two carloads of hydraulic pipe are at Ashcroft for Cariboo. One carload of 38,000 pounds was for the Ward Horsefly Hydraulic Gold Mining Company, on the Horsefly river. Twenty kegs of rivets also accompany the pipe. The rivets go north to rivet the Ward pipe. The other carload of pipe, 20,000 pounds, is for Hobson's Cariboo mine on Quesnelle river, and is to be used in extending the system of pipes and connections in that mine.

G. Lange has organized a company with $10,000 capital to carry on mining on Dragon creek, where at one time three ounces to the set of timbers was taken out by drifting. When water is brought in Mr. Lange expects to wash 2500 yards per day.

The Victoria Hydraulic Company will operate their ground on a large scale this year.

Large pieces of float cinnabar ore have been found on the west bank of the Fraser river, opposite Big Bar.

Supt. Helgerson has organized, with a capitalization of $10,000, the Elk Mining Company, which has taken a lease held by him on Goose creek, a stream emptying into Cariboo lake, opposite Keithly creek.

ALASKA.

The Nowell Gold Mining Company are putting out an issue of $500,000 in bonds through the International Trust Company of Boston, the bonds being secured by a mortgage to the above amount on their Basin property. Of the amount, $300,000 will be used in retiring previously issued bonds of like amount on the same property, the balance of the half million to be spent in acquiring other mining property, as stated in a mortgage filed for record at Juneau. They are of $1000 denomination, bear seven per cent interest, and run from 1901 to 1914.

UTAH.

PARK CITY.—On the 29th ult. the Ontario mill shipped 53 bars base bullion. This brings the total shipment for the month up to 172 bars. It is understood that each bar will average 475 ounces of pure silver. The Ontario mine paid a ten-cent dividend that day.

The Silver King will pay its regular monthly dividend of $37,500 on Saturday, March 7th.

The board of directors of the Dalton and Lark Mining Company at its meeting on the 29th, declared a dividend of half a cent a share, a total of $12,000, payable on March 15th. It is but ten days ago that the organization of the company was effected, but it was with ores in sight, the value of which Prof. Palmer estimated at $1,500,000. The dividend, said Treasurer Bacon, will be repeated monthly.

IDAHO.

AT MULLAN.—The Hunter mine is running with about eighty men.

The Morning mine is in operation with 105 men employed by Larsen & Greenough.

IN THE COEUR D'ALENES. *Mines*: Ore was struck on the 400-foot level of the Gem mine last week, and the mill has resumed operations again. Seventy five men are employed in the mine. The improvements at the Standard mill are about completed and it is expected to start up about March 1st. The force at the Standard mine will not be increased for a while yet, as the ore bins both at the mine and mill are full of ore.

The Silver City *Idahonian* says: The past week has seen more money "turned loose" in Silver City than in any like period at this season of the year for some time. Last Saturday the Black Jack, Poorman and Boonville had their regular monthly pay day of about $10,000. On the same day the Black Jack purchased the Phillips & Sullivan group for $25,000, most of which went into general circulation. On Monday the Morning Star dispensed $4500, and to-morrow the Trade Dollar will throw about $8000 into the hands of its employes. Something like $47,500 inside of eight days is no slouch.

TIGER AND POORMAN.—The Tiger-Poorman mines in the Coeur d'Alenes are in excellent condition. Sinking is going on in both mines, but the ore is being handled in the Tiger mill. The Poorman mill is being overhauled and will be put in good condition.

*Idahonian*: Supt. Hutchinson, who recently returned from a visit to the Trade Dollar Company's home office at Pittsburg, Pa., says that it has been decided by the management to put in an electric plant at the mill in the spring for power at the mine and for illumination. It has been deemed advisable to extend the development work on the Trade Dollar group to greater depth, and to do so it is necessary to sink from the adit level. Complete arrangements are not yet made as to details. Sinking is expected to commence as soon as the new upraise to No. 3 is finished a distance of but sixty or seventy feet.

IDAHO'S PLACER MINES.—The placer mines of Idaho county produced $75,000 in '95, taken from small properties, only a few men employed, scattered over a large area. There was not last year a single company working in the county employing more than a dozen men, and no company working with a large supply of water hauling more than 1000 cubic yards per day.

Last season several companies installed plants of large capacity on various properties throughout the districts, and although there will be but few men more employed in active mining work, a vast amount more of gravel will be handled by the large hydraulic plants, steam excavators, etc. The Warren Placer Mining Company put a large steam shovel on the Warren meadows last season and a successful run was made toward the close of the season. The plant weighs on the track 100 tons. Its capacity is 1500 cubic yards per day. The company own about 100 acres of rich ground.

At Florence a large tract of valuable ground is to be exploited by a New York company and a bedrock flume put in if ground proves satisfactory. This property is the catch basin for all the rich deposits that were sluiced off in the early days.

The same company is working on the Clearwater river, properties for years unworked for want of sufficient capital to open them on a large scale. The plant will have a capacity of 6000 cubic yards per twenty-four hours.

The Victor Mining Company at John Day's creek and the Slate Creek Mining Company at Freedom have ditches and water privileges, and will handle considerable gravel. Active mining will commence in March.

Elk City has a large hydraulic elevator plant, owned by the Idaho Company of Chicago, and another one is being put in by Butte, Mont., people.

MONTANA.

AT COOKE CITY—Fifteen miners employed on the Daisy have uncovered a body of ore 22 feet wide which shows wire gold. The Daisy mine was purchased last fall from its locators for $30,000 by Dr. Lehnan, of St. Paul, representing Mr. Bliss of Saginaw, Mich., a stockholder of the Burlington Railway Company. The mine is developed to a greater extent than any of the other of the hundreds of claims in the New World district.

COLORADO.

The Columbine-Victor Deep Mining and Tunnel Company will install the first electric drilling and lighting plant in Colorado. New tunnel houses have been erected at both ends of the enterprise, the company being engaged in driving through Squaw mountain from both ends simultaneously. The tunnel from the east end is in a distance of 460 feet, and the west end has been driven over 600 feet, the combined work accomplishing about ten feet per diem. The size of the tunnel is 7x8 feet in the clear.

Colorado Springs *Gazette*: The Metallic Extraction Company of Florence has contracts for all the low-grade ore of the Elkton Company for six months. The company is also getting the low-grade dumps of the Raven Company. The reduction plant has now been enlarged to handle 400 tons every twenty-four hours, and will call upon the Cripple Creek mines to furnish it with that amount of low-grade ore every day. The plant has a capacity of roasting 250 tons of ore every day.

A stampede to Yellowstone gulch, ten miles from Lake City, began yesterday because of the discovery of fine specimens of wire gold in the Woodstock mine recently made. The mine is an old location classed as a low-grade copper and silver producer, and was not considered of especial value. Recently the owners have been developing their property by a drift and shaft in the tunnel, and for some time they found pocksts of wire gold quartz which they threw over the dump, thinking the stuff was wire copper. Specimens valued as high as $25 have been taken from the dump.

ORE CONTACT DEPOSITS.—The experience of Colorado mining says, State Geologist T. A. Rickard, has made the prospector familiar with the term "contact," as applied to the occurrence of valuable ores along the line separating two dissimilar rock formations. The bonanzas of silver lead found between the white porphyry quartz felsite and blue lime of Leadville made the Western miner aware of a type of ore deposit new to his experience and radically unlike the conventional fissure systems of the older gold-producing districts.

There is a fashion in mines as in bonnets, in formations as in cloaks, therefore the phenomenal yield of the city above the clouds caused an eager inquiry and an active search for similar limestone contacts. Across the Saguache mountains Aspen was found with rich ore measures incased between shale and magnesian limestone, both members of the carboniferous. And as the prospector wandered farther afield he discovered the successive ore horizons of the remarkable section cut by the Eagle river, explored the lime-quartzite contacts of Ouray and stumbled upon the gold and silver wealth inclosed within the shattered lime and shale of Newman hill, at Rico.

Ore formations of this class have been chiefly found in carboniferous limestone, and the wealth which they have yielded has been principally in silver. Therefore, the fickle miner may, at this day, refuse to give the subject consideration which it would readily have commanded at an earlier date. Nothing, however, is so likely to retard the development of the mineral resources of a region as a prejudice in favor of any particular mode of ore occurrence or narrow ideas concerning the multitudinous ways in which generous Nature has incased her treasures of gold and silver. While Colorado permits of certain generalizations, such, for instance, as that the granite of the front range is gold-bearing, where penetrated by later eruptives (porphyry), or, again, that the carboniferous limestones are the particular habitat of our largest silver deposits, yet, while recognizing these geological environments, we must take heed not to overlook the existence of valuable ores in formations not as yet, perhaps, identified with important mines.

The object of this communication is not to offer any geological generalizations, but simply to point certain features peculiar to the contact deposits which have poured so large a tribute into the coffers of the State. Of this type the mines of Rico, in Dolores county, afford a very instructive example. Instead of masses of rock several hundred feet thick, the formation is there composed of a series of very thinly bedded shales, limestone and sandstones. The contact consists essentially of a zone of crushed rock whose composition is variable in different workings, because of the non-persistence of the beds. That is, the sand and mud originally laid down in the estuaries of the seas of the carboniferous were not distributed over a large area but deposited patchwise as determined by the currents and eddies of incoming streams.

Within this layer of crushed rock there have been found ore bodies of great richness, containing not silver alone, but gold also. When first intercepted by prospecting shafts it was supposed that a flat vein had been discovered, for up to that time only the ore bearing fissures of Newman hill (since rendered famous by the yield of the Enterprise and Rico-Aspen mines), had been uncovered and the new lode was therefore imagined to be a flattened portion of one of the vertical veins. When, in the course of exploration, this became disproved it was thought that a continuous ore measure, resembling the Leadville and Aspen contacts, had been stumbled upon. But further development made it evident, first, that the vertical veins came to an abrupt termination when reaching the contact and that the ore bodies of the latter were in the form of narrow channels whose direction corresponded exactly with the trend of the veins underneath. Later on it was seen that the ore bodies of the contact lay along a plane which underwent distortion and dislocation traceable to the agency of the fault fissures followed by the veins which had been found to be related to them. Thus the connection between the ore on the contact and that in the veins became established, the occurrence of a vein indicated the place where ore was to be searched for upon the contact and the finding of valuable minerals along the latter was proof sufficient of the existence of some tributary vein underneath. The determination of this geological structure became a key unravelling a veritable tangle of perplexing phenomena and served as a pretty illustration of the application of science to the furtherment of industry.

The miners' first idea was that the ore of the contact had "spilled over"—so he phrased it—into the fissures underneath but there is ample evidence to prove the contrary, namely, that the ore-bearing solutions ascended up along the line of the fissures and then, their further upward progress being ended by the termination of the fissures, which had heretofore been their channel of circulation, they spread out along the zone of crushed rock making the contact. The deposition of ore at this horizon was due partly to chemical causes, such as the precipitating agency of the graphitic matter of the shales, and partly to physical conditions, such as the shattered nature of the rock which afforded a waterway along the bedding. To the miner the important fact is the connection established between the ore on the contact and the veins underneath. It is an association always to be kept in mind when working deposits of this class. A similar geological connection has also been observed at the mining camp of Sawpit, in San Miguel county, and in the slate and sandstones of the Potsdam formation in South Dakota. Whether other larger contact deposits have not some, as yet unrecognized, connection with similar feeders underneath them is a matter worthy of diligent inquiry.

The Cripple Creek *Times* says:

The Stanley Bros. are putting up a fine plant of machinery on the Ida B.

The Doctor mine is shipping 140 tons of ore per week that averages $150 to the ton.

The John E. Smith lease on the Jennie Sample is in fine ore and shipping more than ever.

The Ingham is now shipping about 75 tons of ore per month of an average value of $160 per ton.

The Acacia Company has begun hoisting ore from the Burns lode and will make its first shipment this week.

There are three large hoisting plants on the cars at Anaconda, all of which are to be set up on Raven hill the coming week.

The Barney Barnato Company is diligently pushing things on its properties on Grouse mountain. Two shifts are working and the shaft is 47 feet deep, and the vein matter extends the entire width of the shaft.

The Phoenix and Ellen McGregor on Gold hill, near the Irish Mollie, have been purchased by A. B. Twombly and J. T. Grayson, who were in camp a few days ago. Mr. Twombly is a representative of the Vanderbilts.

The Standard Gauge Gold Mining Company yesterday purchased eleven claims on Big Bull mountain, upon which patents have been applied for. Some development work has been done on these properties and assays obtained as high as $66.

A good strike is reported on the Henrietta No. 2, worked by Dr. J. T. Reid, of Colorado Springs, and associates. A four-foot vein of pay ore is exposed in the bottom of a 45-foot shaft. The claim is about a half a mile south and west of the Lincoln mine.

In the Maid of Lawrence tunnel, on the Lawrence townsite, about half a mile south of Victor, in the breast of the tunnel at a distance of 55 feet a 3½-foot of phonolite quartz has been struck which assays $40. This claim is the property of McMahon & Collier, of Pueblo.

Some good results are being obtained by the active work which the Gold Development Company is doing on a number of its properties in this district. On the Pueblo, Gold Queen and Trinidad claims, south of the Washington, near Victor, prospecting is conducted. The May-Be-So on Globe hill is worked under a lease by this company. A contract has just been let to sink the shaft, now 115 feet, another 100 feet.

ARIZONA.

PRESCOTT NOTES.—*Journal-Miner*: There are seventeen men employed in the Po & Hamilton mine, on Big Bug, of which Henry Murphy is superintendent.

Vincent E. Frost, manager of the Leland Stanford Company, has seven men at work in the Leland Stanford and Snipe claims.

J. J. Milliken is building a five-stamp mill on Lynx creek to work the ore from a number of claims owned by him there.

Nogales *Oasis*: An English outfit has taken a bond on the Goddess of Liberty group of mines, below Union Pass, in Mojave county.

F. L. Fleishman, of Cleveland, Ohio, has purchased the Senator mine in Mojave county, and has employed Mr. Comstock as consulting engineer.

Six feet of sulphuret ore has been struck in Wilson & Bradley's Black Oak mine, in Yavapai county, at a depth of 350 feet in a tunnel, which is now in 400 feet.

There is said to be a pay streak in the Last Chance mine, near Prescott, 3½ feet in width, the ore from which ranges in value from $25 to $80 per ton; that one miner can pick down four tons of this ore per day without the use of powder.

As soon as the litigation over the Flores property in Mojave county is settled, the mill will be started up on a gold property in this vicinity.

The Cherrick mine, on Cherrick creek, Yavapai county, is said to give promise of becoming a bonanza.

S. A. Parnall, superintendent of the Old Dominion Copper Mining and Smelting Company, announces that his company is prepared to buy all the copper ores desirable for smelting, which are offered.

Tombstone *Prospector*: The Mohawk group of copper mines is in the south east end of the S. H. mountains, 12 miles north, 20 degrees west from Aztec on the S. P. R. R., and six miles from the Gila river. This group of ten claims was discovered and located by Geo. W. Norton, Chris. Horner, S. M. Franklin and James H. Graham, about one year ago. The development so far shows one of the largest bodies of copper ore discovered for many years. The ledge is 1200 feet wide, taking two claims in width to cover it. The ledge is composed of iron, lime and copper. On these ten claims there is all kinds of copper ore. Red oxide of copper shows the most. The ore also carries some gold and silver.

Mohave *Miner*: From a stope 12 feet in length, and 12 feet high in the Nighthawk mine, Wm Brandon took out $3,000.

An English outfit has taken a bond on the Goddess of Liberty group of mines, below Union Pass, and have agreed to spend $100,000 putting them in shape.

Theo. B. Comstock, of Prescott, and a Mr. Fleischman, of Cleveland, O., have gone out to inspect the Senator mine and mill. Alfred Ver Mehr accompanied them.

It is reported that an immense flow of water has been encountered in one of the mines in Gold Basin, recently purchased by the Scotch syndicate. Already enough is flowing away to supply a 40-stamp mill. This shows that there is an abundant water supply in our mountains if only properly developed.

## Coast Industrial Notes.

—The Pacific Rolling Mills have resumed operations.

—The Gerlach Wave Motor at Capitola is reported to be a practical success.

—The Alaska Packers' Association has declared a dividend of 75 cents, payable March 12th.

—The Biddle Purchasing Co., of Philadelphia, will operate the old Pacific Nail Works at Oakland, Cal.

—The *Tidings* reports that the Clipper Gap powder mills shipped 1000 kegs of powder to Mexico last week.

—The annual meeting of the stockholders of the California Wire Works has been postponed until April 15th.

—The Berkeley, Cal., Electric Light Company are about to issue bonds for $30,000 to buy a new site and build a new plant.

—Oregon is shipping bacon and ham to this city. The Union Meat Co. of Portland sends an average of 20,000 pounds here on every steamer.

—The Redding *Free Press* hears that the Red Cross Lumber Company will build a narrow gauge railroad from a point on the line of the Southern Pacific near Mott to tap the McCloud river belt.

—The Southern Pacific Company has placed an order for fifteen engines, to cost $180,000. Six will be twelve-wheel locomotives, nine will be ten-wheelers, and will be used for passenger and freight trains.

—The Western Packing Co., Portland, Ore., incorporated in '95 to slaughter horses and export horse meat, has quit, owing to shipments from Chicago of diseased horse meat. Several European Governments have closed their ports against the new American delicacy.

—Oil shipments to San Francisco are increasing. Over 22,000 barrels have come from Ventura county within the last month, nearly all of which was brought by the tank steamer Geo. Loomis, which makes the trip in forty hours. The Ventura shipments for February will be 30,000 barrels, most of which goes to the Rodeo refinery.

—The *Transcript* hears that the Nevada County Electric Power Company is negotiating for the purchase of K. Casper's electric light plant in Nevada City, and that the transfer is about to be made. The company is considering the purchase of the electric light and gas plant at Grass Valley, and is talking of buying Nevada City gas works.

—At present Oregon flour is cheaper in Hongkong than in Portland, where merchants are arranging to ship Oregon flour from Hongkong to Australia. The rates of freight from Portland to Hongkong and from there to Australia combined, being less than from Portland to Australia direct, gives them an opportunity to do this with a prospect of profit.

—Olive growing is one of the few industries outside of gold mining that now pays in California. The largest olive grove in the world is now being planted near Fullerton, in Orange county, by Andrew McNally of the firm of Rand & McNally, Chicago. It will consist of 400 acres of 40,000 trees. It is calculated that when the season is over there will be 3,000 acres of land that have been planted to olives. The demand still exceeds the supply.

—The railroad which Russia is building across Siberia has been extended to a point over 3000 miles from St. Petersburg. When Russia has a railroad connecting St. Petersburg with Vladivostock it will take a pronounced and aggressive stand in relation to Chinese matters. In all that it has recently done in the Orient it has had the completion of this railroad in view. When the line is open it will be able to transport troops rapidly from St. Petersburg through Siberia to the Pacific Coast.

—The Northern Pacific steamship Tacoma sailed for the Orient on the 15th. Her sailing date at Hongkong on the return voyage was originally April 7th, but her date will be taken by one of the new Northern Pacific Steamship Company's vessels, which will leave Hongkong the first week in April. The names of the new vessels are the Columbia and Olympia. The owners of the present line found it necessary to build these two new steamships, which, with the Tacoma and Victoria, will make a fleet of four vessels operated regularly.

—The largest store in the United States is approaching completion on Market street, this city, and the 600 workmen expect to finish by April 15th. It fronts 275 feet on Market street, extends south 350 feet to Jessie street, and is eight stories high. It is built of steel, marble, copper and terra cotta, has fifteen electric elevators, nearly 100 miles of electric wire, and will cost, exclusive of the ground, about $1,500,000. A general stock of everything will be kept; there will be all the usual facilities of a city within its walls, and will be a triumph of concentration in business, and a death blow to several individual dealers.

—The Spokane and Columbia Telephone and Telegraph Co. has organized at Spokane, Wash., with $75,000 capital. It proposes to build from Spokane to Trail Creek, B. C. N. R. Stone says 224 miles of line will be built. "Two contracts have been let for a supply of poles to Rossland and Trail Creek, and work will commence when the franchise arrives from the provincial authorities and when the snow permits, at the latest by the middle of May. We will put on a force of men large enough to complete the line from Spokane to Rossland in forty days. Poles will cost us 40 cents apiece and we can get 3,000,000 at that price. At first a No. 9 galvanized steel wire will be strung. Cross arms will be added and a copper metallic circuit put on, consisting of No. 10 copper wire. We will use the steel for way business and the copper circuit for through business."

—Government work on the Cascade locks of the Columbia river, Oregon, was commenced twelve years ago with a small appropriation. A contract was taken by McBean of Chicago. He was unable to complete the contract, and the Government finished the appropriation. The last contract was intended to complete the entire work and was taken by J. G. and I. N. Day of San Francisco for $1,235,000. At that time the Government had about $300,000 available outside of the amount of the contract. The work was to have been completed last March, but owing to high water of two years ago, which did considerable damage, a year's extension was granted. The money is now all expended, but the contractor will endeavor to get another extension. To protect the work already done it will be necessary to have the wall protected by riprapping on the river side of the locks for a distance of from 3500 to 4000 feet. The point of that protection on the plans already made must be in crescent form, built of stones of certain dimensions set in cement. On the up-river side there is yet to be excavated about 100,000 yards, and about 15,000 yards before a boat can pass through. At the lower end of the submarine work, between the blasted rock and gravel, there is yet to be excavated about 5000 yards, all contemplated under the present contract, and no money to do it with. The high water of two years ago did great damage, being at that point seventeen feet higher than ever before known. The upper guards were seven feet lower than the high water, and when they were put in they were thought to be ten feet above any high water. The water to open and close the valves and gates is obtained from the mountain, about 6000 feet distant, and is operated under a 600-foot head. It is brought down through a ten-inch steel-cap welded pipe, the heads of the pipe being reinforced and put together with lead in the same manner as is usual in making connections of cast-iron pipe. Of the concrete work, speaking approximately, there is about 45,000 yards, and the steel and iron in the gates and connections aggregate 1,250,000 pounds. The gates were made in sections and were shipped out in sections, weighing from sixteen to thirty tons, and from 13,000 to 30,000 rivets were used in putting each gate together. The gates have no out-bearing at the points, but move on hinges the same as a door. The weight of the upper guard gate is about 356,000 pounds, and when completed it was so nicely adjusted that four men could easily open and close it. To proceed with a work of such magnitude requires an immense plant, which consists of six locomotives, fifty-five hoisting engines, fifty-five derricks, 2000 overhead travelers capable of handling fifteen tons, one steam shovel, largest size, one large modern steam dredge, two air compressors, an electric light plant operating fifty arc lights, a complete machine shop with all the necessary tools, a blacksmith shop with six forges, ten pumps with capacity ranging from 200 to 10,000 gallons a minute with engines and boilers to drive them, four large sand washers, one largest size rock crusher and a small crusher with a cement roller and three cement mixers and engines to drive the same, one complete sawmill plant with a capacity of 25,000 feet a day. The stone-cutting sheds are 400 feet long. The stone for the work on the locks is quarried on Herman creek, about four miles above the locks. The contractors built a spur from the O. R. & N. to the quarry, and the stone is brought down with their own cars and locomotives. From the head of the locks to the lower end is about 3500 feet. The work at present is in charge of Lieutenant Harry Taylor of the corps of engineers United States army.

## Obituary.

REUBEN RICKARD, a well known mining man of this coast, died at Perth, Western Australia, on the 27th ult., in the fifty-sixth year of his age. He sailed about the middle of last November under engagement from some English capitalists, at a salary of $10,000 per annum, to examine West Australian mining properties. Mr. Rickard was prominently identified with silver-lead interests in Eureka, Nev., for many years, and acquired considerable wealth. Mr. Thos. Rickard of the Parke & Lacy Co. of this city is his eldest son. Mr. T. A. Rickard, State Geologist of Colorado, is his nephew. Mr. Rickard left an honorable memory and his death is a source of sorrow to many.

## Recent Mining Incorporations.

The Last Chance Gold Mining and Milling Company, San Francisco. Directors—A. D. Taylor, D. M. Tomblin, W. R. de Frees, P. W. Johnson and A. L. Jenkins; capital stock, $100,000; all subscribed.

The Mariana Marsicano Gold Mining Company, San Francisco; capital stock, $1,000,000; $500 subscribed. M. O'Brien, H. Hinchmann, P. Marsicano, G. A. Hinkelbien and F. W. La Bonte, of San Francisco, directors.

The Tenabo Mill and Mining Company, San Francisco. Directors, Simeon Wenban, William P. Shaw, W. E. F. Deal, Thomas J. Read and Oscar R. Jones; capital stock, $1,500,000, all of which has been subscribed.

## Commercial Paragraphs.

The Union Gas Engine Company sent five gas engines and hoists to Australia on the Monowai last Friday.

There will be eight Woodbury concentrators shipped to Australia by the next steamer. Mr. Woodbury has just shipped two to Idlewild Mining Company, El Dorado county, and has recently put in six machines for the Carson Creek Mining Company and has sent one to Mexico; another to Boise City, Idaho, and another to Butte, Montana.

## Personal.

J. C. CALLAHAN is inspecting mining properties at Pony, Montana.

S. P. DORSEY of the Maryland mine, Nevada Co., has returned from Louisiana.

SUPT. KEATING of the Savage and Justice mines has returned to the Comstock.

H. G. BLAISDELL, first governor of the State of Nevada is visiting Nevada City, Cal.

THE leave of absence of T. L Ford, who is now in Washington expires on the 18th inst.

SUPT. G. W. Dickie of the Union Iron Works has gone to Japan on business and pleasure.

CLOUD R. WATSON, of Edinburg, Scotland, is making a trip through Utah's mining camps in behalf of Scottish capitalists.

ED SCHIEFFELIN who was the first successfull discover at Tombstone, Arizona, is now interested in placer properties at Woodville, Or.

MESSRS. BIGELOW AND NELSON are understood to be on their way from Boston to inspect the Merced Gold Mining Co.'s properties in Mariposa county.

WALTER S. KELLY, until recently connected with the United States assay office at Helena, Montana, has taken charge of the Elkhorn mine, Elkhorn, Montana.

T. B. COREY, formerly superintendent of mines for the Oregon Improvement Company, has taken charge of the Navy Coal Company's mines at Cumberland, Wash.

CHARLES M. ALLEN, superintendent of the Butte & Boston smelter, has retired from that position to devote his time to other enterprises. It is understood that Rob't White will be his successor.

RECEIVER SMITH of the Atlantic & Pacific has appointed Don. A. Sweet general freight and passenger agent, with headquarters at Albuquerque, New Mexico. At one time Mr. Sweet was general traveling manager for the Santa Fe system.

L. F. J. WRINKLE, who for the past five years has been developing his borax plant at Keeler, has sold it to an English syndicate. His sons, Herbert and Noah, who have been under big salaries as assistant superintendent and foreman respectively, have been retained under the new management.

DR. GEO. C. MUNSON, mining engineer, known throughout the West for the past thirty-five years, is now connected with the General Gold Ore Extraction Co., Ltd., of Denver, Col. This company treats refractory gold ores by the Pelatan-Clerici process and is putting in plants on several mines.

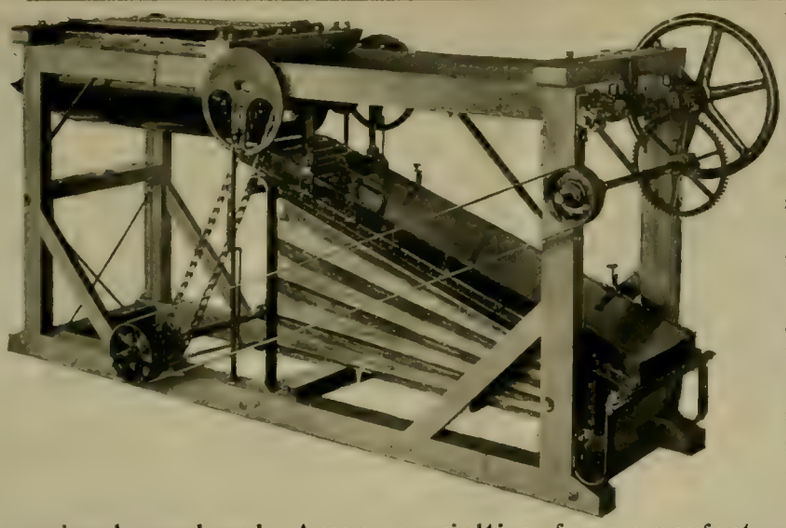
PROF. ALEXANDER AGASSIZ sailed Friday on the Monowai to explore the great barrier reef of Australia and similar coral formations in south Pacific waters. He is about the highest living authority on some forms of marine life, and his long-cherished plan to make extended research in the south sea will inure to the benefit of science. Prof. Agassiz spent a year in mine examination in this State in 1859-60, and is greatly interested in the progress of scientific gold mining since then.

## Catalogues Received.

JOHN TAYLOR & Co. (Incorporated), 63 1st St., Cor. 1st and Mission, San Francisco, Cal., catalogue and price list No. 6, 6x9 inches, 212 pp., profusely illustrated, containing prices and descriptions of assayers' materials, chemical apparatus, mine and mill supplies, including everything in the way of material required by assayers, chemists and millmen, with price and description annexed. Prospectors' outfits are specified, and differently priced assayers' outfits are quoted in their entirety. A list of books and their prices on assaying, mineralogy, chemistry, etc., is also published, and a complete price list of the chemicals most ordinarily used by miners and metallurgists, with reference tables and information, with index. The book is well gotten out typographically and will be sent to any address upon application.

UNION IRON WORKS, 222 Market St., San Francisco, Cal., catalogue No. 3, metallurgical and mining machinery, 10x7 inches, 203 pp., illustrating and describing in detail ore feeders, rock crushers, dies, cams, stamp heads and batteries, with specifications as to weights and requirements; steam stamps, gold and silver mills, plants for treatment of sulphurets, base ore roasting furnaces of various patterns, condensed description of the various processes, a treatise on concentration with a detailed account of the new Union concentrator; slime tables, Cornish rolls, smelting plants of various kinds, including different makes of water-jacket smelting furnaces, etc. The closing thirty-one pages of the work are devoted to miscellaneous information, practical and up-to-date, measures, weights, formulas, tables, etc., of value to every one connected with mining or metallurgy. The catalogue is an unusually fine one and will be sent upon application to any address.

GEO. W. KNEASS,



All kinds of Boats BUILT.
Gasoline and Steam Launches, Coffee Lighters, Row, Sail, Fishing, Hunting, etc., Metallic Surf and Life Boats for sale.
718 Third St., San Francisco, Cal.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.

WE make mining machinery of all kinds. We also "make the Miner," that is, Woods' Dry Placer Miner, as illustrated here. Users say it is "really perfect." In writing about it ask for catalogue 51.

Smelters are using our semi-steel moulds, kettles and pots extensively; they give first rate satisfaction. We are also making welded steel water jacket furnaces, better than anything previously produced. Among specialties of our manufacture are perforated metals; also riveted steel pipe for hydraulic lines. You will find us obliging in making estimates and giving particulars, as we aim to serve the interests of our customers in the best way.

# THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

## Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1) shows a cross section, and (Fig. 2) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

SAVE MONEY

BY USING

## THE "DANIEL BEST" CRUDE OIL ENGINE FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c. | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c. | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c. | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¾c per horse power per hour; on domestic coal oil, 1¼c per horse power per hour; and on gasoline, 2¾c per horse power per hour.

### Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics' labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight.

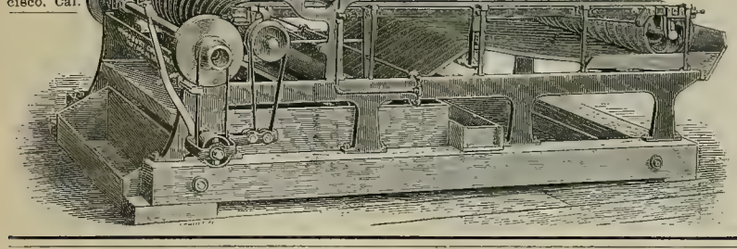
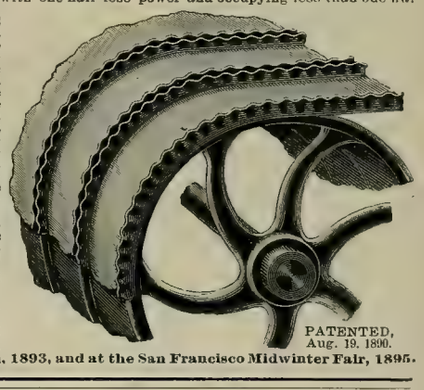
## CHICAGO GAS & GASOLINE ENGINE

Used for making Electric Light or furnishing power for any purpose required. Specially adapted for electric light in private enterprises. The latest great invention of this progressive age. Built in from 2 to 50 horse power. Stationary or portable. Is the simplest power on the market. A dwarf in size; a Samson in strength. Costs but little to run it. Has no equal for even speed and durability. Send for catalogue.

J. J. NORMAN CO., Mfrs., 53 S. Clinton St., Chicago.



# THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS



was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891

MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect; Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco, Cal.

PATENTED, Aug. 19, 1890.

**This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.**

For QUARTZ MILLS, HOISTING, PUMPING, DRILLING, and all Mining Work where Long Distance Transmission is required, a Specialty.

OFFICE AND WORKS:

34 and 36 Main Street, San Francisco, Cal.

IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, Discounts and Catalogues of our specialties of Hydraulic Mining Machinery sent upon application.

# Market Reports.

## The Markets.

SAN FRANCISCO, March 5, 1896.

Heavy deposits of snow on the mountain ranges and rainfalls in the valleys have created a greater degree of confidence in mining, financial and business circles. The snow deposits insure water in mining districts at later dates in the season, while the rainfalls in the valleys insure good crops, particularly of grain. This favoring condition inspires the belief that more active times are in store for all industries on this coast. I is the impression that the iron manufacturing industry in this city will enjoy a better degree of prosperity this year than for several years past, and this is always promotive of better times in all other industries. There is still a good inquiry for gold-mining properties, but prospective buyers are exercising greater caution as to the situation, condition and future prospects of the mines offered for sale.

**New York Silver Prices.**

NEW YORK, March 5.—Following are the closing prices for the week:

| | Silver in— | | | |
|---|---|---|---|---|
| | London. | N. Y. | Copper. | Lead. |
| Friday | 31⅛ | 68 | 11 | 3 25 |
| Saturday | 31 3-16 | 68⅛ | 11 | 3 25 |
| Monday | 31 3-16 | 68⅛ | 11 | 3 25 |
| Tuesday | 31¼ | 68⅛ | 11 | 3 25 |
| Wednesday | 31 5-16 | 68½ | 11 | 3 22½ |
| Thursday | 31 5-16 | 68⅝ | 11 | 3 25 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.86¾ |
| London Merchants | $4.84½ |
| London Sight Bankers | $4.88 |
| Refined Silver, peroz., 1000 fine | 68⅝c |
| Mexican Dollars | 54c |

SILVER.—The market has been declining since February 23d, when the price touched 70 cents an ounce. To-day quotations come through from London at 31 5-16d and from New York at 68⅜ cents an ounce. The receding of the market is said to be due to large holders in London having placed considerable quantities at the late advances, and that these sales meet the more urgent temporary wants of India and other demand countries. From all that can be learned the demand for China has been rather disappointing, but still the belief prevails that when that country comes in for new loans a considerable quantity of silver will be required. It is stated that the leading smelters in the United States have contracted their outturn for two or three months ahead. The output of the silver mines in this country, it is said, will not show an increase this year over that of 1895.

COPPER.—The local demand is slow for ingots, but at the East the consumption continues large, causing a fairly firm market. The jobbing trade reports a fair business for this season of the year. The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 14 |
| Ingot, wholesale | 13 |
| Sheet copper | 17 |

LEAD.—The market shows a fair degree of firmness at the East for pig. It is the belief that the consumption will be larger. This is founded on the advice that corroders are confident of large increase in the demand for paints due to a gradual improvement in the situation. On this coast it is now stated that the consumption will show quite an enlargement, owing to more favorable conditions in agricultural and mining sections.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 90 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—There is nothing new to report. There is nothing new in a jobbing way.

The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

QUICKSILVER.—Dealers look forward to a more active demand on this coast. The market is steady at the following quotations:

| | |
|---|---|
| Home trade, per flask | 40 00 |
| West Coast of Mexico, for Export | 35 00 |

BORAX.—The output on this coast is still restricted to actual requirements. The shipping demand is only fair, but an improvement is looked for.

The market is quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6½ |
| Refined, in sacks | 5⅝ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

TIN.—The European markets for tin have held to fairly firm prices. The movement seems to be somewhat of a speculative character. In our market no essential change is reported. Tinplate, both at the East and abroad, is slow. The consumption by canners will probably show a falling off this year for fruit-preserving purposes, but for other uses it will be fully up to last year's. For invoice parcels, the market is quoted at $3 95@4 00 a box, for manufacturing cans. The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14⅝c@14¾c |
| Plate, I C-coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—There is nothing new in the market. We quote the market at from 9 to 10 cents a pound.

COAL.—Liberal spot supplies and free shipments on the way cause a weak and somewhat demoralized market. It is stated that purchases have been made below quotations for to arrive and also shipment. The consumption of steam, it is expected, will be larger this year, but that for household purposes will be essentially unchanged.

The market is quoted as follows:

SPOT FROM YARD—PER TON.

| | |
|---|---|
| Wellington | $ 8 00 |
| Greta | 6 50 |
| Nanaimo | 7 00 |
| Gilman | 6 50 |
| Seattle | 6 00 |
| Coos Bay | 5 00 |
| Cannel | 8 50 |
| Egg, hard | 10 00 |
| Wallsend | 7 50 |
| Scotch Splint | 7 50 |
| Brymbo | 7 50 |

TO ARRIVE—CARGO LOTS.

| | |
|---|---|
| Australian | 5 25 |
| Liverpool Steam | 6 25 |
| Scotch Splint | — |
| Cardiff | 6 25 |
| Lehigh Lump | 9 00 |
| Cumberland | 13 50 |
| Egg, hard | 10 00 |
| West Hartley | 6 50 |

COKE.—Offerings on spot are reported to be heavy and quotations low. The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | @ | bbl. |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 8 50 |
| " in sacks | — — | @ | 9 50 |
| Cumberland | — — | @ | — — |

LUMBER.—Rains have interfered, temporarily, with the home demand, but the export movements are said to be large from milling points. There is still more or less cutting in prices.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 13 00 | @ | 18 00 |
| Spruce | 25 00 | @ | 30 00 |

NAILS.—There is an increasing outturn of wire nails on this coast, and consequently there is more or less selling competition. The consumption promises to be larger. The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 07½ |
| " jobbing, " " | 3 20 |
| Cut, carloads, " " | 2 82½ |
| " jobbing, " " | 2 95 |

## Mining Share Market.

SAN FRANCISCO, March 5, 1896.

As usual, the market moved on contrary lines the past week, for instead of going up as the many had been led to expect, it went off up to Monday, when Hale & Norcross showed more activity and sold at twenty per cent advance. The rest of the list did not sympathize much. On Tuesday the market hung at around Monday's prices, but Wednesday afternoon it strengthened. The strengthening allowed the Belcher Mining Co. to levy a 25 cent assessment, and Con. Virginia one of 30 cents. Other companies will follow and levy assessments soon. While believing that a turn in the market is near at hand, still the writer does not believe that there will be any deal for several months to come. The turns will, as it now looks, be in one or two stocks, which, after being sent up in price will be let alone and the market allowed to fall back, and then take up two others. These moves will be for the purpose of not letting interest in the market die out, and at the same time encourage holders to pay assessments. This opinion is based on the belief in well informed circles that there are quite a number of good sized blocks of shares held by outside parties in the hope the market will be put up and they be able to sell out at a good profit. Parties able to make a good sized deal being cognizant of this are not slow to encourage them to hold and pay assessments, so the mines can be well exploited. The writer will venture the assertion that until conditions at the East are greatly improved there will not be anything in the share market except small spasmodic moves. In a presidential election year it is not to be expected there will be as much of a change for the better in speculative markets, but it is reasonable to expect dull and dragging markets. This is experience derived from the past, and it is quite safe to claim that it will hold good in the future. While saying this, yet it must be conceded that there is work under way in some of the mines on the Comstock that deserves watching, although it may be several months before it reaches the points desired. The observance of Sunday on the Comstock will cause less work to be done, besides which, fewer men are employed. One mine, Con. Virginia, laid off quite a number of miners the past week. In this city brokers are said to be feeling the depression more than ever. They seem to be following in the footsteps of the Stock Exchange by reducing expenses, some even say they intend going out of the business until times improve. This kind of talk comes every few years, but still they do not go out, but continue along well knowing that the Comstock has as many lives as the proverbial cat, and when it is least expected a new lease of life is given to the industry by an important ore strike and a share deal.

The reported contest for the control of Hale & Norcross is not attracting much attention. Outside of the "ins" trying to keep control and the "outs" trying to get in, presumably to draw salaries, very little interest is being taken in the contest. Moneyed men were never known to let the public in on a "good thing;" they want it themselves, and reasoning on this basis it seems strange that the contestants are so anxious to have outside holders of shares not sell but give them their shares for voting purposes. It may be all right, for no one can tell, yet it looks rather strange.

News from the Comstock mines is not materially changed since our last week's review. The general situation is full of encouragement that there are better things in store, yet the work, as it is understood, will take quite a number of weeks if not months before the objective points sought, and when found the expected ore may not develop as large and as rich as miners look for. In Alta dilatory work is still the order in the vicinity of the Keystone ledge. This ledge, wherever it has been struck, has heretofore proven rich, and it would seem singularly strange if it should prove contrary now. It may take another assessment yet before the rich strike can be made. In Overman, while exploiting work is under way, a few tons of good ore is extracted each week. The assessment on Belcher ought to give the company sufficient funds to more actively prosecute the work to the west, where it is believed there is good to high-grade ore. In Crown Point active work is still the order, but it takes money and funds from a 20-cent assessment do not last long. From Yellow Jacket no news is allowed to leak out. In Challenge and Confidence the work is still of a skirting character. It looks as if they are trying to find out the extent of the ore found about a year ago. In the Con. Imperial west drift slow work is being made. Miners are confident that they will strike the west lode before the year passes. In Alpha they are still "fooling" around the vicinity of the west lode. How much longer time will be required for the work is still an open question. In the middle mines the most active work is being done, and better results follow. From each of the mines ore is being extracted while exploiting or developing them. The quantity of the ore is not sufficient to pay expenses, unless Hale & Norcross be excepted, yet it helps to keep off assessments. From Gould & Curry and Best & Belcher nothing of interest comes to hand and all interests seem to be centered on Con. Virginia, and apparently correctly so. The work in this mine is on several levels and seemingly done for the best interest of shareholders. Miners are confident of good results within the next nine months from the work going on in the 1750 and 1000-foot levels. In Ophir, Mexican, Union and Sierra Nevada the work that is being done seems to be for the purpose of laying the foundation for more activity next summer or fall.

From the Brunswick lode our advices continue to report active work, particularly in Occidental. As yet the results have been disappointing to some, still those in control have confidence in the mine. This is emphasized in the work that is being done. Work in the other mines on the lode is not being pushed so energetically as is that in Occidental. This is doubtless due to a desire to see what will result from that in the latter mine. If a strike of a large body of good ore should be made then the other companies will increase their forces of men and prosecute the work more energetically.

From the Bodie district nothing of interest comes to hand. So far the work done in several of the mines has resulted in nothing more than depleting the funds in the treasury, which will necessitate assessments before long.

The monthly financial statements are as follows:

| BODIE MINES. | | | |
|---|---|---|---|
| Bodie | $ 6,745 | Crown Point | $ 2,497 |
| Bulwer | 195 | Exchequer | 3,716 |
| Mono | 2,871 | E. Sierra Nev | |
| Standard | 22,153 | Gould & Curry | 1,308 |
| Syndicate | 782 | Hale & Norc'ss | 10,804 |
| | | Julia | 900 |
| | | Justice | 2,303 |
| COMSTOK MINES. | | Kentuck | 2,322 |
| Alpha | $ 3,961 | Lady Wash'n | 624 |
| Alta | 4,296 | Mexican | 11,632 |
| Andes | 423 | Ophir | 4,539 |
| Belcher | 279 | Occidental | 5,077 |
| Best & Belcher | 5,337 | Overman | 5,870 |
| Bullion | 3,336 | Potosi | 18,203 |
| Caledonia | 1,018 | Savage | 4,226 |
| Challenge | 1,078 | Segr. Belcher | 1,067 |
| Chollar | 16,191 | Silver Hill | 311 |
| Confidence | 4,542 | Sierra Nevada | 755 |
| Con. Cal. & Va | 6,355 | Union Con | 17,366 |
| Con. Imperial | 2,501 | Utah | 457 |
| Con. New York | 1,295 | | |

The following illustrates the changes of the week:

| MINES. | Feb. 27. | Mar. 5. |
|---|---|---|
| Alpha | | |
| Alta Consolidated | | $ 14 |
| Andes | | 27 |
| Belcher | | |
| Best & Belcher | $ 76 | 70 |

**Treatment of Gold Ores by the Pelatan-Clerici Process.**

The General Gold Extraction Co. Ltd., of Denver, Colorado, has just issued a neat and comprehensive pamphlet explanatory of the treatment of gold ores by the Pelatan-Clerici process. The remarkable results reached in the treatment of refractory ores by this process is fully and clearly set forth and should be read by every mine owner in the west, who wishes to be informed of the latest up-to-date discoveries in the economic treatment of refractory low-grade ores. The pamphlet will be sent free to any address upon application.

## GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

## Mining Property Wanted at Once.

TWO COPPER MINES.
TWO QUARTZ MINES—Dividend Payers.
ONE MANGANESE.

J. F. CROSSETT,
628 SACRAMENTO ST, SAN FRANCISCO.

## FOR SALE.

Complete plant for mining on an economical scale, including hoisting, pumping and drilling machinery, tools, etc. Near railroad station in central California. Address,

BOX M,
Mining and Scientific Press Office.

## DIAMOND DRILL
FOR SALE.

1 Sullivan Hand Prospecting Drill, size M, with full equipment; also extra Carbons and 250-foot Drill Rods, little used and guaranteed in first-class order. Will sell cheap.

NIAGARA MINING COMPANY,
French Gulch, Cal.

## A Practical and Competent Millwright,

Millman and Assayer; also Mining Work of any kind, WANTS POSITION. Address R. K., this office.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR WEEK ENDING FEBRUARY 25 1896.

555,201 LOCK JOINT—H F Ascheck, Alameda Cal

555,208 ELECTRIC RAILWAY—C M Bridges, Seattle Wash

555,247 CAN SOLDERING—F V Butler Elko Nev

555,167 LADLE—W Hainsworth Seattle Wash

555,247 CAN SOLDERING MACHINE—M Jensen Astoria Or

555,173 LIFE SAVING DEVICE—W H Martin Los Angeles Cal

555,167 CUT OFF VALVE—J B Pitchford, S F

555,181 CAR VALVE BOX—A D Richmond, Santa Barbara Cal.

NOTE—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible on mail or telegraphic order. American and Foreign patents obtained and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention.

LOCK JOINT. Henry F Ascheck, Alameda, Cal. No. 555,201. Dated Feb. 25, 1896. This invention relates to that class of joints rigid or bendable as required, and which may be properly termed "lock" joints. It consists in a joint composed of a pin or stud in each of the parts to be joined, and a guide in each of said parts to receive and permit the travel of the pin or stud of the other part, said guides being corresponding but reversed and each having a portion in which the other's pin or stud may play about and move past its own pin or stud whereby the joint is bendable, and a portion in which each pin or stud is locked and locks the other against a movement about each other whereby the joint is rendered rigid. The object of the invention is to provide a joint applicable in all cases and to all structures in which a part or member has at one time to be turned or moved with relation to another and at another time to be held rigid or locked with respect to that other.

CONDUIT ELECTRIC RAILWAY. Christopher M Bridges, Seattle, Wash., assignor of one-fifth to John S Fanning of San Francisco, Cal. No. 555,208. Dated Feb. 25, 1896. This railway consists of the combination of a series of rollers in the conduit, swinging arms on which said rollers are mounted, insulated sections or pieces carried by said arms, contact pins slidably mounted and positively and normally bearing on said insulated sections or pieces and an electrical connection from said pins to a supply conductor and a contact bar carried by the car and having electrical connection with the motor thereof, said bar being adapted to travel in contact with said rollers and by said contact to swing the arms successively to throw the contact pins from the insulated sections of the arms into electrical connection with said arms whereby the circuit of the motor is established. The contact bar carried by the car conforms to the several bends and curvatures of the track, and to this end its best and preferable form is in the shape of a bar rendered flexible either inherently or by means of its hangers.

CAN SOLDERING MACHINE.- Matthias Jensen, Astoria, Or., assignor of one-half to Jensen Can Filling Machine Co. No. 555,247. Dated Feb. 25, 1896. This invention relates to improvements in machines for soldering cans, and it is especially applicable to the soldering of the end seams of square, oval and other shaped cans in a single machine. It consists of a series of stalls adapted to receive and turn the can so that the seams are dipped into the molten solder, the stalls being carried over the soldering trough by a horizontally moving carrier and being so constructed that the cans are movable between the parallel sides of the stalls, while being rolled on their largest diameters. In conjunction with this is a mechanism for feeding the cans successively into the openings of the stalls as these openings pass beneath the chute which carries the cans, so that each stall will receive a can as it passes, the cans being delivered upon a carrying discharge belt at the opposite end of the apparatus.

## Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY. Location of principal place of business, San Francisco, Cal. Location of works, Auburn, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 20th day of February, 1896, an assessment (No. 2) of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 25 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of April, 1896, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on THURSDAY, the 30th day of April, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office, 25 Twelfth street, San Francisco, California. Office hours, from 9 to 10 A. M.

GOLD BAR CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of February, 1896, an assessment (No. 3) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 38 Crocker Building, San Francisco, California.

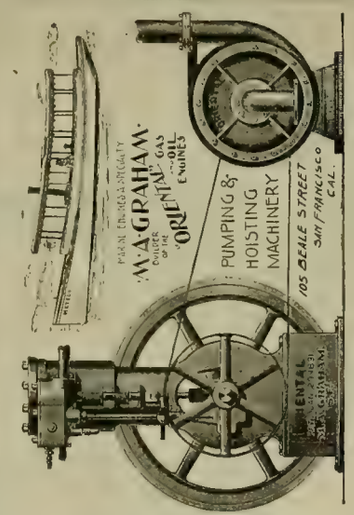
Any stock upon which this assessment shall remain unpaid on the 19th day of March, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 10th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, 38 Crocker Building, San Francisco, California.

CON. CALIFORNIA AND VIRGINIA MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Storey county, Nevada.



Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of March, 1896, an assessment (No. 6), of 30 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of April, 1896, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 28th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

This process has a well demonstrated merit in treatment of low grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and Silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

## A Dry Placer Machine.

Dry washers, machines designed to extract gold from dry ground, are in constant demand on this coast, and their use is extending to South Africa. There are a good many different designs and makes. While recently in Denver, Colorado, the writer saw five of varying construction, from the old fanning-machine type to a more elaborate and complicated system, the air blast and agitation of the contents being the two features common to all. Herewith is illustrated a new washer—the Reed dry placer machine. It has two motions, longitudinal and lateral, in combination with an air blast. The earth is shoveled into a chute, from which it feeds automatically into a hopper of the machine, in which is a coarse screen. The jigging motion throws out all the rocks and coarser gravel, the finer material falling through into the bottom of the top device, in which are steel uprights which act as artificial fingers, continually stirring it. The movement of the machine causes the lighter particles to flow over the riffles, where it meets a second screen of finer mesh; here the material is still finer concentrated, throwing out the coarser particles. The finer material falls through this second screen into the hopper of an air-blast device, from which it feeds across another series of riffles, the effect of the side motion. The material in passing these riffles is subject to an air blast from a revolving fan or blower in the air chamber beneath, strong enough to keep each particle of dirt in constant motion, the fine gold settling behind the riffles, and the waste material passing over and out of the chute. Should any flour gold sift through these last riffles it falls into a catchpan. The material is concentrated down to two or three pounds and is cleaned up in the usual manner. The makers claim the top device catches all the nuggets and coarse gold, and a great part of the fine, while the lower catches what fine gold is lost from above. The machines are made of several sizes, from ten to sixty tons capacity, weigh from 100 to 1000 pounds. The makers, who have a machine in present operation at Fifth and Kirkham streets, Oakland, Cal., say that it will save 95 per cent of the gold.

A JOHANNESBURG, South Africa, paper which expresses regret at the prevalent outside ignorance as to localities, informs its readers that "steps are being taken to reopen the mines of Chicago and Philadelphia."

MULTIPOLAR SLOW-SPEED GENERATOR DIRECTLY CONNECTED TO A DOUBLE CROSS-COMPOUND ENGINE.

DRY PLACER MACHINE.

## Multipolar Slow-Speed Generator.

The accompanying engraving of a Card Electric Motor and Dynamo Co.'s type H multipolar slow-speed generator, directly connected to a double cross-compound engine, is made from a photograph of a machine that furnished light and power at the Atlanta Exposition. The speed is 275 revolutions per minute. J. W. Brooks & Co., 523 Mission street, San Francisco, are the general Western agents.

THE Marysville, Cal., *Democrat* affords a good example of a "home industry." Since June 1st, '90, it has paid in its newspaper and job office for labor, rent, water, gas and fuel $69,230, every cent of which has gone into immediate circulation in the community where the *Democrat* is published. A great part of this money has been received from outside sources. Were a similar institution—similar in its benefits to the people of Marysville—to propose starting there, the citizens of that town would feel like offering a big bonus for the enterprise, and they would be right. Entirely apart from this matter of gathering outside money and paying it out in the local community is the attribute of good in a newspaper's talking for the place where it is published, and from whence it draws its main support. This is an attribute possessed by no other manufacturing establishment in the same degree. These remarks apply to every part of the State. Probably no other State in the Union has such a bright, intelligent press. In every nook is published a paper that reflects the local life, says all possible good of its community, extols its surroundings and presents their best features in the most attractive way. It spends nearly all its income among the people in its immediate vicinity, it talks continually for its section, brings to notice anything of value or merit, and very often is unappreciated. The editors of California papers are foremost among the hard-working benefactors of the State, and deserve the highest meed of favor that fortune may bestow.

AT the Magalia mine, Butte county, J. B. Haggin and N. D. Rideout are spending considerable money in sinking a 500-foot shaft to strike the gold-bearing channel. At a depth of 300 feet a stream was tapped that involves considerable outlay in handling, but the ultimate result is considered to justify the expenditure.

Commercial Paragraphs; Recent Mining Dividends; Recent Mining Incorporations, 211. Coast Industrial Notes; Personal; Obituary, 212.

MINERS in the State of Washington are justly indignant at the questionable conduct of some U. S. officials in the matter of the opening of the Colville Indian Reservation. It was anxiously awaited by several hundred eager prospectors who were on the line awaiting the news of the signature of the bill by President Cleveland. It was generally known that the bill would be signed and intense interest was manifested. With considerable show of truth, it is now claimed that the news of the signature of the bill was withheld through the influence of two or three federal officials, who suppressed the news till after their representatives had secured some of the choicest mining claims. Ordinarily, the Press Association has the minutest detail of news from Washington, and if a Congressman walks across the corridors of the Capitol more quickly than usual, or a postmaster is appointed at some country cross-roads, the important fact is wired at once. Yet though a hundred telegrams were sent asking for the news the moment the bill was signed, and the general interest in the matter was well understood, the fact that the President had signed the bill was kept from the miners for twenty-four hours. It was a trick; and if investigation be pushed, it is probable that President Cleveland would find cause for some removals.

REGARDING the propositions relative to the debris problem, it is to be briefly said that the only measure of any practical value is that advocated by the California Miners' Association, which pays due regard to the interests of mountain and valley dwellers alike. While the Anti-Debris Association is holding meetings and resolving against receiving help from any source, Governmental or otherwise, unless all former legislation is rescinded and the creation of the world begun anew, the Miners' Association, endorsed by the Boards of Supervisors of several counties and the leading commercial organizations of the State, is going ahead securing such Congressional action as will inure to the benefit of the farmers and the miners on the only possible line that can afford desired relief. Instead of beginning do novo to secure the attention of Government engineers as tardily suggested, the effort is making with great probability of ultimate success to secure $250,000 in the forthcoming federal appropriation bill, which will unlock the State appropriation of like amount and enable the U. S. Government engineers to go ahead in accordance with Section 26 of the Caminetti act, which "directs and empowers said Commission when appropriations are made" to use the money so appropriated under Government direction. So far as observed, there is not a single business reason advanced by the anti-debris people for their opposition. They appeal to prejudice and hold post-mortems, but their points are poorly taken. The thing amounts to this: Granting, for the sake of argument, that all they say is so, the matter can only be remedied by the use of money, intelligently and judiciously spent. That money can only be procured by an appropriation. And only by unity and harmony can any appropriation be secured. The only present obstacle to the valley residents securing aid is by their own senseless opposition to those who seek to mutually help all.

## The Mineral Land Bill.

The progress of the Mineral Land bill through the National Legislature has been watched with considerable interest by the miners of California. Nearly a month ago it passed the lower house, and has since been before the Senate committee, during which time it has been the subject of several proposed amendments. Many who have labored long and earnestly for a measure so necessary to the mining interests of the State had hoped it would go through the Senate unchanged and receive the President's signature, but it has found formidable opposition from the very source that should favor it—the Interior Department of the Government. Commissioner Lamoureaux of the General Land Office appears to be impervious to information. Having formed an opinion while disregarding the facts of the case, he ignores all argument or just statement and continues to advance objections that have been long since answered. He now makes objections to the bill that were shown to be baseless, and urges the cause of the corporation in a way that is usually adopted by a paid advocate. His great influence is thrown against the Government, of which he is an officer. He ignores the fact that the California miners ask nothing. They simply want to have the question of title determined, preferring to pay the Government rather than the railroad company. Mr. Lamoureaux seems to prefer that the Government should get nothing, and that the miner shall be compelled to secure costly title from the railroad company when it shall have unjustly absorbed so considerable a part of the public domain.

It is difficult to speak with ordinary courtesy of a Government official who, for occult reasons, steadily favors corporation methods which savor of addition, division and silence, and steadily opposes the rights of the Government and the just demands of the miners who represent public interests. The paid adherent of the railroad company who argues for his employer can at least claim that it is his duty to work for his master. But even the ability to preserve his self-respect is denied the recreant who swears to faithfully discharge the trust confided to him and prostitutes his office to the benefit of the recipient of private gain. At the start the Commissioner might have been acquitted of ignorance, but his steady opposition in the face of the clearest explanation is of that nature that usually arouses suspicion of official honesty.

He places his objections before the committee in writing. On the 11th inst. a letter was sent to Senator Dubois of Idaho, chairman of the Senate Committee in present charge of the bill, signed by U. S. Senator Geo. C. Perkins, U. S. Senator S. M. White, Congressman W. W. Bowers and Tirey L. Ford, representing the California Miners' Association, which says:

Regarding H. R. 5819, and letter 3, from the honorable Commissioner of the Land Office in relation thereto, dated March 4, we desire to say: The criticisms of the Commissioner may be briefly indicated as follows:

First—The honorable Commissioner says: "The lands to be classified under the bill before me are situated within old and well settled communities, are generally surveyed land and presumably have been thoroughly examined and explored by prospectors."

The Commissioner then draws the conclusion that the lands which have been thus explored and prospected should not be made the subject of further examination and classification. From our personal knowledge of the situation, we are able to state that the Commissioner has fallen into error as to the result of former prospecting in the mineral regions of California. The hasty, superficial and methodless prospecting of earlier years in our State is but now giving place to scientific and skillful methods. Abandoned mines are being reopened, more attention is being paid to the development of our mineral resources, and, in short, capital is being attracted to the mineral regions of California as never before in the history of the State, since the first few years of feverish excitement following the discovery of gold on the American river in 1848.

Furthermore, many small claims in the mountains are held by men of humble means, which claims have not yet been patented, but are held by work and possession under the Federal mining laws. The owners of these small mines, living, as they do, in isolated districts, far removed from populous centers, frequently have no notice of intended patents to railroad companies, and their claims are consequently swallowed up by railroad patent.

It is impossible within the brief space of a letter to explain the situation as it exists or to state all the reasons why the classification sought for should be made. We may say, however, that it is a well-known fact among the miners of California that prospecting along methodical and scientific lines has just begun in California, and that it would be a severe blow to the development of the mining industry as well as a grave financial loss to the United States to permit any considerable portion of the mineral lands of that State to be patented to railroad companies

Second.—The honorable Commissioner says: "The cost of examination and expenses in the Idaho district was 6.2 cents (per acre, of course) the cost in other districts (Montana) ranging from 1.15 to 2.3 cents per acre." Just why the classification in California should cost 6.2 cents per acre and why Idaho should be taken as a standard of comparison is not clear. The contested lands in California lie mostly in the Central Pacific and California and Oregon grants. The unpatented lands within these grants comprise altogether 1,331,494 acres, or less than 1,500,000 acres out of 7,500,000 to be classified. A good many thousand acres of Central Pacific and California and Oregon grants lie in the Sacramento valley, in Butte and Tehama counties, while other portions thereof are in barren regions of Lassen and Modoc counties. Less than a million acres within the two grants above mentioned would require careful examination. Proceeding southward through the San Joaquin valley and over the Tehachapi mountains into southern California, the work of the commissioners will not be difficult. This matter was fully explained orally at a recent meeting of your committee and need not be repeated here. We can see no reason why it should cost more in California than in Montana. On the contrary, the very fact, as stated by the Commissioner, that California is an older State and her lands better known and understood would make the task of the commissioners fer California easier. The evidence of witnesses would be more easily obtained and an examination of contested lands more quickly made.

Third—The honorable Commissioner suggests the following amendment to Section 3 of the bill under consideration, namely, by adding to Section 3 the following language: "And provided, further, that this act shall not apply to any lands in which publication has been made or be ordered made by the General Land Office under a circular of the Department of the Interior, approved July 9, 1894, and that all such lands so published or ordered to be published shall proceed to patent under now existing regulations.

The exclusion of published lands as suggested by the Commissioner, while it might save the Government the small expense of publication already incurred, would lose to the United States and to the miners a large portion of the very lands sought to be saved by the creation of the proposed commission. It is apparent that the efficacy of the proposed measure would be seriously crippled if the lands already published, but not patented, were excluded from its operation. The mineral lands within these published lands belong to the Government and not to the railroad companies, and the reasons that apply to the setting apart of mineral lands in other portions of the railroad grants apply with equal force to the published but unpatented lands.

Fourth—In speaking of the recent procedure in the land department, the Commissioner says: "This procedure has protected the rights of mineral claimants so well that no complaints have been made of its action by them." Has the Commissioner fallen into an error as to facts? The dissatisfaction with the present procedure is strong and universal among the miners of California. The California Miners' Association, which is composed of leading mining and business men of that State, expended over $5000 in the year 1895 in fruitless efforts to prevent the patenting of mineral lands to railroad companies. The records in the office of the Commissioner of the General Land Office have been considerably augmented by protests, briefs, etc., proceeding from the California Miners' Association. The association sent a personal representative to Washington in the summer of 1895 to lay the above matters before the proper officials. The fact is the miners of California have been compelled to ask Congress for the relief which they now seek.

Referring to the suggestions made by the members of your committee to the effect that the proposed inquiry should be limited by the exclusion of known agricultural lands, we desire to say that we know of no feasible way to accomplish this entirely desirable result. The California Miners' Association, through its appropriate committees, discussed this very question with a view to modifying the proposed bill as above suggested. They discovered, however, that it was impracticable to designate a geographical boundary line that would properly designate the lands sought to be classified. A designation of lands by altitude was also found impracticable. They also found it impossible to designate lands by counties, since nearly every county affected by these land grants lies partially in valleys and partially in mountains.

The people of the State of California are just as anxious to have this work expeditiously done as are the officers of the Government, for until these lands are properly classified, mineral titles in California must remain in a large part in an uncertain condition, and prospecting and development of our mineral resources correspondingly retarded. We feel, however, that we can safely assure your committee that any commission that may be appointed by the President will have no difficulty in segregating and setting apart with small expenditure of time and money large tracts of agricultural lands that may be found within the railroad land grants. The result of the consideration of this matter by the California Miners' Association was that the only safe and practicable method to be employed was that adopted in the so-called Idaho-Montana act, with which act your committee is familiar, namely, the designation of lands by land districts.

No one not familiar with the conditions in Californian can appreciate the deep interest taken in this subject, not only by those directly interested in mining, but likewise by the people generally. The criticisms which have been made, entirely irrespective of party, upon the plan heretofore adopted for the issuance of railroad patents have been emphatic and practically universal. The laws and regulations now in force are utterly ineffective, and as far as California is concerned we do not hesitate to say that no interest disconnected with a railroad company is satisfied with the prevailing conditions. Every member of the California delegation favors this bill, to say nothing of the representative gentlemen from that section who are here solely in furtherance of its enactment.

The above is a concise, dignified and truthful answer. More might be said: less could not be said.

It is understood at this writing that the committee will report the bill favorably with three amendments: reducing the compensation of the commissioners to $10 per day, without expenses; limiting the time within which lands are to be classified to four years; directing the commissioners to classify large bodies of well-known agricultural lands upon testimony taken and without personal examination, by legal subdivisions. Senator Carter of Montana insists on the first and third.

There is no objection to those three amendments purely as improvements. Indeed the first is of merit, as it removes from the list of possible aspirants to the position of commissioner a class that is not wholly conducive to the best results; the second amendment appears to be unobjectionable, as it places a definite limit to the life of the commission. It is not the character of the amendments that is objected to, but knowing that amending a bill that has passed one house of Congress is a favorite way of defeating it, the friends of the Mineral Land bill fear that the effect of any amendment, however unobjectionable, may be to defeat it when it comes up for concurrence.

LEGAL complications at the Carley mine, Murphys, Cal., have been straightened out, and sinking and other development work resumed.

ON the 3rd inst., the Virtue mine, Baker Co., Or., sent to Baker City $9000 in gold, the result of 25 days run. The mine continues to show well.

THE Golden Fleece, Colorado, has declared its usual monthly dividend of three cents per share. This is the twenty-ninth consecutive dividend.

THE production of gold in western Australia for the year 1895 is officially reported at 231,513 fine ounces, against 207,131 ounces in 1894, and 110,891 ounces in 1893.

THE New York Mining Exchange, which recently opened with prayer and champagne, seems afflicted with an intestinal disorder which may detract from its usefulness.

H. C. STEELE of Perris, Cal., is reported to have secured control of the Desert Queen, of which so much has recently been said and sung, and it will now be worked for profit.

THE secretary of the Northwest Mining Association writes that the next annual meeting of that organization will be held on Oct. 3d, '96. The membership is rapidly increasing.

ALL the idle men in Boundary Creek district rushed to the Colville Indian reservation on receipt of the news that the President had signed the bill throwing it open to prospectors.

DEEP SNOW has occasioned the closing down of the Empire mine, Gold Valley, Sierra Co., till May 1st. Work at the Hidden Treasure has also closed, temporarily, for the same reason.

THERE are now five cyanide reduction plants in the Camp Floyd, Utah, mining district, with a capacity for the treatment of between 700 and 800 tons of ore per day of twenty-four hours.

THE bullion report from the Daly and Ontario (Utah) mining companies shows that the Daly between February 6th and 29th produced 104,023 fine ounces of silver, and that the latter turned out 68,703 fine ounces.

THE big Bennett amalgamator at Green River is reported to be a success. It is represented to have the enormous capacity of 4000 yards per day; the gravel runs from 12 to 30 cents per yard. The plant has cost $60,000.

THE *Mail* says the Board of Trade of Colorado has adopted a rule that divides its listed properties into two classes, *i. e.*, shippers and prospects. No mine will be considered a shipper unless it can show $5000 in mill returns.

ON the 18th the stockholders of the Centennial-Eureka, Utah, Mining Co. will formally accept an offer of $3,000,000 for the property by an English aggregation. In the deal there is a 10 per cent commission for a St. Louis man.

THE sub-committee of the Senate Committee on Territories have made a favorable report on the bill to admit New Mexico to statehood. It may go through the Senate, but fear of the silver question will paralyze action in the lower house.

MESSRS. CALLAHAN & RAND, who have been experting British Columbia properties, have bonded the Deadwood claims, Trail Creek, for one year for $35,000. They agree to do daily $25 in work until the date of the last payment, March 1, '97.

A RECENT contract for nearly seven miles of pipe, to be delivered at Santa Ana, Sonora, Mexico, with competition between English and American manufacturers, went to the latter at a price two cents per foot cheaper than the lowest English bid.

A LOS GATOS, Cal., subscriber asks if an empty bottle, tightly corked, be forced down in the ocean 1200 feet, will it, if brought back to the surface, be found to contain water, and, if so, why? If the bottle be intact, when again brought up, it will still be empty.

THE Shasta *Courier*, the second oldest newspaper in the State, celebrates this week its 44th birthday. For thirty-six of those forty-four years the *Courier* has been a welcome weekly visitor in this office, and its excellence and reliability entitle it to favored recognition.

THE fight for the control of the management of the Hale & Norcross resulted last Wednesday in Jeremiah Lynch securing a majority and appointing a new board of directors. R. V. Collins was chosen secretary at a salary of $125 per month, reduced from $200. T. W. Tangerman was appointed to the consolidated position of foreman and superintendent at a salary of $175, a reduction of $200. Other savings were inaugurated in salaries, rent, etc., which imply a reduction of over $500 per month in expenses.

THE Australia Broken Hill Proprietary officially reports that for the week ending February 27, 6438 tons of ore were treated, yielding 419 tons of lead, containing 118,864 ounces silver, also 1058 tons treated by amalgamating and leaching plants, producing 11,528 ounces silver.

IN the Victoria B. C., legislature the government will probably amend the proposed tax bill to tax a two per cent value, less freight, and an amount not to exceed $5 per ton for mining, the improvement not to be taxed. A bill is also being considered to tax timber used for mines in amount exceeding 40,000 feet.

THE penalty for using or attempting to use to pay postage any canceled or marked postage stamp or postal card, or to sell or to offer to sell the same, is not less than six nor more than twelve months' imprisonment, or a fine of not less than $100 nor more than $500, or both such fine and imprisonment, at the discretion of the court.

IN the U. S. Circuit Court this week Judge McKenna denied the demurrer of the North Bloomfield Mining Co. to the action brought by the Government to compel the company to comply with the requirements of the Debris Commission. The case is of interest, being virtually a test of the constitutionality of the Caminetti act.

REPORTS from the Bozeman, Montana, tunnel are to the effect that it will probably be a total wreck. The flames are burning more fiercely, and small cave-ins are occurring frequently. All the summer's work is rapidly being eaten away. Freight traffic at that point is suspended, the yards and city on either side filling up with freight cars.

PEOPLE from the East tell the Denver *Record* that all literature relating to gold mining is eagerly read by all classes. In the small towns the vivid descriptions of the "Great Humbug" mines (whose stock can be had of the promoters at 'steen cents or less a share) are read with interest and the pamphlet is passed from hand to hand until worn out.

ON a basis of $12 per ton, the *Tribune* figures that the Golden Gate mine at Mercur, Utah, is worth $5,000,000. Capt. De Lamar and Manager Robinson are now at Mercur figuring on the erection of a mill with a daily capacity of 500 tons. It now costs the Mercur $3.25 per ton to treat its output, and the idea there is to reduce the cost to $2.25.

EMIL ABADIE, formerly of Grass Valley, Cal., is now in charge of the Buffelsdorn mine, Witwatersrand district, South Africa, where in December seventy stamps ran twenty-seven days, crushing 10,258 tons of ore, yielding 1660.98 ounces; 7630 tons of tailings were treated, yielding 2351.48 ounces, a total of 4012.46 ounces, or $9^{7}_{4}$ pennyweights per ton.

SUPERINTENDENT CHURCH of the Boise assay office reports that the mineral output of Idaho in 1895 was $10,110,485—an increase of $316,405 over 1894; the gold output being $2,594,666—an increase of $285,891 over the previous year; silver, $5,214,498—an increase of $334,643; lead, $2,301,321—a decrease of $304,129. The decrease in the lead output is due to the shutting down of the Shoshone county mines last June.

"INQUIRER," Silverton, New Mexico, is informed that while "Concentrates" is always glad to answer, if possible, any question of general information within its sphere, in matters of individual interest or special bearing on property rights, etc., it is best to consult some competent lawyer. Before making any move in the matter referred to, "Inquirer" should secure legal advice from some good mining lawyer, and be governed accordingly.

MANAGER P. T. FARNSWORTH sends the annual report of the Horn Silver, Utah, Silver Mining Co. During '95 20,000 tons of ore of an average value of $20.56, or a total of $392,416.17, were taken out and shipped, being crude ore and concentrates. The former went to the Germania smelter, the latter to the Pennsylvania Smelting Company. The mine distributed dividends amounting to $5,080,000 among its shareholders.

AT the Wemmer, South Africa, gold mine, the net January profit was £7953; at the Simmer and Jack, £5347. The Robinson, on Feb. 15th, reports: "Mill closed in consequence of native labor difficulties getting worse; will start work again in a few days; it is just possible will have to shut down chlorination and cyanide works; doing everything possible with regard to native workmen; not hopeful of immediate relief unless the Government will grant immediate assistance."

THE difference in the market price of metals, under increased demand and improved methods of production, is noticeable in the case of aluminum. For some years it was a chemical curiosity, then its value being apparent, it came into use. A few years ago its price precluded its general use—$2 per pound. More recently the price fell to 60 cents per pound and now the Pittsburg Reduction Co. state they are selling aluminum made from scrap at the rate of 35 cents per pound, in ton lots.

PRESIDENT NEFF, of the California Miners' Association, in accordance with a resolution passed at the last meeting of the executive committee has appointed a committee of four to confer with himself as to the recommendation to President Cleveland, in the event of the mineral land bill becoming a law, of suitable appointees to the proposed commissionerships. The committee consists of Chas. F. Hoffman, Edward Coleman, C. G. Yale and Jno. M. Wright.

IN the State of Washington nearly three-eighths of the total area of the State is claimed by the Northern Pacific as part of its land grant. Of this it is estimated twenty-five per cent is included in the mineral belt—that is, between 6000 and 7000 square miles. In this strip of Northern Pacific lands are included the St. Helens mining district, the Entiat, the Egypt mines, those of Cedar canyon and the Loon Lake country, the Metaline and Newport mining districts, and the whole of Swauk creek, Peshastin and adjacent districts.

IF all that our southern Oregon subscribers write us is borne out by developed facts, that region is unusually rich in a variety of mineral resources. A Grant's Pass man now writes that he has a deposit of bismuth. This brittle metal is of considerable commercial value, and at present is worth about $2 per pound. Bismuth has been found at various places in this State, Utah, Colorado and Arizona. The most important deposit, so far as the writer knows, is at the Bismuth Queen, near Golden, Colorado. The principal reducers of the ore are in Saxony and London, the ore mostly coming from Australia, though Schneliburg, Saxony, yields some native bismuth in its cobalt mines. The process of reducing bismuth ore is roasting, smelting and subsequent cupellation. Where designed for medicinal purposes, the metal must pass through a special process of purification.

CONGRESSMAN HYDE of Washington State writes that he fears the California mineral land bill will fail owing to the opposition of Lamoureux and other interior department officials, and that if it does he will have a substitute bill framed for Washington alone. And if he does Mr. H. may rest assured that will fail also. Unless the California bill goes through all right and becomes a law, Oregon and Washington need not expect to secure similar legislation and the sooner our northern friends realize that the better for all concerned.

THE Broken Hill Proprietary Co., N. S. W., think they have solved the problem of economically reducing the enormous quantity of sulphides hitherto of no commercial value at the mine. A. E. Ashcroft has demonstrated a method which has resulted in the formation of a London company with £1,000,000 capital to buy the patent, build and operate a plant. Mr. Ashcroft's plan embraces the extraction of the silver and lead and, incidentally, the production of zinc. It is in the economical production of this last that the profit of the new system lies. If the plan proves successful, there is enough ore to insure dividends for many years.

COLORADO now begins to argue that all mining stock should be made assessable. Paying mines need no assessments, but when money is needed to continue work, and it can't be got out of the mine, the only practical way is to levy an assessment. Of course, this has been done to death; but all good business practices are liable to abuse. Sometimes a mine is developed on the installment plan, the requisite funds being raised by a per capita monthly payment. A man can own 100 shares at a par value of $1 per share, and pay for them at the rate of 25 cents per share per month, but, practically, that amounts to a monthly assessment after all.

IN the case of the Puget Sound Machinery Depot vs. Rigby, arising over a contract for the manufacture of mining machinery, the Supreme Court of Washington decides: "A contract for the sale of a mining and pumping plant, to be manufactured in accordance with special specifications, which require the furnishing of special engines and pumps, connected by shafting specially fitted, the specially manufactured parts of which would be of little value except in connection with the plant, is not within the statute of frauds, requiring contracts to be in writing, etc., though the bulk of the plant was made up of articles purchased as merchandise by the seller from other parties."

FROM the Transvaal comes a taunting tale that will not set well with any Anglo-Saxon in any quarter of the globe. Discussion among some Boers as to the color of the English flag, some claiming it was red caused an old Boer to rise, and with placid mien assert it was white. Being told that was an absurdity, he said he had seen it three times; once at Majuba, once at Brunkerspruit, once at Doornkop. Each time it was hoisted; each time it was white. Each time the old fellow had gone to fight English troops and each time the only flag he had seen them wave was a white one. It is possible, however, that some day the old Boer may have a cause to change his opinion, which, from past events is certainly based on a logical line of reasoning.

H. A. LEE, Colorado's Commissioner of Mines, has commenced a suit in El Paso county against the owners of the Dillon mine, to enforce the regulations regarding mining which he recently promulgated, and to determine the extent of his authority. The complaint states that L. N. White, a mine inspector, gave the defendants notice that they were not working the Dillon mine on Battle mountain in a proper manner. The complaint alleges that the shaft is down 375 feet and there are no drifts and no ladders and no way to reach the surface excepting by the buckets. They also have a quantity of powder stored in the mine house near the boilers and machinery. Complaint alleges that the defendants have paid no attention to the warning of the mine inspector. An injunction has been issued restraining the defendants from working their property until the defects complained of are remedied, and a satisfactory showing made to the court.

ACCORDING to a Salt Lake, Utah, dispatch, the Gold & Silver Extraction Co. of America, which means the MacArthur-Forrest Co. in this country, has made a point in its royalty claims that is of material benefit to it. It will be remembered that over a year ago the Mercur, Utah, people refused to recognize the claim for royalty, and suit was brought by the company, a commission having been appointed and testimony taken with general reference to the rights of the company, both here and in England. The case against the Mercur was to come up this week, but on Thursday a compromise was effected. The Mercur people agree to pay the MacArthur-Forrest Co. $30,000 for royalties delinquent, and to pay royalty for the process in the future. Cyanide is an important factor in the working of the Mercur ore. In this connection it is of interest to note that the case of the MacArthur-Forrest Co. vs. some users of their cyanide process in Johannesburg, South Africa, is now in progress. It is understood that in this latter instance the company has partially withdrawn its claim to a patent on the use of zinc in the precipitation of the gold in solution.

COL. CHAS. SUTER, MAJ. C. L. B. DAVIS AND CAPT. C. E. GILLETTE last Monday received official notification from Gen. Craighill of their confirmation as members of the U. S. Debris Commission. Col. Suter succeeds Col. Mendell, Maj. Davis succeeds Lieut.-Col. Benyaurd, and Capt. Gillette, who has long been an active member of the commission, continues to perform the duties originally assigned to Maj. Heuer. Since the recent change in the personnel of the commission there has been an accumulation of applications, reports and other business. Capt. Gillette has been attending, so far as possible, to the routine duties of the office during the interregnum. Now that the commission has received formal notice of its appointment, there will be an immediate meeting of the board to pass upon applications, etc. The funds of the commission are very low, the original and only appropriation, made at the inception of the commission, having dwindled to about $200. However, Congress is in session, the regular appropriation bills are under way, and it is hoped that the important matter of appropriating requisite funds for the continuance of the commission will not be neglected.

## The Effect of Washing With Water Upon the Silver Chloride in Roasted Ore.*

[A Discussion of the Paper of Mr. WILLARD S. MORSE by L. D. GODSHALL, Everett, Wash.]

In Mr. Morse's interesting paper several statements occur which seem to require correction and comment. This is the more appropriate, since Mr. Morse has mentioned me by name, and has cited my "Review of the Russell Process," so that silence on part might be taken as indicating an assent which I cannot give.

On the first page of his paper Mr. Morse says that the "going-back" of chlorination was "the only difficulty encountered at Aspen," and adds that he has "never seen any explanation" of the cause. The plain inference is that he now fills this complete lack of an explanation by the hypothesis which he advances. I propose first to correct the statement of fact, and then to examine Mr. Morse's hypothesis and proofs.

An explanation on this point is advanced in Mr. Stetefeldt's book on "The Lixiviation of Silver Ores by Hyposulphite Solutions," to the effect that steam, generated by wetting the hot ore, might decompose the silver chloride, and leave as a result metallic silver, insoluble in hyposulphite of soda, but slowly soluble in Russell's solution.

Another explanation, suggested by Mr. Croasdale, the chemist of the company, and mentioned by me in my "Review," etc., cited by Mr. Morse, was, that the trouble was caused by the presence of ferrous sulphate. This was for a long time, I believe, the view of Mr. Morse himself.

Still another explanation was advanced by me in the paper referred to, and this is in fact mentioned by Mr. Morse, though he does me injustice by omitting from his summary of it the word "partly." My theory being that the variations noted are partly (not wholly, as Mr. Morse would lead the reader to infer) occasioned by the fact that there is present in the roasted ore a reducing agent, in the form of sulphurous acid, either free or combined, and that this agent, acting on the silver chloride, reduces it to metallic silver, insoluble in sodium hyposulphite, but slowly soluble in Russell's extra-solution.

It must be concluded that Mr. Morse meant to say that he had "seen no explanation" which was in his opinion satisfactory. That, of course, he had a right to say.

Mr. Morse further asserts that, while superintendent of the works, I "could devise no method to overcome the difficulty" which he declares to have been the only one encountered. On the contrary, I did devise and earnestly recommend a remedy, and I think I shall be able to show from Mr. Morse's own words that the failure to adopt this suggested remedy was the cause of the complete disaster which subsequently overtook the company after scarcely a year and a half of operation.

I must observe in passing, however, that the efficacy of a remedy is not necessarily dependent upon precise accuracy of theory as to the cause of trouble. For instance, the effect of reducing agents might be successfully counteracted even though those agents were not all correctly recognized.

Mr. Morse declares that, in his opinion, "the cause of the 'going-back' of chlorination is principally the presence in the roasted ore of sulphides of the base metals which have escaped oxidation in roasting; and in the case of the Aspen ores this result was due to the zinc sulphide, which, during the rapid roasting in the Stetefeldt furnace, did not have sufficient time to decompose." In other words, he lays the whole trouble to the Stetefeldt furnace; and it follows that if some other furnace had been used, which could have been so controlled as to continue the roasting until the zinc-blende had been decomposed, the remedy would have been at hand. This suggestion is advanced as novel, two years after the closing of the works. But while they were still in operation, I made in my "Review of the Russell Process" the following statement of the case:

> About the time the Aspen works were first started, the writer was informed by one of the leachers who had previously been connected with the leaching department of the Blue Bird mill in Montana, that much trouble had been experienced there on account of the water rendering a considerable portion of the silver chloride insoluble in the sodium hyposulphite solution. This water is used to dissolve and wash out the soluble chlorides of the base metals, and is called the first wash-water. The information was received with a smile of incredulity, but in a very short time it changed from a matter of amusement to a stern reality, as it was discovered that this same trouble existed to an alarming extent with the Aspen ores, as then mixed and roasted. A sample of the roasted ore charged into the vat would show a high extraction in the assay office with "hypo" or "ordinary" solution, as it is generally termed. At times the extraction by the "ordinary" would be almost as high as with the "extra" or Russell solution. But after washing the charge thoroughly with water and removing all soluble salts, and then again taking and leaching a sample, a vast difference would be found between the assay office "ordinary" and "extra" extraction. The "extra" extraction on the washed ore, as compared with the tests made on the dry ore, differed somewhat; but the "ordinary" extraction on the washed chloridized ore would sometimes fall as low as the "ordinary" extraction on the raw ore. Innumerable experiments were made to overcome this difficulty, and various theories were suggested as to the cause of it. Ferrous sulphate was at one time supposed to be responsible for the trouble, but repeated tests failed to show the presence of either soluble ferrous or ferric compounds. The theory proposed and still adhered to by the writer is that the variations noted are partly occasioned by the fact that there is present in the roasted ore a reducing agent in the form of sulphurous acid, either free or combined. This reducing agent, acting on the silver chloride, reduces it to metallic silver, insoluble in sodium hyposulphite, but slowly soluble in Russell's "extra" solution. This theory is strengthened by the fact that when a maximum amount of air was admitted into the furnace, thus oxidizing more of the sulphur in the furnace and allowing less sulphurous acid to be formed in the lower heat on the cooling floor, the difference between the "ordinary" extraction on the dry and washed ore samples was not so great as before. The difference in the extraction on the two samples by the "extra" solution was also less.
>
> As the pyrites used at this time contained quite a large percentage of zinc and lead in the form of blende and galena, it was thought possible that all the trouble might be traced to these impurities. This supposition seemed to be confirmed when, after the introduction of a purer pyrite, results were obtained which proved much more satisfactory; however, while the zinc and lead were responsible for the trouble to a great extent, they were so only in an indirect manner. It is a well-known fact that it is far more difficult to roast zinc-blende and galena than iron pyrites; consequently, when a large percentage of these minerals is present in the pyrites, more sulphur remains unoxidized in the ore after it has passed through the furnace, and the subsequent chloridizing action on the cooling floor, under a limited supply of air, necessarily produces a larger quantity of sulphurous acid.
>
> The irregularities mentioned are also indirectly due to the conditions that obtain in the Stetefeldt furnace. If it were possible to obtain a perfect chloridizing atmosphere, or oxidize all of the available sulphur in the ore while in the furnace, the difficulty with the washed ore would undoubtedly be overcome, as there would then be no reducing agent present to affect the silver chloride. Such a condition it is impossible to obtain in the Stetefeldt furnace when roasting ores carrying as much lime as the average ores of Aspen do. The question then arises whether such ores can be roasted better with any other furnace. Metallurgically, the answer is "Yes." The proof of the above assertion with regard to Aspen ores has been demonstrated by the writer by roasting in a reverberatory furnace ten lots of ore containing twenty-five per cent of CaO (MgO not determined, but probably amounting to ten to twelve per cent) with less than two per cent of sulphur, and using practically the same amount of salt as in the Stetefeldt furnace. The chloridization was all that could be desired, and no trouble was experienced with the washed ore.

It is evident that Mr. Morse agrees with my earlier statement in the following particulars: (1) That the trouble was caused by an incomplete roasting; (2) that this incomplete roasting was due to the action of the Stetefeldt furnace; (3) that it is impossible, with the Stetefeldt furnace, to roast properly such ores as were treated at Aspen; and I presume Mr. Morse will agree (4) that one remedy is to roast such ores in a furnace in which the sulphur can be thoroughly oxidized.

On the other hand, I do not admit that undecomposed zinc sulphide is the sole source of trouble; that sulphurous acid has nothing to do with it; or that Mr. Morse is the discoverer either of the cause or the remedy.

It will be observed that in my statement I mentioned zinc-blende (together with galena) as responsible for the trouble to a great extent; Mr. Morse, in support of his view that zinc-blende alone was the cause, says:

> No difficulty was experienced in roasting in the Stetefeldt furnace charges of ore containing from sixteen to eighteen per cent of iron pyrites (eight to nine per cent of sulphur), and completely oxidizing the sulphur.

This is not strictly accurate, even when the roasting in the Stetefeldt furnace is considered as including the subsequent heap roasting of from three to four days on the cooling floor; since, after such subsequent roasting, upon digging into the hot ore the smell of $SO_2$ was almost always noticeable, and frequently so strong as to annoy the workmen.

Mr. Morse says:

> The fact that the final apparent extraction of silver in the roasted ore was, by the use of the Russell solution, brought up to 86.74 per cent, or 7.82 per cent more than the amount shown to have been present in the roasted ore as chloride, proved conclusively that, whatever form the chloride had been converted into during the process of washing, it was soluble in the cuprous hyposulphite solutions of the Russell process. This led the writer to the conclusion that the silver chloride had been converted to a sulphide, which is really soluble in the Russell solution.

The force of this reasoning is not apparent. Assuming that this extra 7.82 per cent of silver was in the state of sulphide when dissolved (though there seems to be no proof of that except the fact that the sulphide is soluble in Russell solution) what is there to show that it had previously been a chloride? Mr. Morse's statement (confirmed by his tables) is that this silver was *not* present as chloride in the roasted ore before washing. How, then, can he suppose it to have been a chloride, and to have been altered to a sulphide by the reaction he describes? Why may it not have been a sulphide, or some one of the many other compounds of silver soluble in the Russell solution? In short, Mr. Morse's theory is clearly not applicable to this silver, which was not shown as chloride in the roasted ore. In other words the excess of 7.82 per cent, to which he refers, is not a result of any "going-back" of chlorination, and therefore, cannot offer any proof as to the cause of such "going-back." On the other hand, the figures which are pertinent to that discussion are those of the final column of his Table I, which it is therefore of interest to examine.

It will be noticed at a glance that a marked change occurs in the last column of this table, with the treatment of mixture No. 9. (Mixture No. 9, representing 2687 tons of ore, was the work of August. I left Aspen the first day of September.) In fact, the change should be evident in the line above, where, by a typographical error, the decrease of silver chloride by roasting is stated as 13.70 per cent, whereas, the subtraction performed upon the figures in the two preceding columns shows it to have been only 8.6 per cent. From this point down the column, ending with No. 19 (a period of nearly twelve months), the improvement and the uniformity of the results are (with two prominent and two lesser exceptions) quite out of proportion to the record preceding No. 8, and vastly greater than can be accounted for by the difference in the zinc sulphide of the ore. The explanation is simple, and will be given later. The fact is merely noted here, as throwing doubt at the beginning upon Mr. Morse's theory of the chief cause of "going-back."

A similar doubt is raised by a study of separate groups of the mixtures of Table I.*

I.—GROUP SHOWING PRACTICALLY THE SAME AMOUNT OF ZINC AS SULPHIDE IN THE ROASTED ORE.

| No. | Raw Ore in Mixture—Tons. | Total Ore in Group—Tons. | Zinc Sulphide in Roasted Ore. Per cent. | Decrease of Silver Chloride by Washing. Per cent. |
|---|---|---|---|---|
| 13 | 2380 | 6101 | 1.14 | 9.18 |
| 10 | 2656 | | 1.15 | 0.51 |
| 18 | 1065 | | 1.25 | 12.58 |
| 1 | 1309 | 5020 | 2.00 | 22.30 |
| 5 | 1276 | | 2.04 | 16.14 |
| 6 | 2435 | | 2.07 | 19.58 |
| 8 | 2123 | 4566 | 0.82 | 8.6 |
| 17 | 410 | | 0.89 | 4.0 |
| 24 | 2033 | | 0.97 | 0.24 |

Total amount of raw ore represented in the above set of groups, 15,687 tons.

II.—GROUP SHOWING PRACTICALLY NO VARIATION IN DECREASE OF SILVER CHLORIDE BY WASHING.

| No. | Raw Ore in Mixture—Tons. | Total Ore in Group—Tons. | Zinc Sulphide in Roasted Ore. Per cent. | Decrease of Silver Chloride by Washing. Per cent. |
|---|---|---|---|---|
| 12 | 2602 | 4982 | 1.64 | 9.66 |
| 13 | 2380 | | 1.14 | 9.18 |
| 11 | 2860 | 5574 | 0.68 | 3.18 |
| 9 | 2687 | | 1.00 | 3.32 |

Total amount of raw ore represented in the above set of groups, 10,529 tons: total in both sets, 26,216 tons.

In the first set of groups we would naturally expect to find, on Mr. Morse's theory, a uniform decrease of silver chloride by washing. The reverse is the case.

In the second set of groups, the decrease of silver chloride by washing being very uniform, we ought to find equal uniformity in the amount of zinc present as sulphide in the roasted ore; but the reverse is again the case.

The groups showing these discrepancies comprise 26,216 tons, or deducting No. 13, which has been used twice, 23,836 tons out of the 35,144 tons covered by Table I. I think it clear, therefore, that Mr. Morse's data do not support his theory; that is, they indicate some other cause, besides the precentage of zinc-blende in the ore, for the "going-back" of chlorination. The particulars of Mr. Hoyt's laboratory-experiments not being given, it is impossible to examine them critically.

With regard to the experiments of Mr. Frank A. Bird, the accuracy of which is unquestioned, it should be observed that the conditions were totally different from those at Aspen. In his experiments, from 55 to 58 per cent of zinc was present; in the Aspen ore, from 1 to 3 per cent.

The difference in the strength of the brine solution between the two cases is equally great. Moreover, for the months of May, June and July at Aspen, represented by mixtures No. 7 and 8, the percentage of salt in the ore (12.7 and 12.0 per cent) was the highest for the year, while the amount of silver chloride dissolved and extracted in July was 20.9 per cent, being exceeded by only one month during the year. The results of these lots as to decrease in silver chloride by washing do not conform with those deduced from Mr. Bird's experiment.

Table IV does not at all establish Mr. Morse's contention, unless he first proves that the extra silver, insoluble in "hypo" but soluble in the Russell solution, was present in the washed ore as a sulphide. Any one of the many other compounds of silver soluble in the Russell solution would answer equally well.

The direct cause of the remarkable change shown in Table I and beginning, as I have explained, with mixture No. 8, was the admission into the Stetefeldt furnace of all the air possible, thus oxidizing the

* Read at the Atlanta meeting of the American Institute of Mining Engineers, October, 1895.

* For this purpose, I use only twelve of the nineteen mixtures; my object in the re-arrangement being, not to deduce a general law, but to inquire whether the discrepancies which Mr. Morse considers "slight," and hence not contradictory of his theory, are really insignificant.

sulphur more completely in the furnace, and leaving less work to be done on the cooling floor, where the formation of much sulphurous acid is otherwise unavoidable.

As a further proof that the cause of the above change was known to me while at Aspen, I quote from "A Review of the Russell Process" as follows:

It was also noticed at Aspen that some of the lowest losses in silver were experienced during the months when a heavy excess of sulphur had been used and only a limited supply of air allowed to enter the furnace. It was afterwards observed that additional air produced a higher chloridization of the silver, but that the losses by volatilization were also higher.

On the action of oxygen in chloridizing-roasting, I may have something further to say in a subsequent paper.

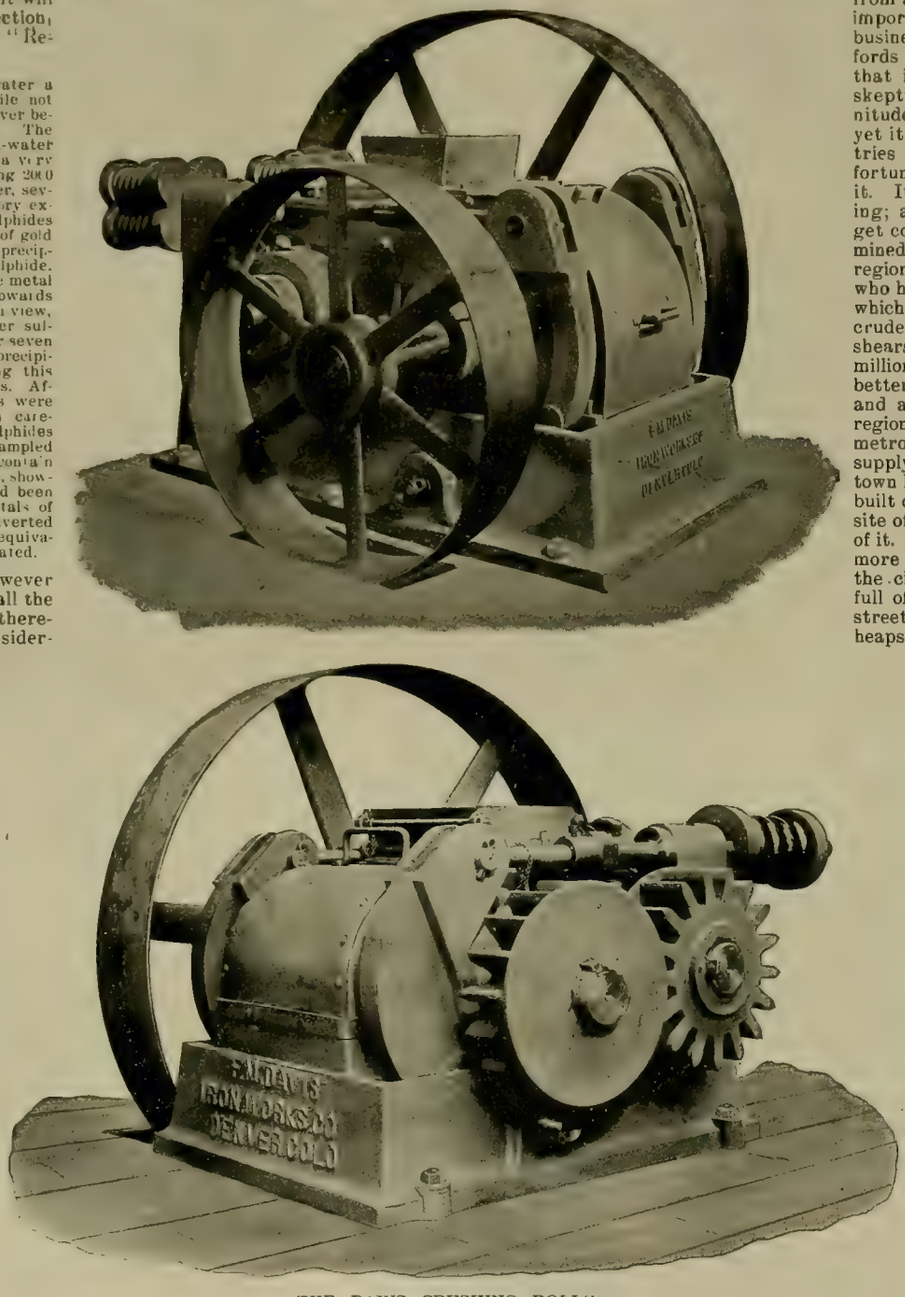
Speaking of the precipitation of the silver in the wash-water by means of precipitated base metal sulphides, Mr. Morse says, "The result of turning this reaction to practical account will be of interest." In this connection, I quote the following from my "Review of the Russell Process:"

In the precipitation of the wash-water a curious fact was noticed, which, while not new to chemistry, had probably never before been made use of in practice. The sulphides obtained from the wash-water containing the soluble salts were of a very low grade, frequently not extending 200 ounces of silver per ton. The writer, several years ago, made a few laboratory experiments with the precipitated sulphides of copper, lead and iron on chloride of gold solution, and found that all these precipitated the gold in the form of sulphide. Percy states that certain of the base metal sulphides act in a similar manner towards chloride of silver. With this idea in view, the tanks containing the wash-water sulphides were allowed to stand six or seven weeks before taking out any of the precipitates. All of the wash-water during this time was precipitated in these tanks. After each precipitation the sulphides were allowed to settle and the solution carefully decanted off. When the sulphides were finally taken out and dried, sampled and assayed, they were found to contain nearly 7000 ounces of silver to the ton, showing conclusively that a reaction had been going on by which part of the metals of base sulphides were gradually converted into soluble chlorides for which an equivalent amount of silver was precipitated.

The above precipitation, however carefully done, did not save all the silver, and the precipitation therefore was not complete. Considerable silver was saved from the decanted solution in a subsequent precipitation with scrap iron and other precipitants.

The mere questions of personal priority involved in the foregoing criticisms of Mr. Morse's paper have, of course, little importance. The real question, which we are both equally interested to answer, is, whether the theory he supports is sufficient to account for the facts, and whether the facts both sustain it and exclude any other. As to this question, I have frankly stated my dissent, and I do not feel that Mr. Morse has effectually either established his own view or overthrown mine.

### A Most Valuable Publication.



The following is a sample of several unsolicited and highly appreciated notices of this paper.

The MINING AND SCIENTIFIC PRESS is improving with age and the *Record* takes pleasure in saying that it to-day has the proud distinction of being by all odds the ablest newspaper representative of the mining interests published in the world. This is not flattery, but the plain, unvarnished truth. There are other mining journals in the country but none that in point of completeness and ability in every department can compare with the MINING AND SCIENTIFIC PRESS of San Francisco. People who reside in the mining districts should take this journal if they desire to keep posted on affairs transpiring in the mining world. The subscription is only $3 a year and we can truthfully say that it is worth many times that sum to any man who is seeking practical mining and scientific knowledge.—Amador, Cal., Record.

A NEW METAL composition, which is intended to serve as substitute for gold, has just been invented. It consists of ninety-four parts of copper and six parts of antimony. First the copper is melted and the antimony added afterwards. When the entire mass is in liquid condition some carbonate of magnesia and some carbonate of lime in equal parts are added, whereby the specific gravity is increased. The alloy thus produced has the color of gold and can be hammered and soldered like gold. Its color is not changed by nitric acid. This new metal can be produced for 25 cents a pound. Men in Oakland and elsewhere in the gold brick industry can find a probable profit therein.

### The Davis Crushing Rolls.

The two illustrations on this page are of the Davis Crushing Rolls, for which a patent has been applied, and which the inventor claims retain in their design all the good points of the original Cornish rolls, and embody improved details and new features. The frame of the rolls is of ample proportions, cast in one piece, this design being intended to insure perfect alignment of the journals, great strength and rigidity, require no separate foundation, and to dispense entirely with loose joints and their innumerable bolts and nuts. The bearings of the adjustable roll are carried by swinging arms, avoiding the excessive wear of the usual sliding bearings. The swinging arm is carried by and turns on a heavy steel eccentric pin, held firmly in its seat in the frame. The portion of the pin carrying the arm is eccentric with the part in the frame, and a partial revolution of the pin raises or lowers the swinging arm and bearing, providing a perfect vertical adjustment for the roll shaft—an important point in fine crushing rolls where it is absolutely necessary that the rolls should be exactly parallel to avoid side thrust in bearings and consequent loss of power. The shells are of open hearth steel. For longitudinal adjustment and wear there is placed on the roll shaft between each bearing and the center two or more steel rings. These can be changed from one side to the other, to shift roll as desired. The rolls are completely housed in, but are provided with covers, which can be taken off at any time. As usually constructed, the rolls are driven by a large, heavy band wheel on the stationary roll shaft, and a smaller wheel on the adjustable roll. When, however, from any local necessity, gears must be used, machines driven by gears are furnished. If desired, the rolls are built with feeder, which distributes the ore evenly over entire face of roll. These feeders are attached to the roll housing, as shown in engraving, and require no outside supports. These rolls are built in four sizes. The 12x12-inch rolls are generally used in sampling works and for this purpose are built with light steel housing, quickly removed by one man, giving free access to all parts of the machine for cleaning. It is also for the same reason provided with but one drive pulley, the adjustable roll being driven by small finger gears. These rolls are built by the F. M. Davis Iron Works, Denver, Col., who will answer all inquiries relative thereto.

THE DAVIS CRUSHING ROLLS.

### The Mining of Mica

Bakersville, western North Carolina, forty miles from any railroad, is the center of an important mining interest. The mica business is so commonplace and affords such small show of machinery that it is not unusual for one to be skeptical when told of its actual magnitude. It looks insignificant, and yet it is one of the greatest industries in that State, and has yielded fortunes to those engaged in running it. It requires no capital to set going; all that is needed is to own or get control of a deposit. It can be mined cheaply, as the labor of that region is low in price. The dealers who handle mica occupy little shacks, which are amply furnished with a crude work bench and a pair of shears. This is all that is needed; a million dollars would not secure a better outfit for the work. The wild and apparently worthless mountain region, of which Bakersville is the metropolis, is the main source of supply for the United States. The town looks as if it might have been built of mica, or else stands on the site of a ruined city that was erected of it. It can be seen scattered in more or less quantities all about the city and suburbs. The river is full of the shining particles, and the streets and alleys are strewn with heaps of the refuse. Its formation is like that of stone, and can be seen cropping out in cliffs.

In the granite, however, it seems to have taken great pride in making its fancied eternal home, but it has been disturbed by the volcanic eruptions of the earth in ages past, and now it is being surprised by the agencies of man. It can be found in all sorts of blocks of various thicknesses and shapes, and can be split and resplit almost ad infinitum, or until it becomes the thin, transparent, flexible wafer of commerce. It is imbedded in or scattered through the feldspar in blocks large and small, close together and far apart, and is blasted from the rocks with dynamite. The purer veins are found between walls of slate. It is taken from the mines to a little shop by means of various conveyances, from the shoulder of a native to the cart drawn by a bridled and harnessed steer. Here it is split into thin sheets, trimmed into regular shapes and is prepared for the market. The price varies with the size and color of the sheets. The Bakersville product is known to trade as rum mica. A two-by-four sheet, good, clear quality, is worth about 50 cents a pound, while ten-by-twelve will bring $4 to $6. Sheets of these dimensions are extra size, as the average is only about four-by-six. Rare sheets twenty-four by eighteen inches have been found. Occasionally a mine is found where the mica is too much scattered in the bedrock to make its operation profitable, hence there is a possibility of a man sinking a little money without the expected tenfold return; but generally the expert mountaineer can tell in a few shots whether there is any use of fooling with a bed or not. It is not an uncommon thing for a couple of natives to leave in the morning with a box of dynamite and return at night with $50 worth of mica. Blocks worth $200 have been found after a shot.

THE longest artificial water course in the world is the Bengal canal in India, nine hundred miles, the next is Erie, 363. Each cost nearly $10,000,000.

## Notes on Gold Milling in California.

NUMBER XVII.—CONCLUDED.

By E. B. PRESTON, M. E., Field Assistant State Mining Bureau.*

*Water Wheel Frames* are to be made of 12x12-inch lumber throughout, well anchored down to a stone foundation. That part of the frame which comes above the floor is to be dressed and painted the same as the battery frame.

The water wheels are to be housed with tongued and grooved lumber, 4 inches wide.

*Floors.*—Ore-house floors to be made of one thickness of 2-inch planks.

Battery, concentrator, and water wheel rooms floors are to be made of 1x8-inch lumber, double thickness, surfaced on top, to be supported on 3x6-inch joists 18 inches apart.

Sulphuret and cleanup rooms floors are to be made of concrete laid on top of a heavy wood floor, which is to be supported on foundations made of 8x8-inch timbers.

*Roofs.*—All roofs are to be made with 2x8-inch rafters 18 inches apart, with 1x6-inch board 4 inches apart, and covered with No. 26 standing seam, painted, iron roofing.

*Walls.*—All walls are to be covered with 1x10-inch rustic.

*Cornices.*—All cornices are to project 24 inches, measured horizontally from the walls of building, with a 12-inch frieze and a 5-inch facia made of dressed lumber.

*Windows.*—All windows, except those for sulphuret room, are to be made of twelve lights of 10x16-inch glass, and frames made to suit of dressed lumber, with casing outside 5 inches wide.

Twelve windows are to be put in the ore-house, seven windows in the battery room, six windows in the cleanup room, twelve windows in the sulphuret room, and five windows in the water wheel room.

*Skylights.*—Six skylights, made of twelve lights of 10x20-inch glass, to be put into the roof of the concentrator room.

*Doors.*—All doors, both sliding and swinging, to be 3x7 feet by 1¾ inches thick, with panels.

Two sliding doors are put in the orehouse, and one outside swinging door in the battery room; one swinging door leading from the battery room to the cleanup room; two sliding doors leading from the concentrator room to the sulphuret room; two outside sliding doors for the sulphuret room, and one outside swinging door for the water wheel room.

All doors to be set in good substantial casings, outside cased with surfaced lumber, and furnished with all trimmings and locks.

*Stairs.*—There is to be a flight of stairs at each end of the mill, one flight leading from the battery room floor to the floors above, and one flight of stairs from the battery room floor to the concentrator room floor.

All stair stringers to be made of 2x12-inch lumber, and treads of 2x10-inch lumber.

*Hand Rails* are to be put on to the outside of all stairs and around the landings of same, also in front of the battery room floor and all other floors and platforms where there is danger of falling. All to be made of dressed lumber, well painted.

*Retort House and Assay Office*, to be 20 feet wide by 48 feet long, with a retort and melting furnace room, a weighing room, and a storeroom; the two latter to be lath and plaster finished, and the whole building to be finished similar to the mill buildings, with iron roof, rustic, etc.

*Paint and Whitewash.*—All buildings are to be painted on the outside with a good coat of brown mineral paint, and the window and door casings and cornices to be painted with two coats of white lead paint.

The mill to be whitewashed throughout the inside, including the building frame, ore-bins, etc.

*Tanks.*—There are to be two 4,000-gallon redwood tanks, 3-inch stock, set up at the end of the mill upon strong timber foundation, and one tank 8 feet wide by 10 feet long by 4 feet high, inside measurements, to be made of 3-inch planks, with 8x8-inch frame; planking to be well fitted together, and properly caulked inside with oakum. The latter tank is to be set at the end of the last sluice-box coming out of the mill.

*Drain Boxes and Tailings Sluices.*—Battery sluices and aprons to be set on framework so arranged that the grade can be changed easily. This framework to be placed all over. Sluices and frames to be painted same as battery frame.

There will be a sluice in front of battery room floor, made of surfaced lumber; also to be painted and so arranged as to conduct any water away which drips from the floor.

There will be sluices put in under the concentrator room floor, two of which will be 6 inches wide by 8 inches deep, to run lengthwise to catch the tailings from the concentrators, and one to be 8 inches wide by 10 inches deep, to run crosswise and to take the tailings from the first two sluices, and conduct the same outside. All tailings sluices to have a fall of one in twelve, and to be made of 2-inch lumber, well fitted and nailed together. Proper sluices from the clean-up room, to conduct water and tailings therefrom, must be connected to tailings sluices under concentrator room.

All sulphuret boxes, and drain boxes for concentrators, to be made of good quality of redwood lumber, 1¼ inches thick, dressed on both sides, and well fitted and screwed together.

The weight of all parts is 240,000 lbs., and there are 325,000 feet of lumber in the building.

*Specifications for a Canvas Plant* are not considered necessary, as the construction is extremely simple and no standard has been adopted.

*Bulletin No. 6, California State Mining Bureau.

## Tersely and Truthfully Stated.

Two years ago, when six delegates were elected by the River Convention and instructed to proceed to Washington to work in the capacity of lobbyists for an appropriation for river improvement, other than that provided for in the Caminetti bill, the *Democrat* opposed their going.

Ex-Senator William Johnston of Sacramento and Hon. George Ohleyer were two of the delegates, and the sum of $300 was voted by the Sutter county Supervisors and a like sum by supervisors of this county to defray the expenses of the trip, but a protest was filed by a taxpayer of Yuba and the $300 was saved. They went to Washington and they came back, after having a good time at the expense of the people. Not one dollar of appropriation was received by the State as the result of the trip.

January 16th last, the River Convention again elected six delegates to go to Washington; at the same time a few members of the convention tried to commit the majority to the advocacy of the bill prepared by R. T. Devlin, known as the Sacramento River Commission bill. These delegates went to Washington, but Yuba and Sutter failed to respond to the call for $600 more for a junketing trip.

Delegate Johnston has returned to his home and Tuesday evening last he made a report to the Chamber of Commerce of Sacramento relative to his trip, they having paid $250 to defray his expenses. The gentleman frankly admitted that their trip had been a failure, in so far as obtaining an appropriation or a favorable consideration of the pet scheme of Mr. Devlin and the Anti-Debris Association. He was asked if the River Commission bill was favorably considered by the Committee on Rivers and Harbors, and he said it was not, because there already is one commission who have reported on the condition and requirements of the Sacramento and Feather rivers, and that the bill is dead. Thus we come back to the point for which the *Democrat* has contended from the first, and that is, money can only be obtained from the National treasury for river improvement on a report and recommendation of Government engineers appointed for that purpose.

And it will not be out of place to again remind readers of this journal that the report of the Biggs Commission, which was made nine years ago, is the only recommendation for an appropriation for the betterment of these rivers now before Congress.

Two years ago the *Democrat* said, if the bill of Congressman Caminetti then before Congress, based on that report, was defeated we would get nothing for river improvement, and now two years later we repeat that if the present bill asking for $250,000 and based on the report of the Biggs Commission is defeated we will get nothing for river improvements during this session.—Marysville Democrat.

COMPRESSED AIR as a power has displaced steam in three departments of the Pullman Palace Car Company's works, and the results have so far satisfied the officials that in all probability the new force will be used in all the great shops of the corporation. The change is radical and marks a revolution in the manufacturing system of the great Pullman plant. The argument advanced at Pullman in favor of a change from steam to compressed air, was, in short, a great saving in manual labor, economy, ability to transmit power long distances without loss of force, simplicity, safety and convenience. An official of the Pullman Company was sent to Omaha and Topeka to go through the shops of the Union Pacific and Santa Fe railroads and to make a report on the general efficiency and economy of compressed air as applied there in the department of car making. His report favors the adoption of the system throughout all the car shops at Pullman. With the air system it is claimed that the speed of the machinery in use may be graded, something that is impossible when a belt is used.

IN reviewing the German iron industry for 1895 a well known authority says: "The direct conversion of molten pig iron into steel, that is, the direct transmission of iron from the blast furnace to the converter without a second melting, was carried on everywhere with the best results. New plants have been erected which produce from the ores billets and slabs without using any other fuel in the steel making than the gases generated in the blast furnaces.

## Recent Additions to the State Mining Bureau Mineral Collection.

Mr. Henry S. Durden, of the State Mining Bureau Mineral Collection, reports the recent addition of the following specimens to the extensive collection. Visitors to this city will always find considerable of interest and value at the rooms of the State Mining Bureau, 24 Fourth street.

Gold quartz.—Said to assay $400 per ton. Golden Gate mine, near Sonora, Tuolumne county, California. Presented by the company.

Mine ladder.—Made and used about forty-five years ago by the Mexican miners in the New Almaden quicksilver mine, Santa Clara county, California. C. C. Derby.

Trona (native carbonate of sodium). Teel's Marsh, Esmeralda county, Nevada. F. M. Smith.

Auriferous arsenical pyrite, and auriferous vein matter.—"Soft Kidneys," largely clay, and usually rich in gold. Found in the Ackley vein of the Sierra Gold Company's mine, near Downieville, Sierra county, California. From the company

Gold quartz (Jaspery).—From the pay shoot of the Shenandoah mine, French Ravine, Plumas county, California. From the company. Assay sent with specimen: $15 per ton, free gold; sulphurets, $200 per ton.

Relief map of Sierra county, California.—Presented by the Sierra County Miners' Association, per H. W. Orear.

Macoma inquinata; Pisania fortis; Venericardia borealis; Crepidula grandis; Janira (vola) bella; Chrysodomus (siphonalia) kelleti.—All pliocene fossils. Rincon asphalt mine, Santa Barbara county, California.

Pectan expensus.—Dall. The first found north of San Diego.

Terrebratella occidentalis.—Dall. Pliocene fossils. Temescal canyon, near Santa Monica, Los Angeles county, California.

Shale.—Silicious; with small nodules of quartz and crystals of pyrite. Placerville, El Dorado county, California. Wm. Craddock.

Marble.—From the property of the Monterey Waterworks Company, near Monterey, Monterey county, California. Wm. Skinner, superintendent.

Auriferous argillaceous conglomerate, rich in free gold; showing gold in ferruginous seam; showing seam of copper ore occurring in the deposit, and which is rich in gold. Mt. Leyshon mine, Charters Towers, Queensland, Australia. From the company.

Feldspar (columnar).—Mt. St. Helena, near Kellogg, Napa county, California.

Aragonite (carbonate of calcium). — From near Healdsburg, Sonoma county, California. George Madeira.

Gold quartz, showing free gold.—Sandhurst, Victoria, Australia.

Gold quartz; silver ore; fluorite; auriferous gravel; tin ore (Cassiterite). Kinta, Perak. Perak Museum.

Ochre.—Yellow. From a deposit near Occidental, Sonoma county, California.

Copper ore.—Chalcopyrite. Bolinas mine, one mile east from Dogtown, on Bolinas bay, Marin county, California. J. W. Pierson.

Gold quartz.—Eclipse mine, one mile south from Alleghany, Sierra county, California. Appel & Grant.

Gold quartz.—Kosciusko mine, Consol., (formerly the original Quartz Hill mine), six miles northwest from Redding, on the road to Old Diggings, Shasta county, California.

Gold quartz.—Delta mine, Dog creek, five miles west of Delta, Shasta county, California. M. B. Butler.

Feldspar.—Orthoclase. Hildreth, Madera county, California.

Dihydrite (hydrous phosphate of copper).—Ehl, near Linz. Prussia, Germany; Eudidymite (silicate of glucinium and sodium).—Ovre-avo, Langesund Fiord, Norway; Forcherite (a variety of opal colored by orpiment).—Auvergne, France; Gahnite (zinc aluminate, zinc spinel).—Sterling Hill, Ogdensburg, New Jersey; Gigantolite (a variety of pinite, hydrous silicate of aluminum and potassium).—Tamela, Finland; Guaranite (silicate of titanium and calcium).—Monte Samma, Vesuvius, Italy; Hetaerolite (oxide of manganese and zinc).—Sterling Hill, Ogdensburg, New Jersey; Hiortdahlite (silicate of zirconium, calcium and sodium).—Mittelaro, Langesund Fiord, Norway; Inesite (hydrous silicate of manganese and calcium).—Jacobsberg, Sweden; Lillianite (sulphide of bismuth and lead).—Lillian mine, Printerboy Hill, Leadville, Colorado; Lithiophilite (phosphate of iron, manganese and lithium).—Branchville, Connecticut; Melanophlogite (silica and sulphur).—Giano mine, Racalmuto, Sicily; Nesquehonite (hydrous carbonate of magnesium).—Nesquehoning, near Landsford, Schuykill county, Pennsylvania; Rammelsbergite (diarsenide of nickel) —Freiberg, Saxony; Rectorite (silicate of alumina).—Garland county, Arkansas; Richterite (a variety of amphibole).—Langban, Sweden; Sarcolite (silicate of aluminum, calcium and sodium).—Monte Somma, Vesuvius, Italy; Seigenite (sulphide of nickel and cobalt).—Herz mountains, Germany; Strengite (hydrous phosphate of iron).—Eleonore mine, Geissen, Saxony; Turnerite (a variety of Monazite, phosphate of cerium, lanthanum, didymium, etc.).—Tavetsch, Switzerland; Vesbine, on lava of 1631.—Vesuvius, Italy; Uranothorite (silicate of uranium and thorium).—Brevig, Norway; Walpurgite (arsenate of bismuth and uranium).—Joachimsthal, Bohemia; Woodwardite (sulphate of copper and alumina).—Cornwall, England; Zunyite (silicate of aluminum).—Zuni mine, Anvil mountain, Silverton, Colorado; Gadolinite (silicate of yttrium, cerium and iron).—Bluffton, Llano county, Texas; Jordanite (sulph-arsenide of lead) in dolomite.—Imfeld, Bimenthal, Switzerland; Stilbite (hydrous silicate of aluminum and calcium).—Nova Scotia; Witherite and Bromlite (carbonate of barium and calcium).—Hexam, England; Erythrite (hydrous arsenate of cobalt).—Schneeberg, Saxony; Aragonite, crystallized (carbonate of calcium).—Frizington, Cumberland, England; Heulandite (hydrous silicate of aluminum and calcium).—Paterson, New Jersey; Chabazite and Heulandite (hydrous silicate of aluminum, calcium and potassium).—Nova Scotia; Apophyllite (hydrous silicate of calcium and potassium).—Guanajuato, Mexico; Gypsum (sulphate of calcium).—Grand Rapids, Michigan; Bowenite (a variety of serpentine).—Smithfield, Rhode Island. J. Z. Davis.

Gold quartz.—Tong mine, Clarksville, El Dorado county, California. Williams & Tong.

Gold quartz.—Lyons mine, Clarksville, El Dorado county, California. Charles Lyons.

Auriferous Steatite, assaying $39 per ton, free gold.—King Solomon mine, east fork of Trinity river, Trinity county, California. A. M. Delano.

Uraninite (oxide of uranium).—Portland, Connecticut.

Gold quartz, two specimens, extracted in 1895.—Doss mine, five miles south from Hornitos, Mariposa county, California.

Gold quartz, with traces of tellurium.—Old Judge mine, Pinon Blanco group, three miles north from Coulterville, Mariposa county, California.

Gold quartz, with arsenical pyrite.—Toledo mine, Tuttletown, Tuolumne county, California.

Gold quartz, two specimens, one from the surface and one from depth.—Caledonia mine, Potter ridge, five miles east from Gruh gulch, Madera county, California. The vein is in chlorite schist.

Talc Schist, with pyrite which shows the effect of a "shearing" movement in the vein, the crystals being displaced and contorted.—Gold Cliff mine, Angels, Calaveras county, California.

Slate.—Red. Willow Glen ranch, three miles northeast from Milton, Calaveras county, California.

Amphibole Rock.—Birney ranch, one and one-fourth miles northeast from Angels, Calaveras county, California.

Hornblende Porphyrite.—Birney ranch, one and one-fourth miles northeast from Angels, Calaveras county, California.

Quartzite.—St. Clair, Churchill county, Nevada. J. F. Halloran.

## Japanese Wages.

The following table, giving the average rate of wages obtained in different districts of Japan, as compiled by the Statistical Bureau of Japan, will afford the California workman much serious matter for reflection:

AVERAGE MONTHLY WAGES (WITHOUT FOOD).

| | Silver. | Approximate Value in U. S. Gold Coin. |
|---|---|---|
| Weavers, men | $4 83 | $2 56 |
| Weavers, women | 3 30 | 1 75 |
| Agriculturists, men | 2 31 | 1 22 |
| Agriculturists, women | 1 28 | 68 |
| Men servants | 2 12 | 1 12 |
| Woman servants | 1 16 | 61 |

# Electrical Progress.

## The Electric Locomotive.

The Westinghouse Electric and Manufacturing Company has received the first electric locomotive manufactured under the arrangement entered into some time ago between the Westinghouse Company and the Baldwin Locomotive Works of Philadelphia. In appearance the locomotive is much different from the steam locomotive, and it also shows radical departures in construction from every electric locomotive hitherto manufactured. It is 38 feet long and 9 feet across. All the operating parts of the locomotive have been placed on the truck and the body of the car will only contain the controlling apparatus, and can be utilized as a receptacle for such appliances as are usually carried by any train. It may also be used as a freight or baggage car.

One of the characteristic features of the locomotive is the truck, which has eight wheels and is constructed in a very substantial manner. The wheels are 42 inches in diameter. There will be four motors of 200 H. P. each connected to the axles of the locomotive. Thus the entire weight of the locomotive will be placed upon the truck, thereby becoming available for adhesion. This feature of construction will be recognized as a very advantageous one. The locomotive, completely equipped, will weigh 160,000 pounds. The motors are geared, which method has been decided upon so as to enable the company to use more efficient and durable motors, and also greatly reduce the cost of the locomotive. The Baldwin-Westinghouse combination is constructing engines for all kinds of purposes. The one described here is the regular passenger engine, rated at 1000 H. P. capacity. Then there will be locomotives made to be used in mines. The latter will have six driving wheels and the superstructure will consist of a sheet iron cab. The switching locomotives will also have a cab as a superstructure. There will also be manufactured locomotives for tunnel work, suburban traffic and rack locomotives, as well as for elevated railroads.

It is expected that within a few days the second locomotive, as completed by the Baldwin people, will be received at the East Pittsburg factory of the Westinghouse Electric and Manufacturing Company. This last one will be of the elevated railroad type and is an example of a motor car of the Manhattan Elevated Railroad of New York.

As far as the speed of these new locomotives is concerned, it may be stated that the motors have been geared to produce a speed of seventy-five miles an hour, although the builders think it may reach one hundred and twenty-five miles an hour, if it were demanded. All Westinghouse-Baldwin locomotives will be equipped with air brakes, which will be operated in the usual manner by an air pump, which is underneath the car, and which will be driven by an electric motor.

The Westinghouse-Baldwin locomotives have been designed so as to be utilized with any method of electric traction. They can be used with the trolley system, the third rail system, the Westinghouse electro-magnetic system, and they can also be utilized in connection with the Tesla polyphase system.

---

A CINCINNATI clothing manufacturer has invented an electrical machine for cutting cloth, which is capable of cutting 200 to 250 suits a day. A man can cut only about twenty-five suits and then only about four thicknesses of cloth, while the machine easily cuts eight layers. The machine is handsomely constructed and very light, weighing only thirty pounds, and is but fourteen inches high. The base is made of bronze and the armature is supported by a forged steel standard. The knife which does the cutting is about four inches in diameter and revolves with the rapidity of a buzz saw. The knife is protected with a guard. The machine is self-oiling, self-sharpening and self-lighting. It has a strength of one-eighth-horse power and is of 110 voltage. It is operated by a handle in the rear, and glides as easily as a flatiron. Electricity.

## Electricity Operating Mining Apparatus.

The operation of mining apparatus by electricity is daily growing more widespread, it being a question of outlay and resultant profits.

The General Electric Company has largely contributed to the bringing about of this result. Since it first entered the field it has kept steadily in view the improvement of its electrically operated mining apparatus and its adaptation to the peculiar conditions of the mining industry. The accompanying illustrations show a few examples of apparatus produced at its works and now in successful operation.

Fig. 1 shows a 6½x8-inch horizontal triplex pump, directly driven by a 10 H. P. four-pole slow-speed motor through two reduction gears, the entire combination on the same base, being mounted on a truck for ready transportation from place to place in the mine. The motor is controlled by a rheostat set at the side, and, like the motor, housed in with a sheet iron cover. The illustration shows the truck mounted on wooden base for shipment.

Fig. 2 shows a No. 4 Root blower driven by a four-pole slow-speed motor of fifteen H. P. capacity and mounted on a common base frame. Fig. 3 is a 60-inch steel plate exhaust fan operated by a two and one-half H. P. four-pole motor. The fan makes 480 revolutions per minute, and has a capacity of 8300 cubic feet of air per minute at three-quarter ounce pressure.

Another combination, introducing the multiphase motor for use on alternating current circuits, whether monocyclic or multiphase, is shown in Fig. 4, illustrating a triplex vertical single acting pump, directly connected to a 220-volt, sixty-cycle, ten H. P. multiphase motor. This type of motor developed by the same company, aside from its compactness, which allows of its erection in a restricted space, has the additional advantage of being absolutely without brushes, commutator or moving wires. These motors are now in use on all the three-phase monocyclic power transmission circuits in this country, operating without attention and without accident and to the entire satisfaction of the user.

FIG. 1.—ELECTRIC MOTOR DRIVING HORIZONTAL PUMP.

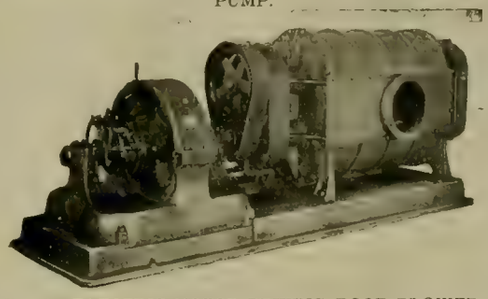


FIG. 2.—ELECTRIC MOTOR DRIVING ROOT BLOWER.

FIG. 3.—ELECTRIC MOTOR DRIVING 60-INCH EXHAUST FAN.

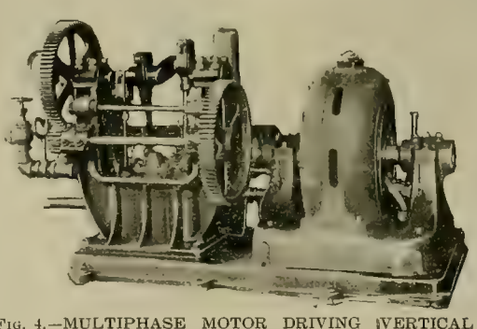

FIG. 4.—MULTIPHASE MOTOR DRIVING VERTICAL PUMP.

---

A USEFUL and compact portable electric-light plant has been designed for ship use. The engine and dynamo are mounted on separate frames provided with wheels so that the plant can at any moment be run into position on board, where it can be bolted to form a complete bed. In addition to the necessary terminals and connections for the cables to the projector and distribution boxes, which can be placed upon flats alongside a steamer, the plant is equipped with cargo shades. These shades, each of which is fitted with five 16-candle power lamps, are used in the embarking and disembarking of cargo, which can be carried on uninterruptedly through the night. The projector, which is used for navigating rivers, has a mirror 30 inches in diameter, and is provided with a hand lamp and dispersion lens to give a flat beam. It can be instantly run up to the bows of the ship when wanted. The plant, which is light as well as portable, is provided with a tarpaulin cover so that in bad weather it can be covered up. It is designed to run for long periods without attention.

A TROLLEY WHEEL which cannot jump off the wire has been invented by a Milwaukee street-car superintendent.

# Scientific Progress.

## Longitudinal Waves and the Roentgen Rays.

Dr. Oliver Lodge makes some interesting comments on the Roentgen rays. He is tentatively in favor of the theory that the Roentgen rays are longitudinal propagations of the ether. He thinks that what suggested longitudinal waves to Roentgen was the fact that crystalline properties were of no importance: *e. g.*, that Iceland spar and quartz were equally transparent or opaque whichever way one turns them. But it must be admitted that such a test as that is next door to none. "If tourmaline is transparent to Roentgen rays going along its axis, it would be a much better test; and this I have myself ascertained to be the fact. J. J. Thomson has also found that a pair of ordinary cut tourmalines are equally transparent whether their axes are "crossed" or parallel, which is an excellent test. Nothing suggestive of polarization in any form has yet been observed, a fact which tends against transverse and in favor of longitudinal waves. But the strongest argument in favor of longitudinal waves is derivable from the fact that the rays discharge electric bodies. Lenard found this, and J. J. Thomson and I have both obtained it easily under Roentgen-like conditions, but their peculiarity is that (unlike light) they discharge positive and negative about equally.

"Elster and Geitel showed that when polarized light discharges a really smooth surface it is most effective when the electric oscillation is partly normal, not tangential, to the surface; in other words, that it is what may be called the longitudinal or end-on component of ordinary light that is by far the most effective in discharging electricity.

"Mr. Robinson thinks he has observed that the same thing is true as regards the power of exciting fluorescence; an important observation, if true, but the examination is not complete yet. If it turns out so, then the two things that Roentgen rays are known to do are characteristic of end-on or normal vibration.

"As to photographic or radiographic action, it is so slow and inadequate at present that it hardly looks like a direct primary effect, but even there it seems as if thick films did better than thin.

"Another fact that gives a gravitational look to Roentgen's rays is the fact that they appear to pay more attention to specific gravity or ordinary density than to any other property of matter. This can be said without stating that opacity and density are strictly proportional. Any way, electrical properties of matter seem to be quite unimportant; polish or roughness, a coherent block or a powdered mass, are all the same to these waves, as they are to gravity.

"Direction of crystallization matters nothing, nor does shape; an aluminum prism cannot bend them; they cannot be bent, or even reflected to any considerable extent. If it be found that physical state is also unimportant, so that the same molecules obstruct equally, however they be aggregated, whether into solid, liquid or gas, that will be a further contribution to the evidence in the same direction.

"Lenard, Hertz, Goldstein, and the Germans generally (except Helmholtz—a notable exception!) have consistently urged that cathode rays were something more than a stream of particles; in case it should so turn out, Lenard urged this for his rays outside, in air. Hertz, I believe, urged it for rays inside the vacuum. It may be that the streaming particles are there, but the ethereal process may be also there. Outside in the Lenard rays both processes possibly coexist, one deflectible by a magnet, the other not. That both processes exist also inside the vacuum is not likely. J. J. Thomson has exposed a protected plate in the very rays themselves inside the vacuum and got no result. It looks as

if the streaming particles alone could not achieve it."

Dr. Lodge says, at the end of his comments: "If the sun emits any rays that can reach photographic plates through boxes or hand bags, even through black paper, every touring photographer should know; but if cathode rays alone have no direct action, without the intervention of a phosphorescent substance, then even the absence of direct solar action would constitute no valid and conclusive proof that the coronal rays are not electrical, though it would very much militate against a method of easily obtaining a photographic record of the corona, which has been suggested."

A YEAR ago attention was directed in this column to the prediction of an eminent authority that we were entering upon a period of scientific activity that would far transcend any previous experience. The most indifferent observer cannot fail to be amazed at the manner in which this prophecy is being fulfilled. Chemists are astonished to find that the long familiar atmosphere contains a large proportion of a substance hitherto unknown—the strange and inert argon; and helium, so long known in the spectrum of the sun, is discovered as a terrestrial element. With the liquefaction of air and hydrogen we are introduced to a new chemistry of cold. The development of the electric furnace brings great possibilities in the reduction of certain metals, and among its remarkable products yields calcium carbide, the source of acetylene, which is the first hydrocarbon to be produced artificially on a large scale, and a revolutionary achievement in chemical synthesis. Most surprising of all is the new form of radiant energy. Eager students everywhere have quickly begun experiments with the mysterious X rays, and the new art of "shadowgraphy" promises, among other things, that the sick can have their diseased organs brought to view, while the curious can have their skeletons photographed while they wait. Other epoch-making discoveries are almost grasped, and it is clear that, with so many roads opened to peaceful conquest, our end-of-the-century days leave no time for demoralizing wars over political boundaries. The war between Italy and Abyssinia and other conflicts have no such record of victories as those of science in the last year.

IF the total heat of the sun were valued at twenty million dollars, the proportion of its genial warmth utilized by the earth would be worth about one cent, says Sir Robert Ball, in *McClure's*. The balance of the sun's heat is wasted in space, so far as science knows. If all the coal in the earth were to be used for sun fuel, the heat produced would be only equal to that shed in the tenth part of a second by Old Sol. The great gaseous mass, which is larger than the moon's orbit, is burned up so that the great luminary is ten inches smaller each day than it was the day before.

THE "Roentgen waves" are still receiving universal attention. Prof. Sanford, of Leland Stanford Jr. University at Palo Alto, in this State, whose investigations on the same subject three years ago practically preceded the recent announcements, will lecture on the subject at the Academy of Sciences in this city on the evening of the 16th inst.

THE most recent observations and experiments go far toward justifying the belief that the light rays brought into prominence by Prof. Roentgen's experiments are longitudinal waves. If this be demonstrated, it will open a new department in natural physics of equal magnitude with sound or electricity.

THE article on calcium carbide and its manufacture in the issue of this paper of Feb. 1st has attracted considerable attention. Discussion on the commercial possibilities of acetylene is colored largely by the business standpoint. The statement of rivals who fear displacement of profits or the published opinions of those influenced thereby should have no weight with seekers after the facts, men who care more for the scientific progress and its practical dollars and cents results than the opposing claims of obsolete concerns who see their former profits fading.

## Mechanical Progress.

THESE estimates of the work obtained from one pound of coal at different epochs of steamship evolution are supplied by an address by Mr. A. J. McGinnis, as president of the Liverpool Engineering Society. In 1840 the consumption of fuel on an ocean steamer propelled a displacement weight of 0.578 ton eight knots, or an actual earning weight of 0.057 ton, the hull representing 40 per cent and the machinery and fuel 50 per cent of the displacement. In 1850, with iron vessels and the screw propeller, a displacement weight of 0.6 ton was propelled nine knots, but the earning weight was increased to 27 per cent, or 0.16 ton. In 1860, with higher boiler pressure and the surface condenser, a displacement weight of 0.82 ton was propelled ten knots, and the earning weight was 33 per cent, or 0.27 ton. In 1870 the compound engine so reduced the fuel carried that a displacement weight of 1.8 tons was propelled ten knots, the earning weight being 50 per cent, or 0.9 ton. In 1880, when passenger and cargo steamers had separated, the record of the purely cargo steamer was 2.1 displacement tons propelled ten knots, the net earning weight being 50 per cent, or 1.05 tons. In 1890, when steel hulls and triple expansion engines had become universal, the work on the cargo boat was 3.33 displacement tons, propelled ten knots, and the earning weight had risen to 58 per cent, or 1.93 tons. In 1895 there were two classes of cargo boats. The work on the ocean "tramp" was 3.4 displacement tons, propelled eight and one-half knots, with an earning weight of 60 per cent, or 2 tons; on the huge cargo vessels of the North Atlantic 3.14 tons propelled twelve knots, earning weight 55 per cent, or 1.7 tons. The express passenger steamers show more clearly the penalty of speed. On these the earning weight propelled for each pound of coal per hour was reduced from 0.16 ton in 1881 to 0.09 ton in 1895; while the increase of speed from nineteen to twenty-one and a quarter knots was obtained only by raising the daily coal consumption from 300 to 500 tons.

DISCUSSING the use of cyanide of potassium for steel-hardening purposes, T. R. Almond, Brooklyn, N. Y., suggests this salt assists the hardening process because of its powerful dioxidising properties, and also because it forms a liquid film on the surface of the steel, which causes a more perfect contact between the steel and the water, thereby permitting a more rapid abstraction of heat. The inevitable formation of a thin coat of oxide is unfavorable to the process of rapid cooling; and as rapid cooling seems to be the one thing necessary for success as to hardness, any means used for the removal of a bad conductor of heat, like the black oxide, will be of advantage, and more especially if this means also results in the formation of a liquid film on the steel surface having the affinity for water which, it is well known, is peculiar to potassium cyanide. Mr. Almond recommends the removal of all scale or oxide from the surfaces of steel to be hardened, either by pickling or by the cyanide. Steel, covered with a very thin film of oxide, will take the heat less quickly when immersed in hot lead than if the steel be bright before being immersed. This being the case, it would seem to follow that, because of a film of oxide, heat will leave steel more slowly when being cooled by water.

CITY ELECTRICIAN BARRETT has solved the question of new power for bridges spanning the Chicago river. An electrical plant is to be installed at a central point, and not only are the bridge circuits to be extended, but the generators will provide 400 additional sixteen-candle power lamps for municipal use.

ONE might be accused of romancing were he to assert that a gun is of several million H. P., and yet nothing is more exact. The 100-ton gun, with a 550-pound charge of powder, throws a projectile weighing 2020 pounds at an initial velocity of 1715 feet per second. It communicates to it, therefore, a live power or kinetic force of 92,597,000 foot pounds. The thrust exerted by the gases due to the ignition of the powder lasts less than a hundredth of a second. The result is that during the active period of the work of the powder in the gun the mean power is greater than 87,000,000 foot pounds per hundredth of a second, say 8,700,000,000 foot pounds per second. This represents a power of 12,000,000 kilowatts, or 17,000,000 H. P. There is, unfortunately, another side to this picture. Although large guns are extraordinarily powerful, their active life is essentially ephemeral, since, after a hundred shots, they are generally out of service. They have then worked actively one second! The same calculation applied to modern guns that throw 2200-pound projectiles, and communicate thereto an initial velocity of 1970 feet a second, demonstrates, further, that such guns, during less than a hundredth of a second each time, develop a formidable power of 13,050,000,000 foot pounds per second, say 24,000,000 H. P.

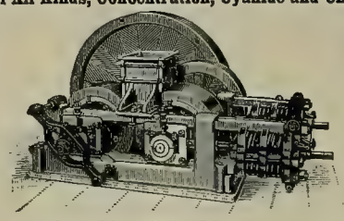
THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS

AND FOR USE IN

Milling and Mining Machinery
Reduction and Concentrating Works
Woolen, Cotton, Paper and Pulp Mills
Rice, Flour and Cottonseed Oil Mills
Sugar and Malt Houses
Distilleries, Filter Presses
Stone, Coal and Ore Screens
Stamp Battery Screens
Brick and Tile Works, Filters
Spark Arresters, Gas and Water Works
Oil, Gas and Vapor Stoves
Coffee Machinery, etc., etc.



Standard Sizes Perforated Tin and Brass Always in Stock.

Main Office and Works: 222 to 240 North Union Street, Chicago, Ill., U.S.A.
Eastern Office: No. 284 Pearl Street, New York

ESTABLISHED 1860. COLORADO IRON WORKS INCORPORATED 1878.
MANUFACTURERS AND BUILDERS OF
Smelting Plants of All Kinds, Concentration, Cyanide and Chlorination Plants.

Stamp Mills, Cornish Rolls, Roasting Furnaces, Hydraulic Sizers, Etc.

WESTERN AGENTS FOR ERIE CITY IRON WORKS ENGINES AND BOILERS.

Improved form of Crushing Rolls.

Crushers, Sampling Mills, Screens and Elevators, Sample Grinders, Etc.

WESTERN AGENTS FOR SMITH-VAILE STEAM PUMPS For all kinds of service.

Our stock of supplies for Mines, Mills and Smelters is complete and we are prepared to fill orders on shortest possible notice.
We have an ore testing plant in connection with our works and we test ore in car lots for concentration and amalgamation, and build mills to successfully treat all classes of ores by latest known methods.
OFFICE AND WORKS, 33D AND WYNKOOP STS., DENVER, COLO.

ORES! ORES!

Gold, Silver and Lead Ores and Concentrates

PURCHASED AT REDUCED RATES FOR TREATMENT.

Consign shipments to Vallejo Junction, Cal.

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

Mining Property Wanted at Once.

TWO COPPER MINES.
TWO QUARTZ MINES—Dividend Payers.
ONE MANGANESE.

J. F. CROSSETT,
628 SACRAMENTO ST., SAN FRANCISCO.

FOR SALE.

Complete plant for mining on an economical scale, including hoisting, pumping and drilling machinery, tools, etc. Near railroad station in central California. Address,

BOX M,
Mining and Scientific Press Office.

HYDRAULIC MINING

By the HYDRAULIC GRAVEL ELEVATOR SYSTEM a Specialty.
Examinations and Reports of Mining Properties made.
Catalogues of HYDRAULIC MINING MACHINERY and Circulars explanatory of the HYDRAULIC GRAVEL ELEVATOR SYSTEM furnished upon application.

R. H. CAMPBELL,
602 Market St., Crocker Bldg., San Francisco.

DIAMOND DRILL
FOR SALE.

1 Sullivan Hand Prospecting Drill, size M, with full equipment; also extra Carbons and 250-foot Drill Rods, little used and guaranteed in first-class order. Will sell cheap.

NIAGARA MINING COMPANY,
French Gulch, Cal.

# Practical Information.

### All-Round Work.

There is great advantage in division of labor; but this advantage has been overestimated. Specialties in employment have been pursued to such an extent that it is hard to find a man who is proficient in every branch of his business, or the business of his firm, shop or factory. The legitimate fruit of this exaggerated estimate is the crank, the dissipated workman, out of sorts with his work and hence with himself and everything else. To stand in one spot the whole day long, and day after day, tending a machine that does nothing but shape a tack or head a pin, narrows and dwarfs a man, till, like the crank of an engine, he is ready to elbow everyone that comes in his way. Such men are good subjects for communism and anarchy.

It takes all-round work to make an all-round man. Manual training, as a branch of education, is giving a new view of labor—each occupation valued according to the degree of discipline or education it will afford mind or eye. The symmetrical development of the muscular system is becoming a matter of much consideration, and is giving many valuable suggestions touching the development of mind. All-round work is seen to yield better results in character, as well as in constitution. God is not mocked. He never intended a man to be a mere machine, even if he can make a—so-called—living at it.

### A Chemical Detective.

A Budapest manufacturer has informed the police that he possesses a powder with which thieves can be caught. Having recently made the unpleasant discovery that his cash-box was plundered day after day, and failing in all his attempts to catch the thief, he applied in his dilemma to Mr. Telek, professor of chemistry at the Franzstadt Commercial Schools, and the latter gave him a powder which he sprinkled over his cash every night before leaving the office. This powder has the peculiar effect of dyeing the skin blue, the color being intensified by washing, while it resists the application of soap. On the very first day the manufacturer noticed a deficiency of eight crowns in the silver cash-box. He at once called his employes together and ordered them one by one to steep their hands in a basin full of water, got ready for the purpose. One of the men was very loth to follow the example of his comrades. At last he consented, when no sooner had he dipped his hands in the bowl than they turned dark blue. His employer stepped up to him and said, "You are the thief!" and the man confessed.

A CURIOUS FACT is the impossibility of moving your eye while examining the reflection of that organ in a mirror. It is really the most movable part of the face; yet if you hold your head fixed and try to move your eye while watching it, you cannot do it—even the one-thousandth of an inch. Of course, if you look at the reflection of the nose, or any other part of the face, your eye must move to see it. But the strange thing is that the moment you endeavor to perceive the motion the eye is fixed. This is one of the reasons why a person's expression as seen by himself in a glass is quite different from what it is when seen by others.

EXPERIMENTS are reported as having been made abroad lately on the self-ignition of cotton waste. A handful of cotton waste was dipped into linseed oil, squeezed out, placed in a wooden box, and the temperature observed closely by means of a thermometer introduced into the box; the temperature surrounding the box was kept at 70° C., and, in a short time after, the temperature in the box was found to have risen to the height of 173°, and smoke issued therefrom. Then, when opened to admit air, a flame burst out at once, while a box from which the air was perfectly excluded consumed after five or six hours. In another experiment, in which the cotton was saturated with rapeseed oil, the box burned after ten hours. With an outer temperature of 56°, gallipoli oil caused the spontaneous combustion of cotton wrapped in paper; castor oil required twenty-four hours; sperm oil, four hours; train oil, two hours, for a lively combustion.

A NEW DETERMINATION of the lowest temperature at which a hot body becomes visible is published by Signor Pettinelli, in the *Nuovo Cimento*. He heated a cast-iron cylinder 30 cm. long and 14 cm. broad, in a wrought-iron jacket over a bunsen burner to a temperature of 460° C., as indicated by an air thermometer, and then observed its flat end in a dark room from a point 60 cm. above it. When it had cooled to about 415° the red heat vanished and gave away to an indefinite hazy glow. This glow completely disappeared at 404° and repeated observations gave an error of only 3°. High emissive substances, such as the mantles made by Auer and others for incandescent gas lighting, became visible at the same temperature, but reflecting surfaces had to be heated 20° higher before they appeared to the eye, and glass still more. These low temperature rays were found to traverse glass and water like ordinary light rays, but they suffer a comparatively greater absorption. Different eyes differ slightly in their capacity for seeing them, the maximum divergence being about 6°. But the extent of surface must be the same. Signor Pettinelli found that if he screened off all but one-fortieth of the surface, the body had to be heated 6° higher than before to become visible.

THE word "fad" is a manufactured word, not given by Worcester. It has been in use only a short time, comparatively, and while it may be derived from the Welsh it is more probable that it is made from the initial letters of the words "for a day." The word "tip" originated in that way. In an old-time English tavern a receptacle for small coin was placed in a conspicuous place over which appeared the legend, "To insure promptness." Whatever was placed in the box was given to the servants. Other taverns followed the example, and soon the three words were written "T. I. P.," everybody knowing what they indicated. Then the punctuation marks were dropped, and the word "tip" was born. "Fad" and "tip" are of the same class and kind.

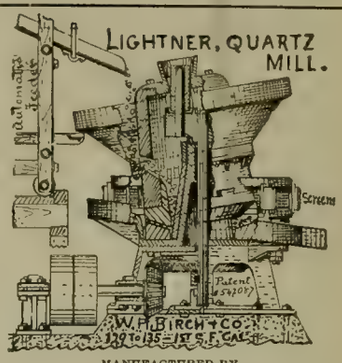
CLEMENS HERSCHEL, hydraulic engineer, isn't worrying about the "destruction" of Niagara Falls. The Niagara Power Company is now using enough water to make 30,000-horse power. Suppose in the next 65 years the drain of this company and of other compainies should equal 400,000-horse power, "then," says engineer Herschel, "the flow of the Niagara river in 1960 would be reduced from 265,000 cubic feet per second down to 238,334 cubic feet per second; the depth of the water on the American Fall from four feet down to 3.74, and the depth of the water on the Horseshoe Fall from 14 feet down to 13.08 feet." In other words, visitors wouldn't learn from their eyes that any water had been taken from the river at all.

IT often happens that destructive fires break out in great factories almost immediately after the night watchman has made his rounds. The general inspector of the Hartford Fire Insurance Company thinks that the fault is not so much with the men as the system. He proposes this change: He would have two watchmen, each employed part of the day at other work. One would serve from noon until midnight, and the other from midnight until noon. This would cost no more than the present plan, but would lessen the risk from sleepiness, he thinks.

*Printers' Ink* of New York recently gave a list of papers in the United States over fifty years old, and accredited to California the following papers, with the date of first publication:

| *Paper.* | *Year.* |
|---|---|
| Marysville *Appeal* | 1831 |
| Sacramento *Bee* | 1824 |
| Sacramento *Record-Union* | 1828 |
| San Francisco *Bulletin* | 1819 |
| San Jose *Herald* | 1844 |

The true dates of first publication of the above papers are:



| *Paper.* | *Year.* |
|---|---|
| Marysville *Appeal* | 1860 |
| Sacramento *Bee* | 1857 |
| Sacramento *Record-Union* | 1851 |
| San Francisco *Bulletin* | 1855 |
| San Jose *Herald* | 1851 |

SOME interesting facts were developed by Prof. Ranke at the last meeting of the German Anthropological Society, in relation to the relative weights of the brain and spinal cord in man. It is well known that man has not the heaviest brain of any animal; the whale and the elephant have heavier. Nor has he the heaviest in proportion to his weight; some singing birds, various small apes and the mole have proportionately heavier brains. What Ranke brings out is that the weight of the human brain is much greater in proportion to the weight of the spinal cord than in any other vertebrate; and this, therefore, constitutes an anatomical distinction of man, strongly contrasting him with all other animal forms.

ESTABLISHED 1860.

DEWEY & CO.
Patent Agents,
220 MARKET ST.,
SAN FRANCISCO.
Reliable Advice.

"CRACK PROOF"
PURE RUBBER BOOTS
Are the CHEAPEST because
They are the Most Durable.

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
Local Manager for U. S., F. CLERICI.

RUPTURE CURED.
Dr. J. C. Anthony, of 86 and 87 Chronicle Building, who for the past four years has met with universal success in the cure of Ruptures, now guarantees a cure in from 10 to 16 days. There is no pain, no blood drawn and absolutely without danger. Usually but a single treatment required.

# Mining Summary.

Judge McKenna's ruling in the U. S. District Court this week in the North Bloomfield case, which virtually upholds the constitutionality of the Caminetti act, is in effect a notice to the Anti-Debris Association that it has no excuse for existence, and that the money paid to its salaried officials is not for value received, as all authority in the matter vests in the U. S. Debris Commission and the U. S. Courts. This ought to be good news to the taxpayers in the counties whose Boards of Supervisors pay out county funds to gentlemen who alone find profit in maintaining the organization. Meanwhile, the officers of the California Miners' Association, with the real good of the miner and farmer at heart, work gratis for the cause, without pay or hope of reward beyond the approval of their fellow citizens—and defray their own expenses.

## CALIFORNIA.

### Amador.

*Record:* At the Gwin mine, when they pass through the ledge it is the intention of Superintendent F. F. Thomas to put in a charge of dynamite to break through the formation and secure a drainage for the whole works. The work of boring is done at the surface and no men are in the shaft while work is in progress, this precaution being taken to avoid the endangering of life in case the confined waters of the old works should break into the new. The depth of the bored hole at the present time is near where the surveys locate the old 1400-foot level, and if, according to the theories of many miners familiar with such matters, a large volume of water is confined in the old works, the condensed air held in many of the chambers would cause instant death to any living thing with which it came in contact, and the water, if freed by any operations in the new works, would instantly flood them.

At the Oneida the temporary plant has been completed and the work of sinking the shaft is now progressing with eight-hour shifts. They are employing eighteen men and pay miners $3 per day. The shaft is to be sunk 1000 feet with the present hoisting plant, and in the interim one will be erected which will sink to 3000 feet. They will then go down 800 feet more, making the shaft 1800 feet in depth, at which point their surveys give them the ledge. The work is being prosecuted under the management of E. Ross Browne for the English Exploration Company of London.

The *Republican* reports that the Lowry gravel claim at Aqueduct, which has been in shape for active working by Meehan & Mattly, has been bonded to McIntosh, a San Jose man. The price is $12,000; $2000 has been deposited as a forfeit, the purchaser to have the privilege of testing the mine by a run of sixty days. In the event of the output averaging $40 per day, he to pay the balance of the purchase price at the expiration of that period.

The new Oneida shaft is down about sixty feet.

The Kennedy chlorination works commenced roasting ore on the 1st instant, with six months' work ahead.

### Butte.

MINES ABOUT ENTERPRISE.—The North Star mine, owned by Bothwell, is working four or five men on two stamps.

At the Burroughs mine two arrastras are running. The tunnel is in 60 feet, and the ledge is 4 feet wide.

At the E. W. mine a tunnel is being run in to connect with their shaft, which is down over 100 feet on the ledge. Alm and Slater have run a tunnel 130 feet on the ledge which averages 5 feet in width. They are running two stamps at present and will put up five during the summer. They also own the Crystal Hill mine about two miles distant from the Crystal Peak. The tunnel is in about 264 feet and has tapped the ledge which at this point is about 2 feet in width, the shaft is down on the ledge 225 feet. They have a four-stamp mill on this mine, which will start up in about two weeks.

### Calaveras.

At Thorpe mine on the west side of the mother lode, one mile east of Fourth Crossing, at the 300-foot level crosscutting shows the chute about 14 feet wide: the shaft is over 440 feet deep. At 500 feet a crosscut will be run at the 400-foot level: if the ledge between the 300 and 500-foot levels proves to be as rich and permanent as at the 300-foot, a mill will be built.

P. E. Condit of Murphys, has bonded the Collier, Deer Lodge and West Extension mines, Stanislaus mining district, to T. C. Cox of Columbia for eighteen months for $28,000. By June 11, '96, $5000 must be paid on the Deer Lodge and West Extension, and $2500 on the Collier mine; on Nov. 28th, $6500 more must be paid on the two first named and $3750 on the Collier, on August 28th, 1897, the remaining $10,250 must be paid.

The Falcon near Murphys is again to start up. The 150-shaft will be sunk 200 feet deeper.

At the Rose Rock, on Indian creek, the shaft is 100 feet deep with a width of nearly 3 feet of quartz containing free gold.

### El Dorado.

(Special Correspondence).—The Grand Victory has opened a rich ore body on the 250 level.

In the Larkin the south drift has reached 90 feet, and the north drift 35 feet, showing a fair-sized ledge of satisfactory quality of ore. Steam pump and hoist are being placed this week.

The strike in the Lady Emma last week is of value. This property is six miles north of Placerville.

Bonding and incipient development work in various portions of the county are progressing to a degree indicating great prosperity in the mining interests of this county.

The Lone Star, four miles south of Placerville, under bond to D. H. Jackson and some San Francisco and Fresno people, has a tunnel 125 feet, showing a good ledge of fair ore. The tunnel will be extended 600 feet into the hill. Work was begun last week.

The Big tunnel is progressing through the hill toward the Gentle Annie at a fair pace.

The ore body struck on the 300 level of the Gentle Annie last week was an agreeable surprise to its owners. The vein measures 10 feet.

John Melton has bonded a drift mine to A. A. McDonald at Grizzly Flat. A tunnel 500 feet is yielding good profit.

Placerville, Cal., March 10.

### Madera.

*Gazette:* Grub Gulch is about thirty miles east of Mariposa.

The Mammoth mine is about half a mile from the town. It has a large electrical power plant, driven by the Fresno river, and a ten-stamp mill. The mill has been shut down for a year, after running steadily for six or eight months. The Starlight is also owned by the Mammoth Co. Charles Ward is manager. There is a shaft down about 340 feet, with an 8-foot vein in the bottom of it. The Riverside is another location of the same company, and next comes the Beaumont, with a tunnel in 250 feet. The Mammoth Co. is making preparations now to start work on its properties on a scale of considerable magnitude. The Spencer ten-stamp mill is now about starting up. It is driven by electrical power. In its immediate vicinity are Swain's locations, the Savannah, French Gulch and the Joe mines. The Savannah has two shafts down 150 and 180 feet, respectively.

The Caledonia & Ward mine is just starting to work. It is close to the Mammoth and is the property of a newly incorporated company, of which Mr. Hawke is the superintendent. There is a tunnel in about 140 feet and one of the owners is at present in San Francisco arranging for machinery. Six men men are at work here and the property ought soon to make a good showing.

The Victoria mine is about four miles from Grub Gulch, and Charles Ward, the superintendent, has a force of men at work. The ten-stamp mill and electrical power from the Mammoth are to be removed to the Victoria shortly.

The Sierra Butte mine was located four years ago by Louis Grosjean, and has four men at work on it. There is a shaft down 120 feet on a vein running from 20 inches to 2 feet. The work has hitherto been mostly done by parties doing the assessment, and they have done considerably better than making wages at it. Mr. Grosjean now contemplates work on a more extensive scale and has gone out to the property with that object.

Grub Gulch is a live little camp and everyone connected with it is very sanguine at present. Wages are $3 per day for miners and $2.50 for men on top.

### Mono.

THE ERIE TUNNEL.—Col. Dyer has organized a company to prosecute work in the Erie tunnel, at Lundy, and to run a tunnel to intersect the Bryant ledge, in Lake canyon, at considerable depth. It will be about 800 feet long.

### Nevada.

The Orient Gold Placer Mining Company of North San Juan has levied an assessment of 50 cents per share, delinquent March 31st.

The Bullion Consolidated Mining Company of Grass Valley has levied an assessment of 20 cents per share, delinquent April 13th.

The *Transcript* reports a strike at the Mt. George mine last Saturday, while making a crosscut from the main ledge about 50 feet below the surface. The main ledge is between 6 and 8 feet wide at a depth of 200 feet.

The *Tidings* hears that the Last Chance Company are again ready to start their mill. The Last Chance is the old IXL, up in God's country. At the California mine in the same district the new tunnel is in now about 600 feet. The company have averaged 22½ feet per day in this tunnel. The stockholders of the German mine, near Washington, have received $10,000 from parties who recently secured a bond on the property. The amount is the first installment of $30,000 to be paid for the property. Dana Harmon is at the head of the company which has the bond.

*Union:* A new three-compartment shaft will be sunk on the Williams ranch by the Providence company. The work will be begun soon.

### Placer.

*Sentinel:* The river claim of the Erie Mining Company is on Bear river, two miles from Colfax, and consists of 3000 feet of the channel of Bear river above the dam across the river which furnishes water for the South Yuba Water Company's lower canal. The dam holds back tailings of an average depth of twenty feet for several thousand feet up the channel of the river. The company will run a bedrock tunnel from below to tap the gravel at one side and under the dam and work its gravel through the tunnel under the dam. The gravel in this property came from the rich hydraulic mines of You Bet, Little York, Gold Run and Dutch Flat. Part of the gravel in those large claims was cemented, and the fact that it has lain exposed to the elements for many years would cause it to decompose and liberate the gold.

Chapman Bros. and Leary have bonded the Green mine, Ophir district, and have begun development work.

At Sailor Canyon gravel mine additional working force will be put on as soon as sufficient ground is put in order by crosscuts and gangways, now being run to make room for them. The company sent in 1000 feet of air pipe and a blower last week.

The Schippman Company has its tunnel going and expects to reach the channel in early spring.

Preparations are being made to start work in the Bald Mountain mine.

The Herman mine and mill are running full time. A shipment of $5200 was made for last month's run. The company intends placing an additional ten stamps in its mill this season.

### San Benito.

At the New Idra mines near Hollister, two fine furnaces, one for coarse ore and one for fine ore, will soon be built. Mr. Holmes is superintendent. To dispense with hauling ore from the mines to the reduction works a tramway has been built.

### Riverside.

At Perris the Santa Rosa mine was attached and the Good Hope closed down, forty men being thrown out of employment at one mine and thirty at another, with no assurance of an early resumption of work in either.

The Santa Rosa mine has filed a petition in insolvency. The liabilities amount to $18,904.53; the assets to $108,414.57. The assets consist of three mines and new machinery, valued at $25,000.

The closing of these mines is the outgrowth of litigation, and in no sense reflects upon their value.

### Shasta.

*Searchlight:* Four men are engaged on the Eureka Tellurium in getting out ore, which will be taken to the smelter at Keswick. The expensive works designed to treat tellurium ore have been idle for some time. Development work, however, has been continued on a small scale.

The first blast in the Keswick smelter has proved a success. Copper matte has been produced and considerable ore has been brought down from the mine for like treatment.

*Journal:* Culver & Co. are sinking a shaft at the mouth of Barkhouse creek. They will have to sink about forty feet before reaching bedrock.

The Distlehorst Mining Co. is getting its dredger ready and expects to revolutionize river mining in that section.

There have been an unusually large amount of location notices filed this year, and there is almost a certainty of trouble over some of them, as the same ground is covered in some instances by different locations.

The miners along the Klamath river have not started up yet, but they are busy making preparations and everything along the river will soon be booming.

The Seattle Mining Co., on Thompson creek near Seiad, has shipped a sawmill to Yreka. The company intends constructing a flume for conveying water to its hydraulic mine, and the mill will be used to saw the lumber required.

*Free Press:* The prospective litigation between owners of the Windy Camp or Balla Klallala group of mines on the Iron mountain range has been settled, and the mines are virtually sold to Colonel Cleary, representing Eastern and foreign capital.

At Keswick there is a quantity of ore for the smelter. The engine, with eight and ten cars, has made four trips altogether, but at present it is in Sacramento undergoing repairs. The furnace has been charged several times, and the managers appear well pleased with its work. Copper matte has been produced and the results are satisfactory.

### Sierra.

At Gibsonville 110 men are now working at the Thistle shaft.

NEAR SIERRA CITY.—*Enterprise:* Fourteen men are working in the Sierra Buttes mine. Quartz is run from No. 3 tunnel and sluiced down the ravine into the mill.

The Buttes Saddle Company employ seventeen men. No. 3 tunnel, when completed, will tap the ore chutes with 650 feet backing. One of the ore chutes is 95 feet long and the other 140. The pay chimney averages about five feet in thickness and is in contact with slate and porphyry—slate on the foot and porphyry on the hanging wall. A second ledge has been recently struck about fifteen feet in the hanging wall. An upraise was made of 140 feet above No. 2 tunnel and the ledge found to be nine feet thick. Quartz averages $5 to $8 a ton. The ten-stamp mill is run by a Pelton wheel, propelled by about 300 feet pressure of water. Samuel Miller, formerly of Port Wine, is superintendent.

### Siskiyou.

At French Creek, Supt. Dillon tells the *Reporter* at the Monarch mine they have run ninety feet on the pay chute, which varies from three to seven feet in width, and the rock averages from $6 to $9 per ton.

Mr. Atkinson, one of the owners, is here to buy an electric plant, a quartz mill and other machinery necessary to open up the property.

A gravity tramway one-half mile long will be built from the mine on the hill down to the stamp mill to be erected on French creek.

On the upper ledge, known as the French Creek mine, an incline has been sunk twenty-three feet. This ledge is four feet thick, and the assay value of the ore is $16.95 per ton.

### Tuolumne.

Sonora *Banner:* Laughlin and Poyger, of San Francisco, have bonded the Climax mine, near Jacksonville, and have begun operations upon it. They have held a bond on the Homestake, an adjoining property, for some time and the development done thereon has given satisfaction.

## NEVADA.

### WASHOE COUNTY.

The Seg. Belcher and Mides Consolidated Mining Company has levied an assessment of 10 cents per share, delinquent April 13th.

The Coon Mountain Consolidated Gold Mining Company has incorporated at Reno to mine in Del Norte county, Cal., capital stock $2,000,000. The incorporators are all Chicago men with one exception from Oakland, Cal.

### LINCOLN COUNTY.

The DeLamar *Lode* says the cable of the tramway from the De Lamar mill to the Jim Crow tunnel parted and the break necessitated the closing down of the mill.

## OREGON.

### BAKER COUNTY.

F. and E. Thompson and C. M. Foster have sold to the Exploring Syndicate of Mines and Mining in the United States—head office, Paris; N. E. Inhaus, manager, E. L. Giroux of Baker City, resident agent,—several placer claims on Burnt river, below Bridgeport.

### JOSEPHINE COUNTY.

The difficulties that have embarrassed the management of the Black Channel Company to develop in the placer mines on Foot's creek, near Gold Hill, have been settled as far as Manager Bouse and the miners are concerned, by the former turning over to the latter who are represented by Hammersley, Neff and Walroth the lease of the property. By the terms of the agreement the miners are to continue work on the property until they shall have paid off, in addition to the current working expenses, the back amounts due which aggregate about $35,000. Nearly $10,000 has been spent in developing the property by the Bouse company and the claim is said to be rich and in such a condition that it can be quickly realized from.

THE WALDO SMELTER. — *Mining Journal:* Capt. Geo. F. Wheeler has returned from the Waldo copper mines and the blowing-in of the smelter. The results of the preliminary run were satisfactory. About 300 pounds of copper, 96 per cent fine, were run through, and he brought back with him and now has in the office of the Elmer-Brown Company, in this city, 150 pounds of the product as a testimonial to the value of the ore and the success of the smelter. He regards all uncertain factors in the problem, if there ever were any, as eliminated, and within a week the copper bars will be coming into Grant's Pass in a steady stream for shipment East. The only obstacle met in this preliminary run was the lack of iron for fluxing. Near to the chief copper ledge lies an immense deposit of what has heretofore been considered iron, and it was from this deposit that the company expected to get its iron for fluxing; but, on trial in the smelter, it was found that the deposit contained, in fact, more copper than iron and was unfit for flux. Of course, the company does not regret this discovery, as the deposit thus becomes very valuable; but iron for fluxing will have to be obtained elsewhere.

## BRITISH COLUMBIA.

PILOT BAY. — The Kootenay Mining & Smelting Co. is about to erect works to refine its own bullion.

The Cariboo Hydraulic Company have decided to increase their capitalization from $300,000 to $500,000. A new ditch to cost $60,000 will be made this season. This mine will make a good showing this season, probably, an output of $200,000, but the output will be more than doubled evey year for some years yet to come.

Ashcroft *Journal:* The Quesnelle River Hydraulic Gold Mining Company will be worked on a large scale the coming season. J. B. McLaren, the principal owner, has, it is reported, raised $60,000 of English capital to develop the property and put a proper supply of water on the ground.

The Le Roi Mining and Smelting Co. paid a dividend of 5 cents a share, $25,000, on the 4th, being the third dividend of the company, the first for $25,000, the second for $50,000, and the present one of $25,000, making a total of $100,000 paid within the past few months.

## ALASKA.

The Silver Queen mine, on Sheep creek, in the Berner bay district, is thought to be a continuation of the vein on which is located the Comet mine, which, during February, with but ten stamps running, yielded $38,000. A tunnel 280 feet long has been run, and two ore veins have been encountered.

IMPROVED MAIL SERVICE. — The Alaska Steamship Company has been notified that the Government has awarded to it the contract for carrying closed mails two round trips a month between Seattle and Mary Island, Fort Wrangel and Juneau, Alaska. This service will begin with the next sailing of the Willapa, and with two trips by the Pacific Coast Steamship Company's boats, provides for four round trips a month under contract, besides additional trips by the extra boats run by the Pacific Coast Steamship Company. Early last fall Second Assistant Postmaster-General Wilson foresaw the necessity for increased facilities this season, and he gave instructions that the railway mail service give especial attention to the needs of that section. Already substantial improvements have been made. Proposals have been asked for carrying additional mails between Sitka and Juneau, giving four trips a month each way between those points. Service has already been agranged between Nutchek and the portage, to take effect when a postoffice shall have been established at Cook's Inlet, and there is no doubt that as soon as a postoffice shall have been authorized at Circle City Mr. Wilson will take prompt measures to provide a supply for it.

The Juneau *Mining Record* says: It will be a stand-off between the Yukon and Cook's Inlet this spring as to which receives the largest rush. The Yukon is an old stand-by and a country of known wealth in yellow nuggets; Cook's Inlet is a new field, with its wealth in placer ground yet undetermined. The inlet is more easy of access than the Yukon and living is cheaper and the working

season longer, hence cheaper gravel can be worked at the same profits

### IDAHO.

(Special Correspondence.) Winter is past for this section, and placer mining operations are resumed. Some of the mines are now in full operation Men are arriving daily who own placer properties in the camp. Quartz mining operations are proceeding as usual. The Idaho mine is improving as development proceeds. Ore from the face of drifts assays $30 per ton; but the majority of it is refractory, concentrating 7.40 per cent to the ton. Owing to the change in the ore, the mill has been closed down till the necessary alterations can be made The ore roasts very easily, and heap roasting frees the majority of its contents. The mill on the Idaho is unique, inasmuch as it was built on the property from the raw material iron and wood, and consequently it is more adapted to strictly free milling ore than to ore having as large a percentage of concentrates as the Idaho at present carries, but as it is, it is a monument to the industry of the owners who built it, being as they were without capital.

The Crescent Gold Mining and Milling Company are running as usual with two shifts in the mine. A recent strike in the camp is the richest yet found, pan tests showing as high as $1 a pound. The ledge is about three feet wide, with an ore streak about eight inches wide, which runs at least $500 a ton The owners are not desirous of making the the location of this bonanza public till they make further locations, and ascertain the true trend of the vein. At present the vein runs northeast and southwest, dipping to the east. Work is being rapidly pushed ahead with a force of four men. Gold is visible all over the rock, and the ledge appears to be well defined. It is located under the name of the Golden Reward, and it is owned by men who are well known in the camp, and it will either be made a producer or a hole in the ground.

Pierce City, March 1, '96.

COEUR D'ALENE OUTPUT.—At present the amount of concentrates being produced monthly is approximately as follows: Bunker Hill and Sullivan, 2100 tons; Standard, 2000; Hunter, 800; Morning, 1100; Helena and Frisco, 1500; Emma and Last Chance, 1200; Tiger and Poorman, 1100; Stemwinder, 250; Gem, 1000; total, 11,050 tons.

F. W. Bradley, superintendent of the Bunker Hill and Sullivan mine, says: "There is no longer any talk of labor troubles in the Cœur d'Alenes. The day has gone. Times are getting better all the time, the men appear to be well satisfied, and the feeling of unrest that for so long a time pervaded the country has given place to one of confidence in the affairs of the country. Affairs are looking brighter in the Cœur d'Alenes than they have for a long time before."

A Boise dispatch reports a rich strike in the Black Hornet mine. Work was recently started up on the property, with a view of furnishing ore to fill a 2000-ton contract, disclosing a body of high-grade ore over the tunnel level, near the point where the tunnel intersected the vein, which is five feet thick.

### UTAH.

*Tribune*: If an option was obtained by an English syndicate on the stock of the Centennial-Eureka last Saturday was successfully carried out, the property will, on or before the expiration of four months, change hands, the purchasers paying for it $3,000,000. The deal was manipulated by a St. Louisan, his contract obligates him to pay $100 for every one of the 30,000 shares, that have to date earned $1,580,000 and which are now earning at the rate of $2 a month per share.

Taylor and Brunton of Salt Lake will build a sampler at Park City. The capacity will be 400 tons daily. At present the firm is constructing a sampler at Cripple Creek, Col., with a capacity of 400 tons.

PARK CITY.—*Patriot*: Saturday is pay-day at the Silver King. On that date about $25,000 of the needful will be distributed among as clever an army of miners as ever worked underneath the ground. The poor stockholders will be kindly remembered on that day also. Their rations amount to $37,500.

### MONTANA.

Shipments from the Anaconda for 1895 aggregate 99,775,294 pounds fine copper, 5,470,860 ounces fine silver and 20,229 ounces fine gold. Of this there was of electrolytically refined copper to a total of 21,052,994 pounds.

All the property of the Butte & Boston Mining Company was attached last week on a suit for $406,516.43 brought against the company by Edward C. Perkins of Boston, the company's Eastern attorney and assignee of parties holding the company's floating indebtedness. The claims assigned to Perkins are as follows: Lewisohn Bros., of New York, $174,000; Boston and Montana Mining Company, $104,000; Lewisohn Bros. $40,000; Massachusetts Loan and Trust Company, $33,700; Globe National Bank of Boston, $10,000; A. S. Bigelow, $44,816.43. The property attached consists of thirty-eight mining claims, town lots, water rights, etc. It is claimed the attachments will consume the entire property, and that the bondholders and stockholders will receive nothing. The company's stock possesses a nominal value of $3.25 a share. Last July it sold at $28, the value in the aggregate has shrunk from $5,600,000 to $650,000. At the same time the value of the bonds must have shrunk fully 50 per cent, or from $2,500,000 to $1,250,000. There have recently been but forty men at work in the Butte & Boston mines, as it was found impracticable with the means at hand to hoist ore and do development work at the same time. There is perhaps three months' supply of ore in the east end of the Silver Bow mine, but the 9th, 10th and 11th levels running to the west in the long part of the mine are all in ironstone. On the 9th level the drift has gone 1,400 feet through a mass of rock assaying about 50 to 60 per cent in iron, and practically nothing in copper Similar iron stone has been gone through before in the Montana mines, but never has an iron horse of such size been encountered before.

It is believed by the Butte & Boston people, says the *Inter-Mountain*, that it is only a question of time when the Butte & Boston mining property will show up better, but it will take money to make the development work. The Butte & Boston is very largely in the condition of a man who has purchased a palace, exhausted all his means, and hasn't a cent left to buy a door mat. The Butte & Boston has a valuable smelting plant, but has never had the proper amount of money for mineral development work, as the floating debt has pressed the company ever since its organization

Although about 300 miners have been discharged the men left will keep the pumps at work, and the smelter will run for some time as formerly. The experiment will be tried of putting the Butte & Boston smelter upon Boston & Montana Colusa tailings.

The Butte & Boston has more than thirty mining claims, and in mineral ground has superficial area of about twice the area of Boston & Montana, but scarcely one-tenth of it has has ever been opened.

It is possible that a plan of reorganization assessing Butte & Boston stock may be devised to relieve the company of its embarrassment and the heavier the assessment the greater will be the future value of the property. At least $1,000,000 must be raised, and if $2,000,000 should be raised it would be far better; and there is no reason why every dollar expended upon this property, if the amount raised is sufficiently large, should not yield many more dollars in the future.

One thing is clearly certain from a study of the Butte & Boston property; and that is, that the mineral lands, aside from a smelter costing $750,000 are worth more than the debt of the company.

The Bozeman mine at Pony, Madison county, is bonded to J. M. Merell of Oakland, Cal., J. F. Cowan and P. A. Gamer of Butte, and J. S. Rooney of Pony for $30,000. A cash payment of $5000 has been made.

The Iron Mountain Company of Clancy has paid its thirty-third regular dividend. The report is as follows: Delayed ore sales for shipments in December, $7044.43; ore sales for January to date, $19,155.19; electric light sales, $16; eight cars shipped in January, unpaid for Feb. 13th, $26,215.62; current expenses for January, $17,623.76; net profit, $8591.91; balance on hand, $14,158.89.

### SOUTH DAKOTA.

Keystone *Miner*: The Keystone and Bullion mines are now closely associated, having been connected by a tramway between the lower tunnel on the Bullion and the Keystone hoist. This tramway is now completed and ten stamps of the Keystone mill will be dropping on Bullion ore. This ore, mined from the open cut on the summit of Bullion Hill, is not touched by hand or shovel and is put in the mill with as little expense as any ore ever mined; two miners supplying ore for both the Keystone and custom mills. Seventeen men are now employed in reopening the Keystone mine, and the mill is being supplied with perhaps as good ore as ever came out of the mine.

The new machinery for the Holy Terror arrived last week and has been put in place. The lot included a safety steel cage, a mortar and battery of stamps, two jigs, a slime table, a wagon scale and four ore cars. The stamps and concentrators have been placed in position in the mill; the cage was placed in the shaft and the work of sinking was begun. The men work three eight-hour shifts and employ two machine drills; the rock is hoisted in large iron buckets attached to the bottom of the cage. As the shaft is not on the ledge, of course nothing can be known of the new developments until the ledge is tapped at the 275-foot level and drifts started, but the indications above are that the rich ore chutes are larger than those above.

### MICHIGAN.

At the Calumet and Hecla copper mine, which has paid in dividends $44,850,000, the average thickness of the vein is about sixteen feet. It is made up of water-worn pebbles of all sizes, between which are angular rock fragments, the whole being cemented together by silica and calc. The copper occupies the places between these pebbles, and has replaced material that has decomposed. In point of richness, an average of something like 4½ per cent is obtained. There is a great variance in the percentage held from one level to another. They have opened many levels from which mining is being done, the work of development being well ahead, but they are taking the upper levels as fast as convenient, and are letting the hanging come down, for come down it will no matter what pains or means are taken to support it, and then there is no use in keeping it up after the copper-bearing rock has been extracted. The heaviest timbers are crushed, as the hanging is loose and treacherous, and shows great weight soon after a level has been finished.

### COLORADO.

The Newhouse tunnel, in the Cripple Creek district, has reached about 4750 feet. It is being driven to reach the mines of Seaton mountain, Russell gulch and Nevadaville at a greater depth, and giving them drainage and transportation, thus saving hoisting and hauling. The tunnel is 12 feet square.

The Victor *Review* says: The Nellie V, on Squaw mountain, recently shipped a car of ore that returned $128 per ton. The Lucky Gus was sold yesterday by Furman & Ferris for $15,000. This property is located on Squaw mountain and consists of one shaft of 25 feet. The ore assays $12.50 per ton. The shipments of the Portland Co. are again being brought up the average, having been reduced of late owing to the Anna Lee disaster and the many improvements being made. The big machinery, amounting to seven carloads, has arrived. The engine alone weighs 22,000 pounds, the largest ever brought into the State, and is accompanied with a guarantee to hoist 10,000 pounds 4000 feet in one minute. The Burns will be sunk 4000 feet or deeper, and will cut seven already known veins.

Denver *News*: The most important sale made in Gilpin county for some time past was that just consummated by Forbes Ricard of Central City and W. W. Williams of Russell Gulch to James McKay of Pittsburg, Pa. They sold him the Niagara mine. The consideration was $75,000, of which $25,000 was paid in cash for possession. The Niagara has been worked for the past twenty years, and has a record of many thousand dollars of production with comparatively small tonnage. It has in the past few months produced ore of a remarkably high grade, and shipments have averaged from two and two thirds to nine ounces in gold to the ton in carload lots.

Cripple Creek *Times*: The Mt. Rosa & Battle Mountain Tunnel Co. has started work on its big tunnel scheme, which is to bore under the townsite of Victor. The company is a strong one and shows its good faith by putting one-half of its two million capitalization into the treasury for development purposes. The tunnel course is direct toward the richest portions of Battle mountain.

### ARIZONA.

Miss Jennie Hilton of Pomona, Cal., has sold her share in the Kansas mine, in the Harqua Hala region, for $35,000, and has got $20,000 cash down, with promissory notes and mortgage for the remaining $15,000, payable in sixty days. Miss Hilton is a perfect type of the new woman in modern affairs. She is probably the only woman engaged in active mining operations in the United States, and it is likely there is no other woman anywhere who is a mining prospector in the full sense of the word.

The Phœnix *Republican* declares that Messrs. E. B. Gage, F. M. Murphy and N. K. Fairbank, owners of the Congress gold mine, have recently refused $2,000,000 cash offered by an English syndicate for their property. "Preparations are being made to supplement the present forty-stamp mill with another forty-stamp outfit. A cyanide plant will also be added to have a capacity of 200 tons daily to handle the total output of both mills. Work in the lower levels is being pushed as far as practicable to make connections with upper workings for a complete new ventilator." Work is now carried on at the 1400 foot level.

The Pearce mines near Tombstone are being developed. The superintendent talks of putting in a short railroad to connect with the Southern Pacific railroad to facilitate transportation of supplies and material to be used in the new mill, which will have a capacity of 150 tons daily.

A Scotch syndicate says it will in the next ninety days build a smelter at or near Benson to compete with the El Paso smelter, and for local customers, the capacity to be 500 tons daily.

A Chicago and Cleveland company will this week accept or reject several copper properties near Wickenburg. If accepted, a smelter having a capacity of 100 tons daily will be erected.

The *Republican* says that S. D. Kempton is in Phœnix from Vulture, where he is running ten of the stamps of the mill and working forty men. There is 150 feet of water in the shafts, which will supply batteries till summer. He has diverted channels of dry watercourses to fill up old workings of the mine when rain comes, and thus create a water storage.

THE FORTUNA MINE.—O. C. Perkins has been helping build a twenty-stamp mill at the La Fortuna, on the desert, thirty miles east of Yuma, sixteen miles from water, making that liquid worth $3 a barrel at the mine. A pipe line will soon extend from a well and near the Gila to the mine. Eight wells were dug before a satisfactory supply of water was found. The pipe line is extended now to within six miles of the camp. There will then be enough to supply the camp and stamp mill. The lead is from twenty to twenty-five feet wide, regular in its size. Those familiar with the claim say it will average $35 the entire width of free-milling gold ore. Much work has already been done. The shaft is 203 feet deep with crosscuts, showing the deposit of mineral is uniform.

### LOWER CALIFORNIA.

JACALITOS MINES.—F. K. McNamara, has gone to Jacalitos, Lower California, where he will assume charge of the Piedad group of mines, recently purchased by G. H. Hayes and H. A. Howard. A five-stamp mill is being sent to the mines, with facilities for easily enlarging the battery to ten stamps, which it is expected will be done within a few weeks. E. Ibarra is putting in a Bryan mill. At Zaragoza, a few miles from Jacalitos, G. Lombard is putting in a stamp mill.

### SOUTH AMERICA.

PLAYA DE ORO MINING COMPANY.—Under date of Feb. 27th J. D. Baucus, treasurer of the company, says R. F. Lord, formerly manager and chief engineer, has no longer any official connection with the company. A partial cleanup at Boqueron mine was made on February 12th and 221 ounces of gold obtained —a cleanup from the sluice boxes, no attempt being made to cleanup the bedrock, as the gravel bank on which they are washing at the Boqueron mine is now over eighty feet high, and caves or slides easily. "These slides, which are frequent and extend forward from 50 to 100 feet, almost entirely cover the exposed bedrock, making it dangerous for the workmen to cleanup until the bank has been washed back for a considerable distance beyond the present line. When this is done, a cleanup of the bedrock can be made and the heavier gold which it contains will then be obtained. The miners estimate that at least three times as much gold will be found on the bedrock as has been obtained from the sluice boxes. With the money on hand and the bullion in transit we will have sufficient funds to complete the improvements and changes in the plant recommended by Mr. Petty, which will secure a permanent supply of water, according to his statement, at the Boqueron mine of 1500 inches, as against 250 inches, which has been the average amount available up to this time, and the head of the water will be increased from 70 to 165 feet, which will largely increase the efficiency of the giants and enable at least 30 per cent more gravel to be washed with the same amount of water. It is estimated by Mr. Petty that this additional water will be available in from sixty to nine days –in fact, from February 22nd, on which date the 'feeder' canal was to be completed, he states we can count upon having a permanent supply of water of 700 miners' inches, and this amount will be gradually increased by the 'feeders' and storage reservoirs which are in progress of construction."

Mr. Blodgett, acting superintendent, in his last report states: "The most noticeable thing about the bank (Boqueron) during the week was that a large number of the ancient Incas tunnels were exposed. The greater part of these tunnels were driven close to the bedrock, but some have been encountered as much as twenty-five feet above it, well up in the main body of gravel. Several of these high tunnels were in perfect condition, while most of those lower down were filled or partly filled with rock. Those that are entirely filled up are perfectly distinct, as the gravel with which they are filled is thoroughly oxidized and of a bright red color, while the surrounding gravel is of a deep blue. Since beginning operations here, probably not less than 100 of these ancient tunnels have been encountered and though they will no doubt materially affect the cleanup, until the work has been advanced beyond their primitive operations, I regard the presence of these tunnels as the best proof in the world of the richness of the bank, for even in the old days of fabulous wealth and splendor of the Incas, the mine now known as Boqueron was deemed well worth working."

## Commercial Paragraphs.

THE new drilling plant on the 750-foot level of the Occidental mine, at Virginia, Nevada, is a Phœnix drill, a Rix air compressor, and a Daniel Best 14 H. P. crude oil engine.

THE Krogh M'f'g Co. is completing one of the largest drainage plants in the State on Sutter island, in the Sacramento river. The island is entirely surrounded by a levee, and will be kept dry by a Krogh centrifugal pump with a capacity of 30,000 gallons per minute.

UNDER date of Feb. 20th, the Vulcan Iron Works of this city is in receipt of a letter from Secretary A. T. Cerbus of the Alaska Treadwell Gold Mining Co., which says: "Our double circular sawmill, of about 20,000 feet daily capacity, for which you made plans and built the machinery complete, including a set of three 6-inch beam Vulcan head blocks, 60-inch opening, has given us complete satisfaction in every respect;" illustrative of the general satisfaction expressed by all who use the sawmills built by the Vulcan Iron Works.

THE Denver Engineering Works are devoting considerable attention to electrical mining machinery. They are now working on a large electric hoist for Aspen, Col., three electric hoists and complete lighting plant for Mexico and two electric pumps with a capacity of 1000 gallons per minute. They are also working on orders for several high-speed automatic steam engines, as their new "'96" design is considered equal to anything manufactured in this line for workmanship, style and duty, and is being recognized as a high-class, economical engine.

TWO CARLOADS OF MACHINERY for a ten stamp gold mill plant complete have just been shipped by the Colorado Iron Works to the Negociacion Minera y Beneficiadora de Santiago y Anexas, in the district of Tlalpiyahua, old Mexico. One 100 H. P. stationary boiler, together with several tons of wrought-iron pump bob straps for Cornish pump goes to Negociacion de Minas San Rafael, in Zacatecas, Mexico. They are about to ship the machinery for a ten to twenty ton cyanide plant for the April Fool Mining Co., Ferguson, Nevada. A carload of machinery consisting of pans and settlers has just been shipped to Idaho for the Idaho and Pittsburg Mining Co. at Silver City. Two carloads of water-jacket furnaces have been shipped for the Arkansas Valley smelter at Leadville and for the Great National smelter at Monterey, Mexico.

## Recent Mining Dividends.

The Utah mine, Juab county, Utah, on the 9th declared its regular monthly dividend of $2000, or 2 cents per share. The mine has paid $150,000 in dividends. At the same time the Galena declared a dividend of 3 cents per share, or $3000, payable on the 10th. The mine has paid $18,000 in dividends since September, 1895.

## Recent Mining Incorporations.

The Oro Camino Gold Mining Company, San Francisco; capital stock, $100,000; W. and N. G. Butterfield, A. N. Hungerford, E. C. Rigney, W. S. O'Brien; to operate in Pine Peak, Calaveras county, Cal.

Ford G. M. Co., San Andreas, Cal.; capital stock, $1,000,000; directors, F. J. Solinsky, J. Raggio, M. C. Simans, G. C. Graves, W. S. Coulter.

## Coast Industrial Notes.

—At the Mare Island navy yard the Government employs at present 704 men.

—San Francisco painters have struck for $3 per day; $2.50 has been the ruling rate.

—The Pacific Mail Steamship Co., announces a 30c rate through to New York on some goods.

—At Knight's Landing, Cal., 78,000 acres of land will this season be drained and reclaimed.

—The Puget Sound, Mount Tacoma and Eastern Railroad Company has been incorporated at Tacoma, Wash.

—Negotiations are in progress looking to a consolidation of the San Francisco Gaslight Co., and the Edison L. & P. Co.

—A California company is now making steel prismatic dies for the manufacture of powder, instead of the brass dies in general use.

—The Redwood City, Cal., Electric Company has incorporated, to furnish light, heat and power in Santa Clara and San Mateo counties.

—Work is being pushed on the railway from Mill Valley, Marin Co., to the summit of Mount Tamalpais. The first locomotive for use on the new road is already on the ground.

—Competition between the old and new lighting companies at Fresno, Cal., gives that town the unusually low rate of $6.45 per month for all-night 2000-candle power arc lights.

—Los Angeles oil has jumped to 70 cents, and some Los Angelenos say it will go to $1. The oil steamer George Loomis is at Rodeo from Ventura with 8400 bbls. of oil for the Union Oil Company.

—The organizers of the coast lumber trust now claim to have ninety mills in the combine, and expect to advance the price of lumber next Monday. Their plans may be temporarily successful.

—The Chamber of Commerce of Tucson, Arizona, is urging Delegate Murphy to secure the passage of a bill in Congress authorizing Tucson to issue bonds amounting to $100,000 for water works and a sewage system.

—This week a bill was introduced in the Senate for the establishment of a department of Government to be known as the Department of Commerce and Manufactures, the head of which is to be a member of the President's cabinet.

—The Pacific Coast Steamship Company cut rates to Alaska so that the fare from here to Juneau, Alaska, is now $13 cabin and $7.50 second class. It's a good thing for the company, but many a poor fellow will be cursing the low rates next fall.

—The defense monitor Monadnock made her first trial trip last Monday. Her keel was laid at Mare Island Government navy yard twenty-one years ago. It was a fight to the finish to get her completed. No undue haste can be averred regarding her construction.

—Nearly $1,000,000 has been subscribed by the projectors of the Alameda and San Joaquin or "Corral Hollow" railroad, which is expected to be in operation by June 1st. It will be built between Stockton and the Corral Hollow coal mines, 36 miles, and may extend through Livermore to Oakland.

—C. F. Meek of New York has purchased the Mexico City street railway lines, comprising about 160 miles, and resold the same to Henry Butters of this city. The price is understood to be seven and a half million dollars. Butters is backed by London capitalists. The road is to be changed to an electric line.

—The Manufacturers' and Producers' Association are going ahead with their plans for a building of their own construction on a large lot between Market and Mission streets, on Twelfth street, this city. The contemplated structure is 175 feet front, 450 feet deep, and supplies nearly 13,000 square feet floor space for exhibits.

—The Murphy family have about concluded arrangements for the sale to an English syndicate of the Santa Marguerita ranch of 53,000 acres in San Luis Obispo county for a sum approximating $2,500,000. It will be subdivided and colonized by English settlers. H. F. Allen, who represents the purchasers, is now in San Jose concluding the negotiations.

—Messrs. Stetson, Spreckels, et al, have incorporated the Yosemite Valley and Merced Railway Co.; capital stock, $1,500,000, and will build a railroad from Merced through Mariposa county to the Yosemite Valley through a rich farming and mining country to one of California's grandest scenic centers. Surveys are almost completed and the work of grading will soon begin. The road will be a great thing for Merced and Mariposa counties.

—The Northern Pacific railroad has completed at its own shops a number of box cars designed for carrying grain, which have a capacity of 70,000 pounds. These are supposed to be the largest cars ever built for this purpose, and their carrying capacity is only equaled by a few specially constructed cars for particular uses. These cars are 42 feet long on the outside and 41 feet inside, 9 feet and 11 inches wide, and stand 12 feet 5½ inches from the rail to the top of the roof. They have a cubic capacity of 3157 feet, and each weighs about 32,000 pounds.

—The Dunsmuir *News* says the large mill formerly controlled by the Sisson Mill and Lumber Co. has been sold, and will hereafter be under the management of Messrs. Leland, Wood & Sheldon. The large body of timber four miles west of Sisson, on the Sacramento river, has been purchased by the same firm, and a party of surveyors are now at work surveying for a railroad to that point. The engine has already been bought for use on this road, and another will be purchased soon. There is sufficient timber in the purchase made to supply the mill for ten or twelve years to come. One hundred and fifty men will be employed at once.

—The Reno *Gazette* estimates that there are but 17,500 head of beef cattle on that side of the mountains. It is said that Shasta valley is about cleaned up, and if California must depend upon that section for three months' beef supply, when they use about 1,200 head a day, it looks as if they would be compelled to pay a little more for them than they have been paying.

—The plan for the reorganization of the Oregon Short Line & Utah Northern Railroad Company, as agreed to by all contending interests, calls for a foreclosure and a new company to be known as the Oregon Short Line Railroad Company. It preserves the entire system, and also the control of a block of Oregon Railway & Navigation stock, which is secured by $13,000,000 collateral trust bonds, the new Short Line Company paying the assessment upon the navigation stock. There ore 1480 miles in the Short Line system. Prior liens of $21,775,000 upon about 1180 miles will remain undisturbed, but the total indebtedness will be only about $25,000 per mile. The annual fixed charges of the company will be $1,853,270, as compared with $2,788,575 for the old company.

—The Chino *Champion* gives the following as the basis of agreement reached between the beet growers at Chino and the factory for 1896: First—A horizontal raise of 25 cents a ton for all beets, making the basic price $3.25 per ton, and a scale of 25 cents for each per centage of sugar above 12, as announced by Mr. Cottman last week. Second—All payments to be made from the office of the sugar company on rates as heretofore. Third—All beets above 12 per cent in sugar to be accepted regardless of purity. Fourth—The payment of the 5 per cent, retained until the land is cleared, to be made on the first regular pay day after any piece of land is cleared. Fifth—The check chemist, weighmaster and tare man to be selected by the farmers, and not to be discharged without the consent of the farmers' representatives or a fair hearing of any grievance.

## Personal.

F. A. HUNTINGTON has returned from a trip to Denver and Chicago.

R. L. POWELL is the new superintendent of the Standard Gold Mining Company at Gold Hill, N. M.

THEODORE ALLEN, late superintendent Big Canyon mine, now takes charge at the Utica, Calaveras Co.

W. F. ELMER, president of the Elmer-Brown Copper and Smelting Company, Waldo, Or., is at Grant's Pass, Or.

F. GUERRA, formerly of the Cargo Muchacho, will superintend Senator Dorsey's Picacho, San Diego Co., gold properties.

H. C. STILLMAN this week assumes the superintendency of the Santa Rosalia mine, Arizepe district, Sonora, Mexico.

J. W. NESMITH, president of the Colorado Iron Works, has returned to Denver after a pleasant visit to the Pacific coast.

JOHN W. PROUDFIT, the mining operator of Denver and Colorado Springs, has returned to Denver, after an extended trip through the Eastern States.

J. B. HOBSON, who has been superintending extensive hydrauiic mining operations at Quesnelle, B. C., is at his old home in Auburn, Placer Co.

AS LORD KELVIN reaches this year his jubilee as professor of natural philosophy in the University of Glasgow, the event will be celebrated in that city on June 6th.

WM. B. ROOT, president of the Colorado Mining Stock Exchange, is visiting the leading cities of the East in the interest of the exchange and legitimate stock investments.

GEO. H. EVANS, recently of the Golden Feather, Oroville, Cal., has been employed by the Horsefly G. M. Co., Cariboo, B. C., to superintend the construction of its hydraulic elevators.

LOUIS B. WALKER, late assistant superintendent of the Old Dominion Copper Mining and Smelting Company, has been appointed manager of the New Jersey Metal Refining Works at Elizabethtown, N. J.

ON May 1st, George H. Robinson retires from the management of the Golden Gate mine at Mercur, Utah, to give his attention to other personal interests. It is understood that H. A. Cohen, of De Lamar, Nev., will assume most of the duties formerly discharged by Mr. Robinson.

THOS. B. EVERETT, the well-known mining man, has returned to Denver from California, where he has been renewing old acquaintances among the scenes of his former triumphs. While on the coast he interested many Californians in Cripple Creek and Gilpin county mining properties.

SIR AUDLEY COOTE, who is pushing the transpacific cable project is in the city. He expresses confidence in his ability to get the matter on a substantial basis, and thinks that before the close of the century San Francisco will have telegraphic connection with Honolulu, New Zealand and Australia.

THOMAS W. GOAD, manager for the MacArthur-Forrest process in this country, is at Salt Lake City, Utah, with Hugh Butler, the attorney for D. H. Moffatt and others who have procured the rights under the patent in this country, to attend the case in which the Mercur Mining Company and the patentees are the principals.

GARDNER WILLIAMS, the well-known California miner, now manager of the De Beers, South Africa, mine, was last week arrested on a charge of supplying arms to the Uitlanders, but nothing serious is likely to result therefrom.

A. S. HALLIDIE, who for so many years was the efficient president of the Mechanics' Institute, has resigned. The office, which is purely an honorary one, involves considerable personal effort, and for some time Mr. Hallidie has been desirous of having some other gentleman assume the duties of the position. The directors having reluctantly accepted his positive request to be relieved, and declination of further consideration of his name in connection with the position, after three meetings, at which Messrs. Oscar Lewis and Jos. Leggett each received seven votes for president, last Wednesday elected E. A. Denicke president; Rodeny Kendrick, vice-president; E. P. Heald, recording secretary; and Joseph M. Cumming, corresponding secretary.

## Obituary.

VICTOR LAWRENCE, an American mining superintendent, was recently murdered and robbed in Mexico. He had been employed at the Lorenzo mine, near Sierra Mojada.

LAST Tuesday Robert J. Tomas, foreman at the Pioneer mine, above Iowa Hill, Placer Co., fell down a 200-foot shaft and was instantly killed. His skull was fractured, and his neck, arm and one leg were broken. Mr. Tomas was a shareholder in the Mountain Gate and Hidden Treasure mines.

EX-MAYOR N. A. RIDEOUT, of Marysville, Cal., was almost instantly killed last Sunday afternoon in the Pershbacker mine, Magalia, Butte Co., by being struck on the head by a large rock from the roof of a stoping station at the bottom of the shaft, where an engine and pump were being put in. Deceased was in the 35th year of his age, a son of N. D. Rideout of this city, owner of the mine, and deservedly popular with a large number of people, who learn with sincere regret of his sad death.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING MARCH 3, '96.

555,681.—HANDHOOK—H. F. Dalton, Azusa, Cal.
555,805.—BRICK MACHINE—W. E. Damon, Pomona. Cal.
555,569.—AMALGAMATOR—Daniel Feit, S. F.
555,775.—SPEED MEASURE—G. E. Kastengren, S. F.
555,563.—COPYING PRESS—E. B. Millert, Portland, Or.
555,830.—PRESERVING GRAPE JUICE—C. Stanbes San Jose, Cal.
555,537.—LEATHER DRESSING—Stevens & Shroeder, Arago, Or.
555,797.—WRENCH—J. D. Wilson, San Diego, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates. and in the shortest possible time.

## Every Inventor Wants a Good Patent

Or none at all. To secure the best patents Inventors have only to address DEWEY & Co., Pioneer Patent Agents, No. 220 Market St., San Francisco.

*There are many good reasons why Pacific Coast Inventors should patronize this Home Agency.*

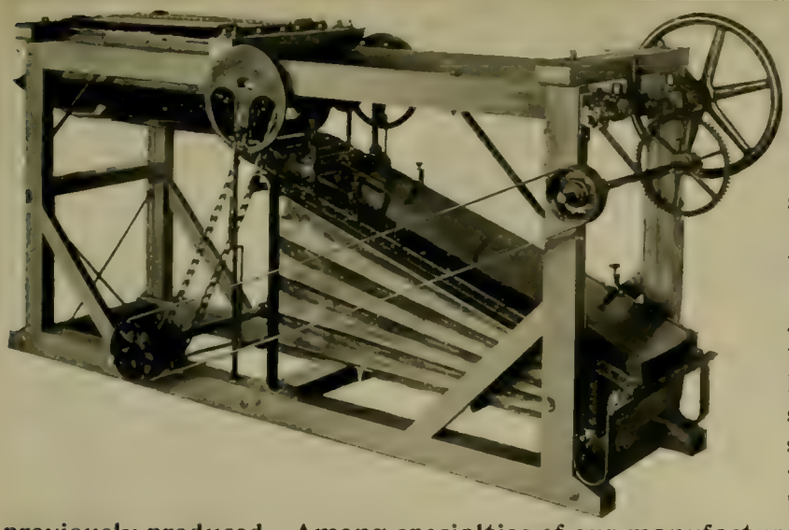
It is the ablest, largest, best, most convenient, economical and speedy for all Pacific Coast patrons.

It is the oldest on this side of the American continent, most experienced, and in every way reliable.

Conducted from 1863 by its present owners (A. T. Dewey, W. B. Ewer and Geo. H. Strong), this agency has the best knowledge of patents already issued and of the state of the arts in all lines of inventions most common on this coast.

Patents secured in the United States, Canada, Mexico, all British colonies and provinces, England and other civilized countries throughout the globe.

Caveats filed, assignments duly prepared, examinations made, and a general Patent Agency business conducted.



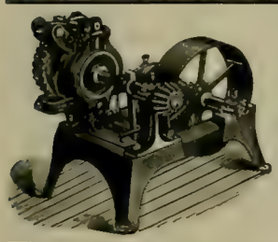
Established and successfully and popularly conducted for nearly thirty years, our patrons number many thousands, to whom we refer with confidence, as men of influence and reliability. Old and new inventors are cordially offered the complimentary use of our library and free advice, etc. No other agency can afford Pacific States inventors half the advantages possessed by this old, well-tried and experienced firm.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee. If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.



WE make mining machinery of all kinds. We also "make the Miner," that is, Woods' Dry Placer Miner, as illustrated here. Users say it is "really perfect." In writing about it ask for catalogue 51.

Smelters are using our semi-steel moulds, kettles and pots extensively; they give first rate satisfaction. We are also making welded steel water jacket furnaces, better than anything previously produced. Among specialties of our manufacture are perforated metals; also riveted steel pipe for hydraulic lines. You will find us obliging in making estimates and giving particulars, as we aim to serve the interests of our customers in the best way.

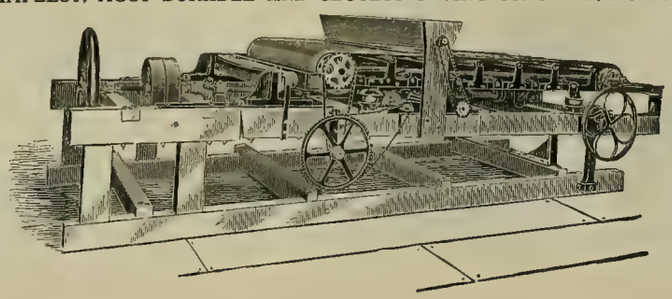
# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,

E. L. BALLOU, Propr. Ballou Reduction Works.

# Market Reports.

## The Markets.

SAN FRANCISCO, March 12, 1896.

While general trade is reported quiet, yet it shows a larger volume of goods going out than at this time last year. Crop prospects are of a most encouraging nature for both cereals and fruits. The larger handlers of wheat are not disposed to operate on present prospects, knowing by experience that on the April and May weather depends the making of good crops, while in fruits frosts are liable to occur at an inopportune time; but at this writing everything points to a good outturn. From the mining districts good news continues to come to hand. It is conceded that there will be more activity in gold mines than even marked 1895. Capital, it is said, is still seeking profitable investment. Manufacturers of mining machinery report an active demand for late and better improved. Strikes in the building trades in this city have a temporarily bad effect. Until these are well over contractors will fear to make bids on new work. In railroad machine works more men are being put to work so as to make cars conform to the new law of Congress, besides which more rolling stock is being built so as to be prepared to move any increase in the crops.

**New York Silver Prices.**

NEW YORK, March 12.—Following are the closing prices for the week:

| | Silver in London. | N. Y. | Copper. | Lead. |
|---|---|---|---|---|
| Friday | 31 5-16 | 68⅜ | 11 | 3 15 |
| Saturday | 31 5-16 | 68⅜ | 11 | 3 15 |
| Monday | 31⅜ | 68½ | 11 | 3 15 |
| Tuesday | 31 7-16 | 68⅝ | 11 | 3 12½ |
| Wednesday | 31 7-16 | 68⅝ | 11 | 3 10 |
| Thursday | 31 7-16 | 68⅝ | 11 | 3 10 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.87 |
| London Merchants | $4.85 |
| London Sight Bankers | $4.88½ |
| Refined Silver, peroz., 1000 fine | 68⅞c |
| Mexican Dollars | 55½@56c |

SILVER.—There has been a stronger tone to the market at home and abroad. This is quite significant in the absence of any increase call from the demand markets and also a decided falling off in the shipments to China, India and the Straits. The debates in regard to bi-metallism in the German Reichstag have attracted attention. These debates have brought out the fact that at present the English Government is opposed to opening the Indian mints to silver. In our market there is nothing new to report, last week's review covers this week's information regarding the general situation.

MEXICAN DOLLARS.—The market, as usual to the season of the year is quiet. The demand seems to be improving in a small way but it is still light. Dealers quote 55½ to 56 cents.

COPPER.—The markets at the East and abroad are reported strong, with a good consumption but no speculative inquiry. It is conceded that the consumption will be quite heavy for some time to come owing to the active military and naval operations and more doing for electrical purposes. The output on this coast shows an increase, particularly in Arizona.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 11@12 |
| Sheet copper | 17 |

LEAD.—The market is weaker at the East under free supplies and no improvement in the demand. In our market pig is easier with quotations shaded. Unless there is a change for the better at the East, lower quotations will be made for our next week's issue.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 90 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—There is nothing new to report in the general situation.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | | | $1 40 |
| Drop, B and larger sizes, | " | " | 1 65 |
| Buck, Balls and Chilled, do, | " | " | 1 65 |

QUICKSILVER.—The stock in all supply markets is said to be in excess of wants, but the combination does not quote lower prices. The depression in silver mining is against quicksilver.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 40 00 |
| West Coast of Mexico, for Export | 35 00 |

BORAX.—The market is reported steady at unchanged quotations. Shipments East are fair for the season.

The market is quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6⅛ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6¼ |
| Concentrated, " | 5⅝ |

TIN.—Heavy stocks at the East and abroad are against the market for pig in the absence of any increased consumption demand. Fruit canners are not anticipating their expected wants to any extent either on this coast or at the East. The large production of American plate is against foreign.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14⅝c@14¾c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

IRON.—Eastern advices report unsettled markets with a strong selling competition between Western and Southern furnacemen. In our market prices fluctuate, but the general tone is easier. The consumption is expected to be larger this year than it was in 1895.

ANTIMONY.—A fair movement for the season is reported on the basis of 9 to 10c.

COAL.—For cargoes to arrive and shipment the market is reported unchanged, but it is stated that for some varieties a shading can be secured. For spot there is nothing new to report. It is thought that there will be an increase output of domestic.

The market is quoted as follows:

SPOT FROM YARD—PER TON.

| | |
|---|---|
| Wellington | $7 50@ 8 00 |
| Greta | 6 00@ 6 50 |
| Nanaimo | 6 50@ 7 00 |
| Gilman | 5 50@ 6 00 |
| Seattle | 5 00@ 5 50 |
| Coos Bay | —@ 4 50 |
| Cannel | —@ 8 00 |
| Egg, hard | —@13 00 |
| Wallsend | —@ 6 50 |
| Scotch Splint | —@ 7 50 |
| Brymbo | —@ 7 50 |

TO ARRIVE—CARGO LOTS.

| | |
|---|---|
| Australian | 5 25 |
| Liverpool Steam | 6 25 |
| Scotch Splint | — — |
| Cardiff | 6 25 |
| Lehigh Lump | 9 00 |
| Cumberland | 13 50 |
| Egg, hard | 10 00 |
| West Hartley | 6 50 |

COKE.—The market for spot continues against sellers, which have an unfavorable influence on to arrive and for shipment. The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 8 50 |
| " in sacks | — — | @ | 9 50 |
| Cumberland | — — | @ | — — |

LUMBER.—Advices from lumbering camps state that the outlook is favorable for a continued free export movement. For home purposes the impression prevails that there will be a larger consumption.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 17 00 | @ | — — |
| Pine | 13 00 | @ | 18 00 |
| Spruce | 25 00 | @ | 30 00 |

NAILS.—Dealers state that sales so far aggregate larger in volume than at this time for fully two years past. The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 07½ |
| " jobbing, " " | 3 20 |
| Cut, carloads, " " | 2 82½ |
| " jobbing, " " | 2 95 |

## Mining Share Market.

SAN FRANCISCO, March 12, 1896.

The market held to fairly firm prices at a slight advance on last Friday and Saturday. The most strength seemed to be in Con. Virginia and Hale & Norcross, the former owing to connection on the 1000-foot level having been made with Ophir, and that in Hale & Norcross owing to the impression that the contest for the control of the mine would cause higher prices before election. On Monday the market opened weaker, which was followed by easier prices on Tuesday and a still further shading off on Wednesday. In the shading off Con. Virginia and Hale & Norcross took the lead, with the latter selling yesterday at 20 per cent below Friday's highest prices. Of course, the rest of the market moved up and down in sympathy with the leaders. The contest for the control of Hale & Norcross absorbed the attention of the trading public, and now that it is over and with the Jerry Lynch-M. W. Fox crowd in control, it is not at all unlikely but more attention will be given to the general market. Of Ex-Senator Lynch's ability as a mine manager the writer has no knowledge, but in R. V. Collins, who has been elected secretary of the company, he will find a person well informed and, so far as can be learned, one who will act for the interest of all stockholders. While holding strong views against the way in which the mines have been managed, yet the writer hazards the opinion that he will not allow his opinions to swerve him in the discharge of his duty to all interests concerned, and it is safe to affirm that this course will be followed by the other officials. The new superintendent, Mr. Tangerman, has had large experience as a practical miner, and it is quite safe to affirm that he will do all in his power to develop the mine, but unless there is a big body of ore in it, it will be quite impossible for him to find one. Time alone will tell the wisdom of the change. The new officials have started out in the right direction by reducing expenses, which will be followed by cutting off all sinecure positions. It is to be hoped that other companies will follow in this reform movement, which, if done, will make fewer assessments and put them more on business propositions than on lines heretofore carried on. At this writing it is too soon to judge the effect on the market, but it should not cause surprise if more life will be given the market and slightly higher prices rule; but if expectations of an ore strike are not realized the market cannot be sustained, for there does not seem to be any speculative movement. Prices seem to be regulated by the prospects in sight, and when this is the case they will rule more on a legitimate basis.

The news from the Comstock mines is essentially unchanged and nothing of importance looked for yet a while. In the Alta group the work appears to be largely of a kill-time character. In Alta they are still playing hide-and-seek with the Keystone ledge, with nothing, apparently, in sight but another assessment, probably in six months, for even ore cannot be found without work, and this eats up money. The output of ore by Overman the past week shows an increase, but the quantity is still insignificant compared with the expense. Exploiting work on a limited scale is still the order. In Belcher the work ought to show up better before long, also that under way in Crown Point. That under way in the latter mine is at several points, but it seems to be in the nature of laying the foundation for active exploiting later on, which means another assessment, at any rate, before many weeks pass. From Yellow Jacket reliable news is hard to get. Several rumors are current, but so far as can be learned they are not deserving of credence. In the other Gold Hill mines, Confidence, Challenge, Con. Imperial, the work under way points to the west lode, but how much longer time will be required to show up the west side is, as yet, an open question. In prosecuting the work ore ought to be run into in one or two of these mines which, while not large, should create a riffle in the shares. In the middle group of mines active work still continues, with each company reporting ore extracting as it is being prosecuted. It seems to an outsider as if the managers follow up favorable indications and veins in the hope that they will lead up to something much better. What change will be made in the character of the work in Hale & Norcross is as yet hard to say, but it is reasonable to assert that when the new superintendent and officials become more familiar with the situation a change will be made, and it is hoped for the better. It may be they will ascertain if reports of a big body of ore in the mine are true, or if they were put out for speculative purposes. Very little attention is given to the work under way in both Gould & Curry and Best & Belcher. It seems as if dealers' interests lie with the work going on in Con. Virginia, and it would appear from all advices at hand they are justified in looking to that old stand-by. On several levels active work is under way, and if a body of ore is to be found it would seem as if the managers will find it. The connection with Ophir on the 1000-foot level will admit of this level being exploited, but time and large sums of money will be required for the work. In Ophir, Union and Sierra Nevada there is nothing new at hand regarding the work being done. It seems as if the foundation is being laid for more activity within the next nine or twelve months.

From the Brunswick lode our advices are of a similar character to that heretofore reported in this department. The work in Occidental is still of an active dead-work nature. The managers appear determined to let nothing be undone which is calculated to lead up to ore, but as yet results have been disappointing. The work at other points on the lode is being done in a kind of half-hearted way. The managers seem to be waiting for results from that under way in Occidental.

From the Bodie district nothing of interest is at hand. The official letters continue to report distances run, but no ore found. Bodie levied a 15-cent assessment the past week. This mine is very economically managed, for assessments are few and far between. It seems singular the shares owned by the company are not sold so as to help secure working funds.

The following illustrates the changes of the week:

| MINES. | Mar. 5. | Mar. 12. |
|---|---|---|
| Alpha | ..... | ..... |
| Alta Consolidated | $ 14 | $ 14 |
| Andes | 27 | ..... |
| Belcher | ..... | 20 |

# Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, Cal.; location of works, Auburn, Placer county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of February, 1896, an assessment (No. 2) of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of April, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made be before, will be sold on THURSDAY, the 30th day of April, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office—237 Twelfth street, San Francisco, California. Office hours from 8 to 10 P. M.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 10th day of February, 1896, an assessment (No. 3) of 5 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 38 Crocker Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of March, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on FRIDAY, the 10th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

E. C. GODFREY, Secretary.

Office, 38 Crocker Building, San Francisco, California.

CON. CALIFORNIA AND VIRGINIA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of March, 1896, an assessment (No. 6), of 30 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1896, an assessment (No. 5) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 56, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 4th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 56, No. 309 Montgomery street. San Francisco, California.

If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**

**220 Market Street ..... San Francisco, Cal.**

### *Assaying.—Part I.—Gold and Silver Ores.*

Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth, 1889. Price, postpaid .....$1 00

### *Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid .....$1 75

### *Assayer's Guide.*

By Oscar M. Lieber .....$1 50

### *Assayer's Manual.*

By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

### *Manual of Assaying—Gold, Silver, Copper and Lead Ores.*

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 334 pp. Price, postpaid.....$2 50

### *Notes on Assaying and Assay Schemes.*

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo, cloth .....$3 00

### *Blowpipe Analysis—Manual and Qualitative.*

By F. M. Endlich.....$4 00

### *A Practical Guide for Prospectors and Miners*

By C. W. Moore. With numerous illustrations.....$4 75

### *The Explorer's and Assayers' Companion.*

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

### *Aaron's Leaching Gold and Silver Ores.*

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid .....$3 00

### *Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

### *The Lixiviation of Silver Ores with Hyposulphite Solutions.*

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth .....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

### *Modern Copper Smelting.*

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

### *The Metallurgy of Gold.*

By M. Eissler. Profusely illustrated.....$5 00

### *Losses in Gold Amalgamation.*

By W. McDermott and P. W. Duffield.....$2 00

### *Electricity in Mining.*

By Sylvanus P. Thompson..... 80 cts.

### *Practical Treatise on Hydraulic Mining.*

By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid.....$5 00

### *Practical Hydraulics.*

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

### *Hydraulic Gold Miner's Manual.*

By T. S. G. Kirkpatrick. With plates and cuts.....$2 25

### *Manual of Hydraulic Mining for the Use of the Practical Miner.*

By T. E. Van Wagenan.....$1 00

### *The Sampling and Measurement of Ore Bodies in Mine Examinations.*

Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

### *Manual of Mining.*

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

### *A Text Book of Mineralogy.*

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

### *Manual of Determinative Mineralogy.*

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

### *Metallurgy of Silver, Gold and Mercury in the United States.*

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 50

### *Metallurgy of Silver, Gold and Mercury—Continued.*

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

### *Notes on the Treatment of Gold Ores.*

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

### *A Practical Manual of Minerals, Mines and Mining.*

By H. S. Osborn.....$4 50

### *Matte Smelting—Its Principles and Later Developments, with an Account of the Pyritic Processes.*

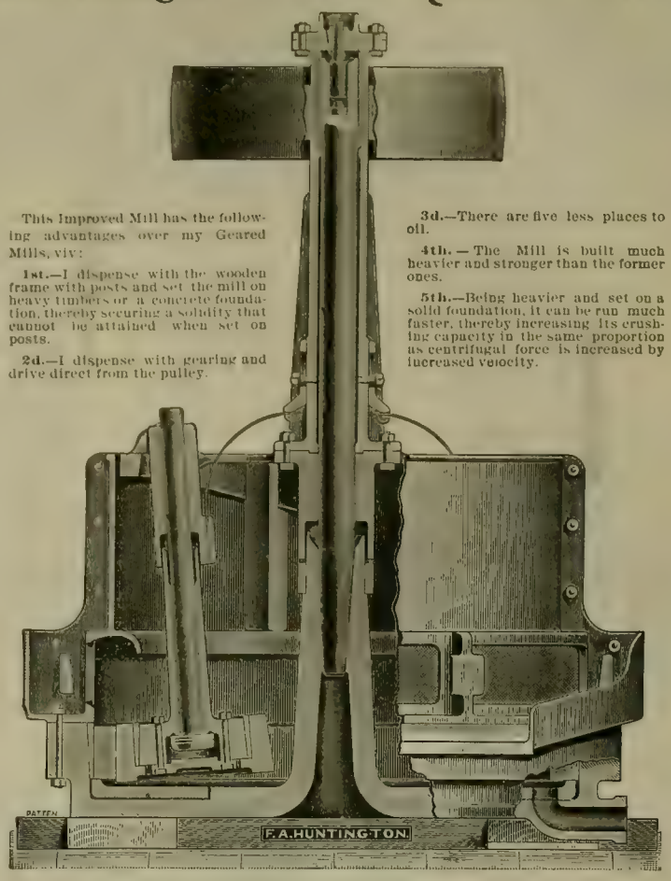
By Herbert Lang.....$2 00

### *Introduction to the Study of Metallurgy.*

By W. C. Roberts-Austen.....$4 00

### *Practical Metallurgy and Assaying.*

By A. H. Hiorns.....$1 50



### *The Practical Metal Worker's Assistant.*

By Oliver Byrne. Illustrated.....$5 00

### *Quartz Operator's Handbook.*

By P. M. Randall.....$2 00

## F. A. HUNTINGTON'S NEW IMPROVED
# Centrifugal Roller Quartz Mill.

This Improved Mill has the following advantages over my Geared Mills, viz:

**1st.**—I dispense with the wooden frame with posts and set the mill on heavy timbers or a concrete foundation, thereby securing a solidity that cannot be attained when set on posts.

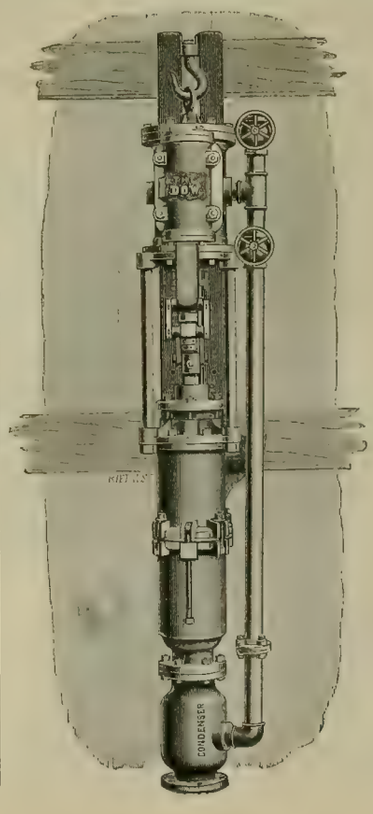
**2d.**—I dispense with gearing and drive direct from the pulley.

**3d.**—There are five less places to oil.

**4th.**—The Mill is built much heavier and stronger than the former ones.

**5th.**—Being heavier and set on a solid foundation, it can be run much faster, thereby increasing its crushing capacity in the same proportion as centrifugal force is increased by increased velocity.

**Manufactured by F. A. HUNTINGTON,**
**143 First Street, San Francisco, Cal.**



# DOW STEAM PUMP WORKS.

**OFFICE AND WORKS: 114 and 116 BEALE St., San Francisco.**

—— MANUFACTURERS OF ——

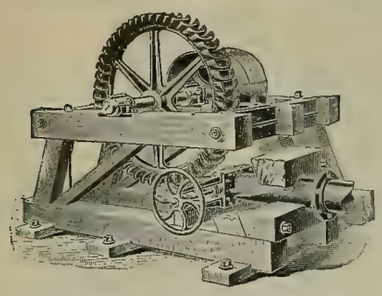
# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.



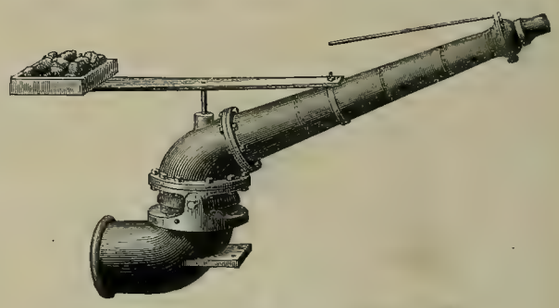
For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to ADAMS & CARTER), 132 Market St., Room 15, San Francisco.

# RISDON IRON WORKS.

OFFICE AND WORKS, COR. BEALE AND HOWARD STS., SAN FRANCISCO. CABLE ADDRESS, "RISDON'S," SAN FRANCISCO.



The above cut shows the general arrangement of one of Knight's Standard Water Wheels, of which there are more than 450 in use in California alone. These wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000 horse power, and adapted to all heads and purposes.
Descriptive circulars mailed free on application.

## The Union Ore Concentrator.

So large a percentage of ore value lies in the sulphurets that the matter of concentration is of prime importance in nearly every mill. For twenty years practical miners and builders of mining machinery have given the manufacture of concentrators the closest attention, with the result that in no branch of the mining industry have scientific skill and economy been more successful in producing the best results. Herewith is illustrated the latest, the Union, for which a patent was last week issued to Willis G. Dodd of the Union Iron Works of this city. There is no departure from the general type of concentrating machine, and it does not require any detailed description, the illustrations portraying its principal points to those familiar with this class of mining appliances. It is constructed entirely of iron and brass, and consists of an inclined shaking frame or table, suspended by hangers or links from the four iron posts or columns shown. A side shake or lateral motion is imparted to the frame by means of steel connecting rods, attached to adjustable cranks, keyed to main driving shaft. Upon the shaking frame is mounted or stretched an endless rubber belt, with raised or flanged edges, forming the bed or plane upon which the dressing of the ore is effected. This belt or bed is caused to travel continuously up hill by rotating the head roll or drum, the power for which is transmitted by means of a link-chain belt and sprocket wheels, driven from the worm and gear shown. The travel of the belt is under full control, and can be regulated to any speed required. The operation of the machine is as follows: The pulp or crushed ore from the battery is conveyed to the distributor located on top of the shaking frame above the belt. This distributor spreads the pulp evenly over the surface of the bed or belt, which is moving continuously up hill or toward the head of the machine. The side shake or lateral motion given the bed causes the sulphurets and valuable metallic portions of the ore to settle and lay upon the surface of the belt, and, as they pass up hill or toward the head of the machine, they come under the water-box, delivering clear water in fine streams upon the belt; and, as the pulp passes through these streams, the worthless or lighter portion of the ore is "winnowed" out or washed from the valuable portions, and passes down the belt into the tailing sluice. The valuable portions of the ore, which still adhere to the belt, pass on over the head roll until they come in contact with the small wooden automatic discharge roller shown. Here the moisture, still clinging to the belt, forms a water cushion, which causes the concentrates to leave the belt and deposit themselves in the small box resting upon the water tank, into which the belt is depressed for the purpose of washing off any fine sulphurets that may have escaped the automatic discharge. When filled the box is removed and another substituted, thus making the process of concentration continuous and automatic.

UNION ORE CONCENTRATOR, WITH SULPHURET DISCHARGE.

DETAIL OF UNION ORE CONCENTRATOR.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Union Ore Concentrator, with Sulphuret Discharge; Detail of Union Ore Concentrator. 221. B. & O. Tunnel; Dynamometer Diagram, B. & O. Electric Locomotive; Dynamometer Diagram, B. & O. Electric Locomotive, 226.

EDITORIAL.—The Union Ore Concentrator, 221. Some Proposed Mining Legislation; "Nothing is Impossible;" New York Shocked at the Sight of Men Buying Mining Stocks; Frantic Effort to Head Off the Mineral Land Bill, 222.

ELECTRICAL PROGRESS.—Experience with the Electric Locomotive in Baltimore, 226-227. Tesla's Hope, 227.

SCIENTIFIC PROGRESS.—The Most Interesting Stellar System Yet Investigated; The Ray Lamp; First Experiments in Flying, 227. Results of the French Magnetic Survey; Important Bearing Upon Photographic Results; Exploration of the Himalaya Mountains, 228.

MECHANICAL PROGRESS.—A Railroad with an Original Feature; A New Safety Cartridge; Aluminum; Pease's Tubular Construction; The Mine Surveyor Should Carefully Test His Lamp; Cost of the Kiel Canal; "The New British Trade Route to the Pacific;" Horseless Carriages, 228.

PRACTICAL INFORMATION.—Incrustation in Gas Engine Jackets; Metallic Precipitation; No Such Thing as the H. P. of a Boiler; Danger at an Elevation of 25,000 Feet; New Way to Mine Sulphur; A Ship's Rate; The Brooklyn Bridge; Proper Function of the Stomach; Plans for the Construction of an Electric Plant; Greatest Depth at Which Earthquakes Originate, 229.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 230-31.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 238.

MISCELLANEOUS.—Concentrates, 223. Assaying at Mines and Works in Colorado; The Metric System, 224. Tributary to Yuma; An Argument for an Appropriation; Diplomatic Mr. Grove, 225. Coast Industrial Notes; Obituary; Recent Mining Dividends; Personal; Recent Publications; Books Received, 232.

WHILE determined discoverers justly maintain as a fundamental principle that nothing is impossible, yet it is difficult at times to reconcile the present state of an art with all that is claimed for it by enthusiastic experimenters, even though they have considerable scientific prominence. The best that can be done is to maintain a suspension of judgment. "Nothing is impossible," but proof in exact scientific work is essential. These things are not matters of belief. Dr. Pratt, of the Chicago College, inventor of the Pratt Telephone, and for many years prominently connected with the Bell Telephone Co., now announces as a result of some experiments regarding the "Roentgen rays" that, so far as results are concerned, there is no difference between a Crooke's tube and a horseshoe magnet, and claims positively to have secured with the use of a magnet the same results now so universally produced by cathode rays. If these unknown rays are proved to be lines of electrical force, applicable in a variety of ways, the horizon of science perceptibly broadens and a great advance will be made in organized knowledge. In this connection it is to be noted that sufficient experiment has now been made to establish the fact that all substances through which the Roentgen rays pass become for the time conductors of electricity.

THE frantic efforts of Commissioner Lamoureux of the General Land Office to head off the Mineral Land bill were justly treated with contemptuous indifference by the Senate committee which unanimously recommended the bill. It still has to run the gauntlet and is far from safe. Formidable opposition is now encountered in the person of Senator Stewart of Nevada, who objects to the bill. His motives are well understood and are no more creditable to him now than similar action of his on former occasions. Less easy to understand is the attitude of Senator Mitchell of Oregon, who is also reported in opposition to the measure, as the bill applies solely to California and does not affect the rights of the Northern Pacific Company in any way. The fact that the bill is purely a California measure and that the nine gentlemen composing the California Congressional delegation solidly favor it is of decided advantage, and it is to be hoped that the effort so long and determinedly made will eventually succeed, but the friends of the measure feel anxiety as to results. The merits of the movement have been so thoroughly discussed that nothing now remains to do but await final action on the part of our national legislature. It were unfortunate if corporation attorneys should be able by the possession of seats in Congress to thwart a measure of such justice to the commonwealth.

## Some Proposed Mining Legislation.

Nearly every State in the Union where mining is carried on finds the present mining laws unsatisfactory. So much has been said on this subject in these columns regarding California's requirements that any discussion of the matter would largely be a repetition. Since Senator Stewart got the first definite piece of U. S. mining legislation through in May, '72, there has been a steady comment on the unfavorable and unsatisfactory nature of some of the Federal statutes. Several years ago the Nevada Senator prepared a bill which he has since presented at various times and which has passed the Senate, and on some other occasion passed the House, fortunately, however, these occurrences never taking place during the same session of Congress. This pet perennial measure was promptly introduced by Senator Stewart on the first day of the session of the present Congress and referred to the Committee on Mines and Mining, where it slumbers. On Dec. 26th, '95, Senator Perkins of this State introduced a bill which is believed to be in accordance with the needs and wishes of the miners of this State, and is in harmony with the wants of the mining industry of this coast in general. On the same day Congressman Johnson introduced the same bill in the lower House. The full text of the Perkins-Johnson bill is as follows:

A BILL TO AMEND CHAPTER SIX OF TITLE THIRTY-TWO OF THE REVISED STATUTES, RELATING TO MINERAL LANDS AND MINING RESOURCES.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled*, That section twenty-three hundred and twenty-four of the Revised Statutes be amended so that the same shall read as follows:

"SEC. 2324. Miners of each mining district may make regulations, not in conflict with the laws of the United States or with the laws of the State or Territory in which it is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground, so that its boundaries can be readily traced, *such marking to include one post or monument at each corner of the claim.* All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location and such description of the claim or claims located, by reference to some natural object or permanent monument, as will identify the claim. On each claim located, *and until payment of the purchase money and a certificate of entry has been issued therefor*, not less than one hundred dollars worth of labor shall be performed or improvements made during each year.

"Where such claims are held in common, such expenditure may be made upon any one claim *by any work or improvements tending to develop any of such claims.* The period within which the work required to be done annually on mineral claims is to be performed shall commence at twelve o'clock *meridian on the first day of January* succeeding the day of location of such claim.

"When the labor required by this Act shall have been performed, or the improvements made, an affidavit may be filed within thirty days after the time limited for the performance of such labor, or making of such improvements, with the recorder of deeds in the county in which the claim or mine is situated, particularly describing the labor performed and the improvements made, and the value thereof, which affidavit shall be prima facie evidence of the facts therein stated; and upon failure to comply with the conditions of this Act, in the performance of labor or the making of improvements, the claim or mine upon which such failure occurred shall be open to relocation in the same manner as if no location had ever been made: *Provided*, That the original locators, their heirs, assigns or legal representatives do not resume work upon the claim after such failure and before such relocation, and continue the same with reasonable diligence until the required amount of labor shall have been performed or improvements made. Upon the failure of any one of several co-owners to contribute his proportion of the expenditure required hereby, the co-owners who have performed the labor or made the improvements may, at the expiration of the year, give such delinquent co-owner personal notice in writing, or notice by publication in the newspaper published nearest the claim, for at least once a week for ninety days; and if at the expiration of ninety days after such notice in writing, or by publication, such delinquent shall fail or refuse to contribute his proportion of the expenditure required by this section, his interest in the claim shall become the property of his co-owners who have made the required expenditure. A copy of such notice, together with an affidavit showing personal service or publication, as the case may be, of such notice, when filed and recorded with the recorder of deeds in the county in which such mining claim is situated, shall be prima facie evidence of the acquisition of title of such co-owners. Where a person or company has run or may run a tunnel, or constructed roads or trails, for the purpose of developing a claim or claims owned by said person or company, the money so expended in running said tunnel or constructing said roads or trails shall be taken and considered as expended on said claim or claims: *Provided further*, That said claim or claims shall be distinctly marked on the surface as provided in this Act."

SEC. 2. That section twenty-three hundred and twenty-four of the Revised Statutes be amended by adding thereto the following:

"And the surveyors appointed under the provisions of this section shall have power to administer oaths to their assistants."

SEC. 3. That section twenty-three hundred and thirty-five of the Revised Statutes be amended so as to read as follows:

"SEC. 2335. All affidavits required to be made under this chapter may be verified before any officer authorized to administer oaths in the State or Territory where the claims may be situated having an official seal, and all testimony and proofs may be taken before any such officer, and when duly certified by the officer taking the same, attested by his seal of office, shall have the same force and effect as if taken before the register and receiver of the land office. Whenever any contest shall arise as to the mineral character of any land claimed to be subject to entry or sale under an Act of Congress, all proceedings shall be stayed until the controversy shall have been settled or determined by a court of competent jurisdiction in the county where such land is situated, or the contest withdrawn; and it shall be the duty of the register of the land office in which such contest is made to immediately certify such contest to such court, and to immediately notify the contestant and contestee thereof.

"Within thirty days after filing such contest the contestant shall file in such court a verified statement of the facts upon which he bases his contest, in plain and concise language, and shall serve the same upon the contestee; and thereafter, and within the time provided by the laws of the State or Territory where such land is situated, for answering in any civil action, the contestee shall file his verified answer to such statement, and thereupon the contest shall be tried and determined as are ordinary actions in such court; and when determined, such determination shall be certified to the register, and such determination shall be binding upon him, and shall be forever conclusive as to the character of the land in question: *Provided*, That the presence of rock, earth or gravel, bearing gold, silver, cinnabar, petroleum or other valuable mineral, shall be regarded as prima facie evidence that the land containing the same is mineral in character: *And provided further*, That in investigating the character of land with a view to ascertaining whether it is more valuable for mineral than for agricultural purposes, evidence may be taken of the mineral discovered or developed adjacent to such land, proof of which shall be taken as presumptive evidence that the land in question is mineral in character: *And provided further*, That wherever land is proven to be within a well-defined mineral belt, such land shall be deemed, presumed and taken to be mineral land, unless the contrary is proven: *And provided further*, That the provisions of this chapter shall be liberally construed, with a view to aid the applicant in procuring title to the mineral lands of the United States, and that the rules and regulations prescribed by the land department for its government and that of its officers in disposing of said lands shall be so formulated and administered as to assist the Government in disposing of said lands to bona fide applicants: *And provided further*, That all applicants for patent for lands upon which exists a valid mining location, the notice of location of which, designating the section and township in which such location is situated, shall have been recorded in the office of the recorder of deeds of the county wherein the land in question is situated, must, except when otherwise in this Act provided, give to such mineral claimant notice of such application in writing, or by publication in the newspaper published nearest such mining location at least once a week for sixty days."

SEC. 4. That section twenty-three hundred and thirty-seven of the Revised Statutes be amended so as to read:

"SEC. 2337. Where non-mineral land not included in a lode claim is used or occupied, or is intended to be used or occupied, by the proprietor of such vein or lode claim for mining or mineral purposes, such non-mineral surface ground may be embraced and included in an application for a patent for such vein or lode claim, and the same may be patented therewith or separately, subject to the same preliminary requirements as to survey and notice as are applicable to vein or lode claims; but no location hereafter made of such non-mineral land shall exceed ten acres, and payment for the same must be made at the same rate as fixed by this chapter for the superfices of the lode claim. The owner of a quartz mill or reduction works, not owning a mine in connection therewith, may also receive a patent for his mill site as provided in this chapter."

The bill is printed in full, as it is of considerable importance. The Stewart bill was printed twice in this column during the last session of the 53rd Congress. It is the same old bill. Those who have kept the run of these matters will note that the Stewart bill differs materially from the Perkins-Johnson bill in many respects. For instance, as to the amount of work to be done on a mining claim; the time when the labor shall be performed and so on; and the Stewart bill omits many valuable provisions in the Perkins-Johnson bill. One of the principal objections to the Stewart bill is as to the amount of labor required to be performed on placer claims, which many think is altogether too high, and the provision allowing affidavits to be made in any part of the United States. The Perkins-Johnson bill is the result of much thought upon the part of the Committee on Legislation of the California Miners' Association, after consultation with some of the best mining lawyers in California. The plan was to make as few changes as possible, and those in the direction of clearness and with a view to aid in the development of our mineral resources. The first change occurs in the last words in the first sentence in the first paragraph of Sec. 2324, by the addition of the italicized words in that sentence. In the same paragraph in the last sentence the provision for the performance of labor until patent issues is stricken out, and the italicized words inserted in its stead. In the next paragraph are added the italicized words. In the concluding sentence of that paragraph the time for commencing the annual work is made 12 o'clock noon on Jan. 1, instead of midnight preceding. In the next paragraph beginning "a copy of such notice" is a provision for the filing of an affidavit which shall be prima facie evidence of the accession of title through the steps required by the preceding provision. In the second sentence of the first paragraph in the proposed revision of Sec. 2335, ending with the words "in question," in the second paragraph of that proposed revision is what is believed to be the most important feature of the Perkins-Johnson bill. This relates to the transfer of contests from the land offices to the local courts. This provision is most important to the California miner. Senator Stewart agrees that

it may go in. Beginning with the italicized word "*Provided*," and ending with the last word in that paragraph, occur other provisions that are deemed of importance and which are but briefly contained in the Stewart bill. These should also be held to tenaciously. In section 2337 the word "ten" is used in place of the word "five," so that a mill site may consist of ten acres instead of five as previously. Further comment is hardly necessary, for with the two bills before the intelligent reader he can readily see the difference, and by consulting the old law, which will be found in the Revised Statutes, can understand the changes sought to be made.

Some objection has been raised as to the transfer of contests concerning the character of land to the local courts, some lawyers claiming that the United States has no power to confer the needed jurisdiction upon the State courts. In arguing the matter State Senator Ford has made the point that there is a precedent for this character of proceedings in the manner of determining adverse claims under applications for mineral patents. This proceeding is provided for in section 2326 of the Revised Statutes. This section, in effect, provides that where an adverse claim is filed against an application for a mineral patent, the question of right of possession, or, in other words, the right to purchase, shall be referred to the proper local court, whose judgment or decree shall be binding on the land office authorities. This is the same principle which miners have applied to contests as to the character of land sought to be purchased. The decision or judgment in either case determines who has the right to purchase, there being no perceptible distinction between the two cases.

---

NEW YORK papers are stricken with a sudden spasm of virtue and are shocked at the sad sight of men buying mining stocks; singular, the difference between tweedle-dum and tweedle-dee. 'Tis all right, and perfectly business (according to the New York press), for those men to deal in puts, calls, futures, straddles, railroad, oil, electric and other stocks, the greater part of which represents only a possible, intangible value, but all wrong and deeply deplored to buy mining stocks. Without endorsing the purchase of mining stocks in general or particular, ability is not vouchsafed to the ordinary Western mind to discriminate between the different phases of the gamble. If anything, the odds are in favor of the man who buys the mining stocks. Of course, dabbling in mining stocks is not mining, no more than dealing in wheat futures is cultivating that useful cereal, but why the New York papers should sermonize about the purchase of mining stocks and be silent on other manifestations of the gambling spirit is as much a mystery as their inability to see that the silver question affects their part of the country more than it does any other, and that prosperity cannot come to them till the remonetization of silver, the resumption of the old time demand for supplies of all kinds on the part of the silver miners, and the restoration of the necessary equilibrium in the nation's supply of precious metals and sound money.

## Concentrates.

CRIPPLE CREEK, COLO., district has eight daily papers.

FOUR FEET of snow was reported in Bodie, Cal., last week

SUPT. TREADWELL of the Red Hill mine, Grass Valley, is making arrangements to build a mill.

AT Circle City, Alaska, coal oil is quoted at $13 per case. Dressed lumber is worth $130 per M. feet.

SUPT. DAVID JOHNSTON will shortly resume work on the Spanish mine, near Washington, Nevada Co.

IT is expected in Grass Valley that work at the Allison Ranch mine, Nevada Co., will begin next week.

YOLO COUNTY'S SUPERVISORS have refused the plea of the salaried officials of the Anti-Debris Association to help pay their wages.

THERE were 100 pages in the February issues of this paper—the first time in the thirty-six years of this journal's existence that 100 pages of it appeared in February.

AT Rossland, B. C., last Saturday, an explosion of two boxes of giant powder at the Center Star mine resulted in the instant killing of four men and the fatal injury of four others.

THE United Smelting and Refining Company and the Puget Sound Reduction Company have recently advanced their treatment charges, the former $3 a ton and the latter making a still greater advance.

AT the annual meeting of the Chollar Mining Company last Wednesday 84,433 shares were represented. A. K. P. Harmon, C. Hirschfield, H. Zadig, E. P. Barrett and A. Krauss were elected directors. C. E. Elliot was re-elected secretary and H. M. Gorham superintendent. The company has $13,981 in the treasury.

AN Ogden, Utah, woman announces the finding of a $5 nugget in a chicken. Josephine Co., Oregon, fowls prospect well in flake gold, and Olympia, Wash., hemlock trees are locally credited with fine free gold.

DURING the ninety days ending on the 1st inst., the Napa Consolidated Quicksilver Mining Company show: Gross, $46,029; expense, $24,733; net, $21,255; dividend No. 73, payable April 1, $10,000; surplus, $11,255.

EVERY industry but one is at a standstill. That one is mining. 'Twould be better were other industries in other than a comatose condition, but it is well that even one legitimate industry is in so flourishing a condition.

DURING January and February quicksilver receipts at this port aggregated 5316 flasks, against 3755 in the same time last year. The exports by sea were 4504 flasks, valued at $166,040, against 1573 flasks at $55,789 in 1895.

THE Utica mine at Ward, Colo., claims to have cleared $26,000 in January. It is a close corporation, the same as the ownership of the Utica mine, Calaveras Co., this State, which never makes any claims, but is understood to yield a monthly average profit of $500,000.

AT Perris, Riverside Co., the St. Louis Co., who own the Menefee mine, has put men to work pumping out the shaft preparatory to resuming development work. The main shaft has been sunk over 100 feet and has two drifts, the first at 60 and the second at 30 feet.

THE New Gold Mining Exchange of this city opened its call board last Monday. The first sales were: Grant Mining Co., 3000 shares at 50 cents to 40 cents; Keystone, 200 at $300; Champion, 200 at $12.50 to $12; Thorpe, 400 at 50 cents to 20 cents; Amalie, 100 at $1.75; Providence, 300 at $8; Kennedy, 200 at $12.50 to $12.

THE powder house of the Standard mine, near Burke, in the Cœur d'Alene district, Idaho, blew up late last Sunday night. It contained nearly a ton of giant powder. The shock was felt for a distance of three miles. The immense compressor, one hundred yards from the mine, was badly racked. Fortunately there was no loss of life.

HALE & NORCROSS, Virginia, Nev., miners objected to having Superintendent Ryan superseded by T. W. Tangerman under the new management, and the underground force—twenty in number—quit work. Their action is upheld by the Miners' Union. The new management has ordered that the mine be shut down temporarily.

OFFICIAL statistics of the zinc production in the United States for the year 1895 are given in the report of Special Agent Charles Kirchoff of the Geological Survey. These show the total production to be 89,686 short tons, against 75,328 in 1894. The report says that the year 1895 breaks the record for great product, the maximum in any previous year having been 87,260 short tons in 1892. The increase is particularly evident in the Illinois-Indiana region.

THE present daily number of new mining incorporations at Salt Lake City, Utah, rival the similar Cripple Creek aggregate. The Utah Legislature is now willing to recognize protection to the industry by lowering the proposed tax to 25 cents on each $1000 of the stated capitalization. The Colorado revenue from this source is a handsome one, but unless Utah hurries up it will lose considerable by its proposed revenue measure not being retroactive.

IN the absence of a State mineralogist or mine statistician, State Superintendent of Public Instruction Cutting of Nevada has taken on himself the task of sending blanks to the mine owners and the different county assessors in a laudable effort to get a report of the bullion yield of the State. In this Supt. Cutting deserves the co-operation of every resident of Nevada Nothing attracts more attention from investing capital than reliable official data of that nature.

TIME will develop anything, a mine or a prospect or a competitor to the gold-producing chickens of Josephine County, Or., the eucalyptus trees of Los Angeles, the fir bark of Olympia, or the coal at Rock Springs, Wyoming. Everett, Wash., now announces that last week a calf was killed there in whose stomach was found a gold watch. It is to be observed further that the watch was "ticking time accurately and in good repair," thus differing somewhat from the normal condition of watches unenveloped by bovine digestive apparatus.

THE Virginia, Nev., Miners' Union is the oldest association of the kind in existence, having maintained its organization since the discovery of the Comstock lode nearly thirty-five years ago. When the union was formed Abraham Lincoln was President of the United States, and during his time and for years thereafter the miners of the West were regarded by their co-laborers throughout the country as the most valuable contributors to the general prosperity of the United States by furnishing gold and silver for standard money to maintain the credit and advance the prosperity of the country.

THE first meeting of the new U. S. Debris Commission, as at presented constituted, was held in this city last Monday afternoon, when organization was effected, Col. Chas. R. Suter being chosen president and Capt. Cassius E. Gillette secretary. On Tuesday the Commission again met and granted permits to the Coney mine, near Igo, Shasta county, and the Proper mine at Murphys, Calaveras county. Mine owners of the Gorman and No Chunk, Michigan Bluff, Placer county, and Princess, near Redding, Shasta county, were authorized to build dams, and the owners of the Lone Star mine at Cromberg were authorized to resume work.

A WASHINGTON PRESS DISPATCH of the 19th says: "It has been discovered just what the opposition of the railroad people is to the Mineral Land bill which the California miners desire put through Congress. They want the bill amended so as to except from its operations the land, amounting to some 266,000 acres, which has already been listed, advertised and approved by the Secretary of the Interior, but not yet patented. Senators Stewart and Mitchell will have charge of the fight of the railroad to secure the adoption of this amendment, while both White and Perkins will make the fight in opposition. Senator White will force the issue at the earliest opportunity."

THE following is one of the delightfully exaggerated romances that are floating through the daily press: "W. A. Clark of Butte, Mont., principal owner of the United Verde Copper Co., whose copper mines are located at Jerome, Ariz., is now on a visit to Paris to complete a deal whereby a Paris syndicate will soon own the mines and the properties of the United Verde Copper Co. Mr. Clark has recently, on the part of the company, refused $50,000,000 for this property. This same Paris syndicate has recently bought secretly the big copper mines in Montana controlled by James B. Haggin of San Francisco and Marcus Daly of Anaconda. The price paid was $125,000,000 United States gold coin."

THE report of the operations of the Montana Mining Co. at the Drum Lummon, Montana, mine for the six months ending Dec. 31, 1895, shows that during that time the mills reduced 37,790 tons of ore, yielding in bullion bars and concentrates (assay coinage value) $496,662, equivalent to $13.14 per ton. The actual realized value amounted to $381,401, the difference on the coinage value being $115,261, or 2.33 per cent on the gold, and 52.14 per cent on the silver produced, the average net realized value of the ore treated being $10.09 per ton. The proportionate money value of the precious metals contained in the ore was: Gold 73.87, and silver 26.13 per cent. The total expenditure at the mine amounted to $288,694.

SILVER BULLION produced at the De Lamar, Idaho, mine costs 50 cents per ounce. But it is the only paying mine in the camp, and doubtless every ounce of silver produced in De Lamar, Idaho, costs close on to $1. This is equally true of every silver mining camp in the country and is an eternal answer to those who ask why, at present prices, silver is produced at all. Another answer is because, in a great many instances, considerable work was blocked out in many big mines at the time of the slump, and at considerable expense, and now to realize some value the ore must be got out and treated. Then, too, in other cases, as at Butte, Mont., silver is a bye-product and is profitable at a price that would preclude its production were the ore that contains it mined for silver alone.

WRITING of the South African mining and political troubles, under date of January 27, a Kimberly man says: "The detention of the Reform Committee, for they really are detained, although out on bail, is a serious check to business. The Boer Government knows this, and glories in the fact, and they have put off their trial until April just to cause greater annoyance. There is no reason on earth why they should not be tried next week, but for the fact that Paul Kruger really does not know what to do with them now that he has got them in his power. He knows very well that a Boer jury will convict every one of them, and he knows very well that they will be liable to a long term of imprisonment. But the question with him is whether he dare allow them to be consigned to jail. On the other hand, it is well known that a large section of his burghers are loud in their anger against him, because he did not have Dr. Jameson court martialed and shot. And now that he has allowed the doctor to escape, they are clamoring for the lives of the ringleaders in the Reform Committee. As you are aware, by this time, measures have been taken to confiscate all the property of these gentlemen, but it would appear that they cannot confiscate their movable property, and, therefore, their shares are safe, and have probably by this time been transferred. But the majority of them have valuable immovable property, such as claims, stands and houses, and if these are confiscated many of them will be absolutely ruined."

AN important case, wherein the Carson City G. & S. M. Co. were plaintiffs and the North Star M. Co. were defendants, was decided by Judge Beatty of Idaho in the U. S. Circuit Court in this city last Monday, the decision being read by Judge McKenna. Judgment was for defendants. The properties adjoin each other in Nevada Co., Cal. Plaintiffs claimed that as owners of the Irish-American mining claim they should be paid $800,000 for ore alleged to have been illegally extracted from their ground by defendants, and that defendants be restrained from working therein. The old question of "apex" and "lateral rights" was prominent, plaintiffs claiming that the North Star owners had no right to pass beyond a vertical plane down through surface lines, defendants claiming that the apex of the ledge ran east and west, continuing westward of the crossing. The judge decided that "the defendant may follow its ledge on its descent under the Irish-American claim and to any depth between the perpendicular plane drawn through the east line of its claim and another similar parallel plane crossing such claim at the point fixed as the western terminus of the ledge and westerly from the east end line 2200 feet measured along the straight central line upon the plat, and along the like line upon defendant's exhibit 8; provided that defendant shall in no event pursue its ledge west of a perpendicular plane extended through the west line of its claim." Incidentally, the decision was to the effect that a company could not be called upon to go behind a U. S. patent or its purchases of original claims. The case will doubtless be appealed.

THE following is clipped from the Virginia, Nev., *Enterprise* of the 18th: "The Hale & Norcross situation is unchanged. Superintendent Tangerman is as obnoxious to the miners of Virginia as he was on the day they passed the resolution refusing to recognize him as superintendent of the Hale & Norcross mine. So far Mr. Lynch and his party have not been down the mine. They went on a long drive down the river yesterday and inspected some of the mills. They traveled as far as Carson and it is reported that Mr. Lynch and Mr. Tangerman paid a lengthy visit to Acting-Governor Sadler. The presumable object of their visit was to request Sadler to call out the militia in case any trouble should occur on the Comstock. No trouble is likely to occur, but the officers of the Virginia Union say that the Union will refuse to allow any one to go down to work under Tangerman. They say that the choice of Tangerman was a direct insult directed at the Comstock, as his reputation had been declared unsavory by a whole carload of the most reputable citizens of the Comstock taken down to impeach his testimony during the Hale & Norcross trial. These officers say that if the management were sincere in their expressions, and if they actually wanted to inform themselves as to the character of their superintendent, that all they need do is to examine the files of the *Enterprise* to find damaging evidence. They say that Tangerman was only given the situation to bolster up his tottering character until the Hale & Norcross cases should be finally settled. The Union, in its action with regard to Tangerman, has the support of the mining superintendents of the Comstock, as well as the people generally. Comstock mining superintendents have refused to let Tangerman go down into the mines under their charge and in other ways have refused to have anything to do with him."

## Assaying at Mines and Works in Colorado.*

By H. VAN F. FURMAN of Denver.

In the past ten or twelve years a great advance has been made in the United States in the art of assaying and technical chemical analysis. The assayer or chemist of a decade since would be utterly unable "to hold up his end of the line" in a modern metallurgical works. While rapidity and the ability to execute a large amount of work in a given time have been the points which have seen the greatest development, accuracy has not been overlooked. There has probably never been a period in the history of the business when margins were so small and competition was so great, and hence when greater accuracy was required. In the early days of smelting in the United States the margins on ores purchased were generally large. In those days the shipper did not exercise the same care to check the returns made by the purchasers as at present. Frequently there was no competition, and the seller was compelled to accept what the purchaser would give for a lot. Under the fierce competition and improved methods of the present day all this has been changed.

While it is true that a majority of our best assayers and chemists received their preliminary training in a technical school, the courses of instruction in these schools have hardly kept up with practical progress and the requirements of the times. A graduate of one of our technical schools who obtains a position at a modern works will first have to forget a great deal of that which he has been taught. This lesson having been learned, and habits of precision having been acquired, he will probably become an excellent workman. Should the student in the laboratory of one of our schools be presented with some thirty or forty samples of ore in the morning, with the request that the gold and silver contents of each be accurately determined—the report to be made the same afternoon—he would probably regard the task as impossible. Should the task be undertaken, he would probably become so hopelessly mixed and nervous that his results would have but little value. Such, however, is not an unusual day's work in a modern establishment, and at many mines from one hundred to one hundred and fifty determinations of gold and silver are frequently required in the course of a day. Thirty control samples for gold and silver, each sample requiring at least duplicate determinations of both the gold and silver, are often received in a modern metallurgical works. Seventy-five determinations in the analytical laboratory will not be considered unusual for a modern chemist.

The young graduate, upon assuming a position at a mine or reduction works, will have straightway to acquire system, rapidity and accuracy. The first is absolutely essential, and, until a proper system is adopted and carefully carried out, good results can not be expected. Herein lies a dividing line between the school and shop-work. In the school the student will be given two or three samples, and ample time to obtain his results; in the shop the operator will be given a large number of samples, and required to furnish the results in a limited time. This can be accomplished only by having the work so systematically arranged that a large number of determinations can be carried on simultaneously. In a well-conducted office twenty-five to thirty-five fusions or scorifications will be carried out together. In the same manner a large number of cupellations—from fifty to seventy-five—are usually run simultaneously. In this way the different determinations are carried through the separate steps in series, thus saving a great deal of time and labor.

Rapidity is frequently of the utmost importance. At a mine the miners and ore sorters will frequently have to wait for the assayer's results before proceeding with their work. At a metallurgical works the working of the plant and the quality of the product will often be largely dependent upon the result of an analysis, which must be rapidly performed to be of value.

Accuracy within narrow limits is absolutely essential. When it is considered that over $100,000 may be paid out for ore, etc., as the result of one day's assays at a modern plant, the importance of accuracy becomes apparent. The results obtained in commercial gold and silver assaying, while not scientifically accurate, are probably much nearer the truth than those obtained by any other commercial industry. There is a mistaken idea in the mind of the uninitiated that the fire assay for gold and silver invariably yields results far below the actual contents. This idea is not without foundation, as there must be a loss of precious metals under fire processes. However, in a series of experiments recently conducted by the writer to demonstrate that which had frequently been demonstrated—that these losses were not as great as generally supposed—the loss of silver in the scorification assay was found to be 2.54 per cent, and the loss in the crucible assay was found to be 2.58 per cent. The loss of gold was nominal (scorification 0.8 per cent and crucible 0.3 per cent). In another series of experiments on the assay of base (lead) bullion the silver loss was found to be 1.55 per cent, while the gold loss was trifling. In the fire assay of silver bullion a great number of experiments show the average loss to be about 1 per cent. However, when silver bullion is assayed by the fire method, the losses are always corrected by running a proof assay with each set of determinations. The average loss of gold in the assay of gold bullion is about one part in one thousand, or 0.1 per cent. This loss is invariably allowed for, and corrected, by running a proof assay with each set of bullion assays. As the losses in ore assaying are well known, and allowed for in the purchase of ores by our modern works, they cannot be considered as of serious moment.

The limits of accuracy to be attained will depend largely upon the character of the work. Mine samples do not require as much care as control samples upon which the ore is sold. One determination for gold or silver on each mine sample is usually all that is required. The assayer at a reduction works will frequently receive samples in handling which speed is of more importance than extreme accuracy. As to the allowable limits of variation on control samples, it may be considered as 0.5 ounce silver and 0.1 ounce gold on ores assaying up to 100 ounces silver and 3 ounces gold per ton. However, no exact rule can be given as to the allowable variation. Many samples of high-grade ore will be encountered with which the only safe rule, on account of the variations in individual assays which may be expected, is to run a large number of assays and then average the results. The modern assayer must be a man of judgment as well as of skill.

The sampling of ores and metallurgical products, while not properly coming within the scope of the assayer's work, is a subject which should be thoroughly familiar to the practical assayer. Unless the samples truly represent the mass or lot from which they were taken, the subsequent assays will be valueless. The assayer at a mine or works generally receives the samples already prepared, but there are occasions when he is called upon to take his own sample. Hence the art of sampling should be thoroughly understood by the assayer. As it is not within the scope of this article to take up the subject of sampling, we will begin with the point at which the sample is delivered to the assayer.

The ore sample is usually delivered to the assay office in a sealed bottle, or paper sack, with the assay number plainly marked upon it. The works generally make three samples; one to be delivered to the shipper, one to the works' assayer and one to be held in reserve for delivery to an independent assayer, as umpire, in case of a disagreement between the works and the shipper. Each of these samples has been carefully and indiscriminately cut out of the general sample of the lot, and passed through an 80 or 100-mesh (the latter is now the Colorado practice on gold ores) sieve.

The assayer, on commencing work in the morning, usually has a number of samples on hand. Each sample is taken up by itself, spread upon a piece of rubber cloth, and thoroughly mixed by means of a steel spatula, the pile being finally spread out into a flat layer of about one-eighth inch in thickness. From this layer the assay samples are taken with a small steel spatula, going over the layer and taking a portion on the point of a knife from each part. Care should be exercised here to always dip the knife down to the bottom of the layer, so that each portion will represent the layer from top to bottom. The portion usually taken in Colorado for each gold assay is one-half assay ton.† This is introduced into a twenty-gram crucible, together with the proper fluxes, which consist of litharge, sodium bicarbonate, borax glass, a reducing agent (as flour or argols), or an oxidizing agent (as nitre), according to the requirements, and such other fluxes as may be necessary. The necessary fluxes have to be added according to the mineralogical composition of the ore. It is largely here that the assayer's skill and experience enable him to obtain correct results. According to the method taught in many technical schools, when the assayer is in doubt as to the proper charge, he should run a preliminary assay. The practical assayer has no time for preliminary assays, but must judge the character of the ore simply by eye-inspection; when in doubt, the writer has found that, by placing about half a gram of the ore on a watch glass and vanning with a little water to separate the lighter and heavier minerals, and then by inspection judging as to the minerals present and their approximate amounts, the character of the sample could be determined sufficiently for assay purposes, and with a small expenditure of time. According to the Colorado practice, most gold assays are run by the crucible method and most silver assays by the scorification method. It is hardly within the scope of this article to discuss the reasons for the adoption of these methods, but it is sufficient to say that they appear to give the best results.

After weighing out the gold charges, the silver assays are weighed out, one-tenth assay ton being the general charge. On control samples three or more charges will be weighed out and introduced into a scorifier, together with the proper amount of pure granulated test lead, half of which is mixed with the ore and half of which is added as a cover to the charge. In addition, a little borax glass, and occasionally other fluxes, are added to the charge. In this manner the assayer proceeds with each sample, a convenient system being that adopted by the writer, as follows: The assay number of the first sample weighed out is entered in the assayer's memorandum-book at the top of the page for the day. This becomes Number 1, and, should a duplicate be run, the assay number will appear twice, the duplicate becoming Number 2 of the day's work. In this manner the weighing out is proceeded with, the charges being arranged somewhat as follows:

| | | | |
|---|---|---|---|
| 1, | 2, | 3, | 4, |
| 5, | 6, | 7, | 8, |
| 9, | 10, | 11, | 12, etc. |

According to this system, we always begin at the upper left hand and read exactly as a page of a book is read. Provided the same relative order is always retained, it is immaterial how many changes are introduced into the furnace at a time; they cannot be interchanged, and any charge can at any time be picked out and separated from the others, if necessary.

When a sufficient number of charges are prepared, they are introduced into the furnace for fusion or scorification. When the fusion or scorification is finished, the charges are removed from the furnace and poured into conical iron moulds, the same relative order being retained. As soon as the slags and buttons have cooled, which generally requires about fifteen minutes, the lead buttons are removed from the slag and pounded on the anvil into cubes. Each cube of lead is now introduced into a hot cupel in the muffle furnace, and the door is closed until all begin to cupel, when it is opened, and cupellation is continued until the buttons brighten, thus showing the elimination of the base metals.

As has been remarked, the Colorado practice is to run the gold assays by the crucible method, the fusions being performed in the muffle furnace, and the silver assays by the scorification process. When this method is adopted, it is customary to add a small piece of pure silver to the gold crucible assays, in order to insure the parting of the button. The gold-silver beads, resulting from the gold assays, are flattened by a few blows of a hammer on a steel anvil, and are then parted for their gold contents. The method of parting generally adopted consists in introducing the flattened button into a small porcelain crucible, adding dilute nitric acid, and heating until action of the acid apparently ceases. The solution of silver nitrate is poured off, strong nitric acid is added, and the buttons are boiled for four minutes. This solution is then decanted off, and the gold is washed twice with distilled water, and, after drying and annealing, is weighed. The balance used for this purpose will weigh to at least 0.01 milligram, and should be used only for this purpose. The silver-gold buttons resulting from the scorification assay are removed from the cupel, brushed with a stiff bristle brush to remove adhering particles of bone-ash, etc., and weighed, the gold as obtained in the crucible assay being deducted, and the difference being the silver assay of the ore.

Such, briefly, is the work required of the assayer, although, if employed at a smelting and refining establishment, he will be required, in addition to the ore assays, to make assays of base bullion, mattes, slags, dore bullion, silver and gold bullion, by-products, etc. Each of these assays requires special methods, which it is unnecessary to discuss further than to say that the same accuracy and care are essential throughout.

The form of report to be handed in by the assayer will depend largely upon the system adopted by the works. An admirable system adopted by one of our prominent reduction works is this: The samples delivered to the assayer are marked simply with the assay number of the lot, and each afternoon the assayer fills out his report containing the assay, or works' lot number, together with the results on each number. Under this system the assayer does not know, nor has he any interest in, one sample above another. This system also enables the management to check the assay returns at all times and without the knowledge of the assayer. At another establishment, where a number of men are employed in the assay office and laboratory, a different system is adopted. Here all samples are delivered to a head assayer, who examines each, marks it with the constituents to be determined, and remarks as to the general character of the sample. The samples are then turned over to the assayers for the proper determinations.

---

THE metric system is the legal standard for weights and measures all over the world, except in the United States, Great Britain, Turkey, Denmark, Russia and Japan. We annually lose considerable trade with the other countries through the persistent use of the English weights and measures by our manufacturers and merchants in their circulars, catalogues and price lists. These catalogues and price lists are unintelligible and useless to foreign buyers.

---

* By permission from *The Engineering Magazine*.

† The Assay-Ton System of Weights was devised by Prof. Chas. F. Chandler of Columbia College. As there are 29,166.6 troy ounces in one ton avoirdupois (2000 pounds), the assay ton contains 29,166.6 grams; hence, if one assay ton of ore is taken for assay, and the resulting button weighs 10 milligrams, the assay value of the ore will be 10 ounces per ton. One ounce per ton is 0.00343 per cent.

## Tributary to Yuma.

**Present Conditions in Southwestern Arizona and Southeastern California.**

To THE EDITOR:—The mining interests of the section tributary to Yuma are receiving considerable attention, not only from local capitalists, but from Eastern States. There are several promising fields for the investor both in southwestern Arizona and in California. One of the latest transactions in this section is the purchase of the Thomas mines by C. D. Lane and others of Angels, California. This mine is one of the most promising in the southwest. It is twenty-five miles southeast of Yuma.

There are some other enterprises hereabouts of less prominence, but the field of greatest activity is on the California side of the river. The Duncan mine at the Pot Holes is being developed. An inclined shaft is now down 150 feet in a vein the width of which is not really known, the shaft being all in ore, and sunk on the footwall. No mill will be built until the development of the mine warrants it.

In Picacho district a score or more of Mexicans are "dry washing." From a responsible person I learn that the average earnings are about $1 per day per man. As a rule, they work only five or six hours and spend much of their time resting. It was here that a pumping plant was installed two or three years ago. It proved a dismal failure. The pumps were unsuited to the work. It would be a much better plan to screen the gravel and haul it to the river.

Several lode locations are being developed by Hon. S. W. Dorsey of Denver, who has purchased a group of claims surrounding the old Jayne mines. The latter were worked several years ago, some of them being over 200 feet deep. The rock was all hauled to the fifteen-stamp mill on the Colorado river, five miles from the mine and crushed. It is said that the rock returned about $9 per ton. The mill is still in fair repair and could be put in shape to run at small cost. There is, however, no immediate prospect of a resumption of operations on the Jayne mines. Senator Dorsey will develop his newly acquired mines; and if the result is satisfactory, Picacho will become a lively camp. The gold-bearing ledges occur here in altered country rock (mica schist, hornblende schist and diorite), vein quartz being rarely found, and, where encountered, almost destitute of gold. The ore is heavily stained with red, brown and yellow iron oxides. Some of the ore bodies are very large, though low grade.

About three miles east of Picacho basin is what is called White Gold basin. There are numerous veins in this section also; but, like those in the Picacho basin, are zones and lenses of crushed country rock, which here are diorite, felsite and other intrusive rocks. These zones lie in a system of parallel fissures joined by cross fissures similar in character. In one of the lodes the mineralization on the surface is more than 100 feet wide, and can be followed several thousand feet along its strike. The gold in this zone is alloyed with silver to such an extent as to give it a silver-white color. A great deal has been said about the rarity of this metal, its enhanced value, etc., but merchants and others in Yuma pay about $12 to $13 per ounce for it. The lode is known as the Oro Blanco (White Gold), and is one of the strongest in the district. Another zone of great width and continuity is the Golden Sunshine. The gold in this lode and in fact in all the others, except the Oro Blanco, is higher grade and consequently yellow.

The region is a very interesting one. The hills are almost entirely destitute of vegetation, and the rock exposures are all that one could ask. The older crystalline schists have at one time been overlaid by masses of rhyolite and tufa to a depth of several hundred feet. Of the vast field only a few outlying remnants are left. No mineral deposits of value have as yet been found in the rhyolites or tufa. They resemble the liparites of Calico somewhat. Further southward the rhyolites are overlaid by a later formation of andesites and black eruptives ranging from augite andesite to true basalt.

In the Cargo Muchacho mountains there is considerable activity in the neighborhood of the Golden Cross mine. Colorado capital has been interested and several vertical shafts are being sunk in the hanging wall country of the Golden Cross Company's deposits, with a view apparently of depriving that company of the right to follow their ore shoots beyond their side lines. The prospect for lengthy and expensive litigation is excellent. No suits have been commenced, but they will surely result if the newcomers attempt to extract ore from any of the deposits now being operated by the Golden Cross Company.

The gold-bearing deposits occur as impregnated masses in the country rock, which is normally hornblende and micaceous schist. These rocks have become very silicious, as a rule; the hornblende has altered into chloritic scales and epidote.

A slight incrustation of copper carbonate and chrysocolla is noticed at many points, particularly near the surface. The whole formation has been cut by a perfect network of coarse granite (pegmatite) dykes, which in some parts of the mine are gold-bearing.

These zones lie parallel, or nearly so, conforming as far as known with the dip and strike of the country rock. The shoots, however, lie in a series of swells, which make up into the hanging wall, being thickest at the middle and thinning out in either direction along the strike of the lodes. They occur at varying distances of 100 or 200 to 1000 feet, so that a line drawn at a right angle to the strike of the formation may pass through several of these shoots. The Golden Cross Company has two stamp mills, the old one of forty stamps, weighing 850 pounds each, and a new mill of one hundred stamps, weighing 1000 pounds each.

Claims are staked out all over the hills of the vicinity, and hundreds of acres have been taken up on the desert wash. Only one company is in operation besides the Golden Cross, and that is a Colorado concern, sinking a vertical shaft in the hope of finding the Golden Queen shoot within the lines of their own claim. The result will be watched by Californians with much interest. CALIFORNIA MINER.

Yuma, Ariz., March 16, '96.

## An Argument for an Appropriation.

On the 4th inst. Hon. Tirey L. Ford appeared in Washington, D. C., before the Committee on Rivers and Harbors of the House of Representatives in an appeal to them to recommend the $250,000 asked for by the California Miners' Association. Mr. Ford said:

GENTLEMEN:—In compliance with the request of your honorable chairman, I wish to submit a brief statement relative to the wishes of the people of the State of California concerning an appropriation to be expended in accordance with the provisions of the so-called Caminetti act, and to meet an appropriation of $250,000 made by the State of California for the purposes referred to in the act.

The act of October 1, 1888, entitled "An act for the investigation of the mining debris question in the State of California," authorized an examination of that question by three officers of the Engineer Corps of the United States Army, acting as a commission for the purpose indicated. This commission made the required examination, and filed its report in February, 1891. This report was in due course transmitted to Congress, and on February 21, 1891, was referred to the Committee on Mines and Mining of the House of Representatives, and is known as Ex. Doc. No. 267 (H. R.), 51st Congress, second session. This report sets forth the points at which storage basins can be constructed and gives detailed information in that regard.

One of the sites designated by this commission for the construction of a restraining barrier is at De Guerre Point, on the Yuba river, several miles above its junction with the Feather river, which latter is a navigable stream. The recommendation in this regard will be found on pp. 17 and 18 of the above Ex. Doc. 267.

Following this report, which is quite exhaustive in its nature, came the passage of an act entitled "An act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893, and commonly known as the Caminetti act. This act recognizes the sediment-carrying quality of the streams which drain the western slope of the Sierras, and provides for the construction of restraining works and settling basins to prevent the debris from reaching the navigable streams, the provisions of that act in this regard being contained in Secs. 23, 24, and 25 of the act.

Sec. 25 of the act specifically provides for the construction of the necessary works and contains, among other provisions, the following: "The recommendations contained in Ex. Doc. No. 267, 51st Congress, second session, and Ex. Doc. No. 98, 47th Congress, first session, as far as they refer to impounding dams or other restraining works, are hereby adopted, and the same are directed to be made the basis of operations."

Ex. Doc. 98, 47th Congress, first session, above referred to, is a report made by Col. Mendell, of the Corps of U. S. Engineers, under the provisions of the river and harbor act of 1880. This report is similar in effect to the report contained in Ex. Doc. No. 267, 51st Congress, second session, above referred to.

The policy of Congress is thus clearly and unequivocally stated. Sec. 24 of the act of March 1, 1893, above referred to, invites co-operation by the State of California with the General Government. Acting upon that invitation, the Legislature of the State of California, at its session in 1893 (see Stats. Cal., 1893, p. 339), appropriated the sum of $250,000 to be used for the purpose of constructing settling basins and restraining works but the appropriation was made upon the condition that none of it should be used until Congress had appropriated at least as much for the same purpose. This act was passed in March, 1893, and is still in force. The people of California having thus acted upon the invitation extended to them by Congress, and having shown their good faith by an appropriation of $250,000, now ask Congress to appropriate at least as much, and thus create a fund of $500,000 to be used for the protection of the navigable rivers in California in accordance with the provisions of the Congressional act of March 1, 1893 (the Caminetti act).

This committee must bear in mind that the damage heretofore done to the rivers in California through the flow of detritus from the mountains has been from several causes. Nature is continually washing the mountains down into the valleys, and this has been greatly accelerated since the advent of civilization. The denudation of the mountain sides of the heavy forests that formerly grew upon them has permitted the soil to become loosened and thus more rapidly wash into the canyons. The grazing of vast herds of cattle and sheep and other stock upon the mountain sides has also accelerated the washing away of the soil. Farming and gardening have added somewhat, and mining has also done its share towards carrying debris into the canyons and rivers. No one cause is wholly to blame. It is impossible to take care of the debris resulting from one cause without at the same time taking care of the debris resulting from all causes. The proposition is to impound this debris at convenient places in the lower foothills and in the canyons where nature seems to have provided places especially adapted to the purpose, and thus relieve the rivers from the annual danger arising from the melting snows and freshets at spring-time.

The theory is that the Government should take care of its rivers. This can be more easily done by preventing the debris from reaching the rivers than by dredging it out after it has reached the rivers.

If it be said that these works are indirectly in aid of a private industry, the answer is that the protection of the navigable streams is a public and national matter, and that the Government in thus protecting its navigable rivers unavoidably impounds the debris resulting from such mining operations as may be permitted by the Federal engineers. But to compensate the Government for the use of its works by any miner who desires to use the same and who can get permission so to do from the Government engineers, it is provided that the miner using such works shall pay to the Government three per centum of the gross output of his mine. Furthermore, California has already appropriated the sum of $250,000, thus relieving the Government to that extent. That there is need of this work for the protection of the rivers of California there cannot be the slightest question, and the mere fact that it may indirectly aid a private industry is no argument against the work, especially when that private industry is made to bear the burden which it creates, and when, furthermore, the State of California is bearing half expense.

Let me say, in conclusion, that this appropriation is a present and pressing necessity whether hydraulic mining be permitted to be carried on in the future or not. The debris already in the canyons should be taken care of, and there is a specific recommendation to this extent contained in the report of the California Debris Commission made to the House of Representatives in December, 1893, as contained in Ex. Doc. No. 16, 53d Congress, second session. The report of the commission in this regard reads as follows: "In regard to the provisions of Sec. 25 of the act of March 1, 1893, in which the recommendations contained in Ex. Doc. No. 267, 51st Congress, second session, and Ex. Doc. No. 98, 47th Congress, first session, are adopted by Congress and directed to be made the basis of operations, the commission desire to say that the restraining barrier described in these documents, situated at or near De Guerre Point, on the Yuba river, is considered an advisable construction to be soon undertaken for restraining the detritus now in the bed of the streams and in furtherance of the project for the improvement of the Sacramento and Feather rivers; a suitable appropriation for this work will be $300,000."

I would suggest the following item be inserted in the river and harbor bill when finally made up:

"For the construction of works for the protection of the Sacramento and San Joaquin rivers in California, two hundred and fifty thousand dollars; such work to be constructed under the direction of the Secretary of War and in accordance with the provisions of sections twenty-three, twenty-four, and twenty-five of the act entitled 'An act to create the California Debris Commission and to regulate hydraulic mining in the State of California,' approved March 1, 1893."

In accordance with the request and in conformity to the unanimous endorsement of the entire California Congressional delegation the committee recommended that the amount asked for—$250,000—be placed in the regular appropriation bill.

## Diplomatic Mr. Grove.

In these days of "booms," "promoters," sales and purchase it is of interest to note the manner of procedure of some of our friends in foreign parts. Recently the Rhodesia Limited amalgamated with the Buluwayo Mining and Finance Co. At a meeting of the former company in London on the 14th of last month the consolidation was ratified, and Mr. Grove, who had conducted the negotiation, made a speech. Among other things Mr. Grove said:

The environment of this company is, to a very large extent, Scottish. I need hardly say, therefore, that its primary virtue is caution. When I was requested to go out to South Africa to look after your interests, the principle of caution was instilled into my mind. I was told to be "verra" careful of what I bought. I was further told not to give more than 6d. unless I was "verra" sure that I could get is. for it. On those wholesome sound principles I ventured to work while I was in South Africa. Well, I spent some little time in Johannesburg before I went north in Rhodesia, and I should like to say in passing that the views upon Rhodesia held there are of a distinctly pessimistic nature. I spent some time in Johannesburg, and I was thoroughly saturated with what I may call a pessimistic bath, but I paid no more attention to the views of Johannesburg than I would to the personal verdict of one lady upon another lady's charms. In fact, the more Johannesburg ran down Rhodesia, the more beautiful and charming was I prepared to find her as soon as I reached her borders. In that cautious attitude of mind I found myself in Rhodesia, and there I am bound to say to be fair that I thought at first the views of the country expressed there were unduly optimistic; but although my stay there was not very long, before I left that country, to put it cautiously, I arrived at the distinct opinion that the optimism of Rhodesia was far more justifiable than the pessimism of Johannesburg. At that conclusion I arrived, after very careful and minute enquiries. Well, gentlemen, to come immediately to the point. As soon as I got to Buluwayo—after six days of traveling night and day, for which I think the sum of £1,000 ought to be voted to me on the spot—I arrived there, and I found a number of properties ready, and waiting to be offered to me. They had heard that a representative of one of the strongest groups in London was coming out to Rhodesia, and those who had properties settled upon me with the same alacrity as flies do upon honey on a hot day. Therefore, I had to bear in mind the caution I received before I went, to be very circumspect in the sifting process I went through before deciding upon any particular property that was offered to me. I may say that after very careful local enquiries, I came to the conclusion that there was no property of equal intrinsic value in the market as that of the Buluwayo Mining and Finance Co. I, therefore, approached them cautiously with my nose somewhat in the air, and if I found my nose was in the air, I found theirs was in the air somewhat higher; for on enquiry I ascertained that they proposed coming to London and expected to raise something like £350,000 from the public on the two properties that they were prepared to offer. The sum of £350,000, gentlemen, is a large sum. I wanted to get that property, but I knew that Rhodesia, Limited, could not offer them that amount, so I set to work—I will not say in an underhand way, but in a diplomatic fashion—like Mr. Chamberlain, combining diplomacy and straightforwardness. After some little negotiations, which cost me several dinners and more than one fit of indigestion, I made the proposal that instead of paying them down a certain sum, we should amalgamate, subject to the approval of our board and shareholders in London. They, knowing the position of Rhodesia, Limited, were somewhat taken with this proposal, but they still opened their mouths too wide, they wanted more than £100,000, in return for their property. I said that was quite impossible. From that moment, when I saw that they were agreeable in principle, I set to work to chip down by several progressive stages the amount we should be obliged to offer them. In the first place I had to deal with the local representative in Buluwayo. I thought to myself I would first of all chip a piece off them, and I succeeded in doing so before I left Buluwayo. Then I got to Johannesburg, where there was a local board, and I began new treaties, with a view of getting another clip off the price before I left Johannesburg. I did succeed in getting a successful clip off, and then we had to meet the representative in London, and they were again subjected to a third clipping process, which has resulted in bringing down the price to what I think is the extremely moderate figure of 60,000 shares of Rhodesia, Limited, and £10,000 in cash.

Mr. Grove certainly appears from his own confession to be justly entitled to the hearty vote of thanks accorded him by the board of directors.

# Electrical Progress.

## Experience with the Electric Locomotive in Baltimore

By LEE H. PARKER.

After a short period of experimental work, electric locomotive No. 1 on Aug. 4, 1895, took up the regular freight service through the Belt Line tunnel of the Baltimore & Ohio railroad in the city of Baltimore. A brief restatement of the reasons for adopting electricity in this tunnel will not be out of place.

The tunnel, which is the largest "soft dirt" tunnel ever built, extends from the present Camden passenger station of the Baltimore & Ohio railroad, a distance of 7350 feet north under the heart of the city. Beyond the northern portal, the Belt Line continues through a series of short tunnels and cuts for a distance of about five miles, where it joins the old main line. The main tunnel has an up grade of 0.8 p. c. going north. The heavy work that would be required of steam locomotives hauling freight trains up this grade would occasion the filling of the tunnel with so much gas and smoke as to seriously interfere with the passenger service. To show how true this is, it may be said that before the electric locomotives were put into service a few freight trains were run through the tunnel, but the result was that several men were asphyxiated, and it was therefore determined not to commence even a part of the regular freight service until the completion of the electric equipment.

The illustration (Fig. 1) gives an idea of the location of the tunnel and of what its use accomplishes. By its means a reduction of sixteen minutes in the running time of the "Blue Line" trains between New York and Washington is now made possible and it is probable that this saving will be increased later on. Moreover, all delays in winter due to ice in the river are done away with.

Shortly after locomotive No. 1 had been put into service, and had given an exhibition of its ability to haul the heaviest freight trains, it became a matter of general interest as to how much it could pull and how fast it could go. The locomotive was, therefore, given a trial at hauling several of the passenger trains at high speeds, which it did satisfactorily to all concerned. As the conditions for operating the passenger trains entirely by the electric locomotive could not, on account of track facilities, be perfected until the new Mount Royal station, at the northern portal of the tunnel, was completed, it was decided to operate them in the meanwhile by coke burning steam locomotives. The new Mount Royal station will be ready in April or before, and preparations are now being made to then operate all trains, both freight and passenger, by the electric locomotives.

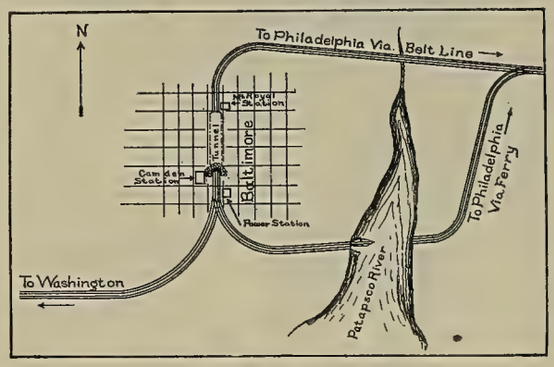

FIG. 1.—B. & O. TUNNEL.

It was shown, from the few trials made with passenger trains, that not only could the guaranteed speed of thirty miles an hour be attained, but speeds of thirty-five and forty miles, with 500-ton trains, were possible. An exhibition of high speed was made with the locomotive running light up the 0.8 p. c. grade, and a speed of sixty-one miles per hour was attained for a short time, without the slightest trouble from trolleys or motors. Several of the many exhibitions made by the locomotives in pulling heavy loads have been described in the newspapers. Probably the most striking was when two trains were coupled together and hauled through the tunnel. For some reason the freight trains had become "bunched" on the Washington division, and when they did get through they came so fast that it was decided to have the electric locomotive haul them two at a time. The first composite train, therefore, consisted of forty-four cars, loaded with coal and lumber, two regular steam freight engines and a steam "pusher" engine. The whole weight was approximately 1900 tons, and was equivalent to about fifty-two loaded cars. The steam locomotives did no work to assist the electric locomotive. The start was made easily and gradually, but when the train was in the tunnel and entirely on the grade the steady, heavy pull was too severe on a defective coupling near the head of the train, and it parted. After coupling together again, the electric locomotive started the heavy train, with all drawbars stretched—no slack in the train—and accelerated it to a speed of twelve miles an hour, without slipping a wheel, and in every way with the greatest ease. It reminded one of the start of an ocean steamship, so noiseless was it and free from any manifestations other than those of mighty power. The current recorded on the ammeter was about 2200 amperes during the acceleration period, and after the train was up to speed it settled down to about 1800 amperes. The voltage on the line was 625. By reading the amperes we were able to readily compute the drawbar pull, and found it to be about 63,000 lbs. All four motors were in series, and we were, therefore, getting the maximum pull for that current.

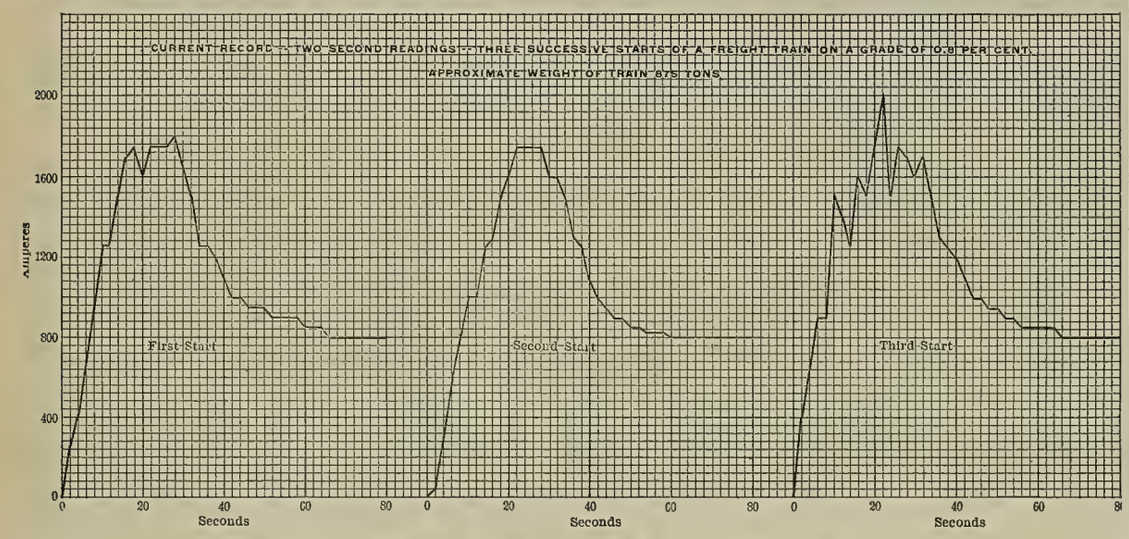

FIG. 2.—DYNAMOMETER DIAGRAM, B. & O. ELECTRIC LOCOMOTIVE.

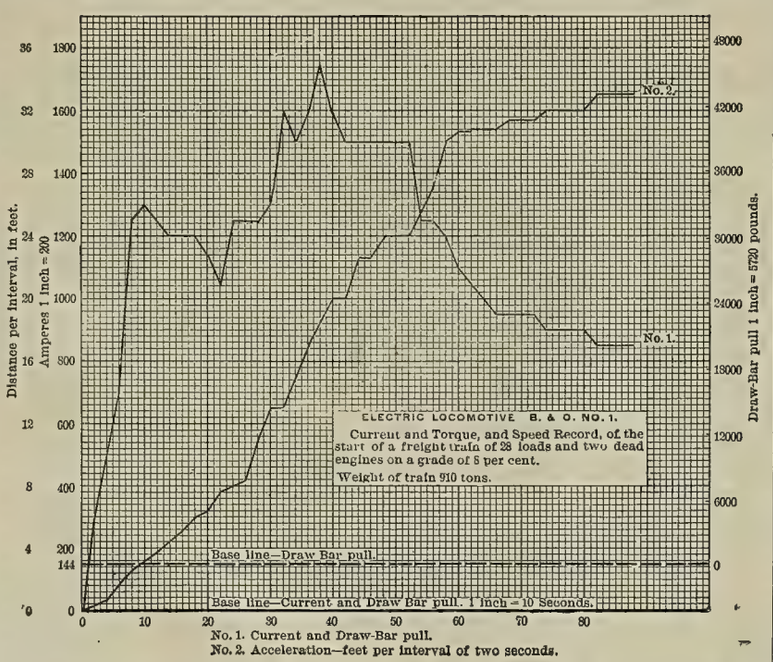

FIG. 3.—DYNAMOMETER DIAGRAM, B. & O. ELECTRIC LOCOMOTIVE.

When no drawbar pull was recorded the pen rested on base line No. 1. The height or ordinate of the irregular curve at any point represented the drawbar pull at that instant. Measuring the same in inches and subtracting a constant and then multiplying by 4000 gave the drawbar pull in pounds, i. e., every inch in height represented 4000 pounds. The paper traveled under the pen at a rate proportional to that of the train. An irregular line marked No. 2, above the base line, was the planimeter record, from which was determined the mean pull for any time. Having, then, the velocity, or the feet per minute, and the mean pounds pull per minute exerted during any period, we readily obtained the H. P. developed.

Another line on the diagram showed the chonograph record, each of the small offsets in the line occurring every five seconds. For every hundred feet the train moved the paper moved an inch. The distance in inches between any two of these offsets gave us readily the velocity of the train. Another line represented the time readings of current and voltage which were taken in the locomotive, a push-button in the locomotive being electrically connected with this recording apparatus. These readings were numbered, so it was easy to tell the current at any time and location. Still another line showed a record of the different stations in the tunnel. From this we determined the location of the train at any time.

The first test showed (*a*) how the start was made on the down grade leading to the tunnel; (*b*) how, after the train was fully started, the drawbar pull dropped off; then (*c*) how it gradually increased as the train came on to the 0.8 p. c. grade in the tunnel; and (*d*), after the train was wholly on the grade, how even the pull was, until near the stop, when the grade increases to 1.2 p. c. Mr. Dunbar, the official of the Pennsylvania Railroad Company in charge of the car, showed some diagrams of steam locomotive work under similar conditions, and it was seen that their amplitude of vibrations was considerably greater than those of the electric locomotive. This was undoubtedly due to the absence of the angle crank on the electric locomotive, and because its pull is uniform throughout the entire revolution of the armature. Most of the vibrations of the pen shown on these curves were due to vibrations of the dynamometer car, which was mounted on a single truck.

From test No. 1 we obtained the

total drawbar pull in pounds, and, knowing the weight of train, we found the drawbar pull to be 22 ± lbs. per ton of weight. Subtracting the grade pull which, in the case of an 0.8 p. c. grade, is sixteen pounds, we obtained 6 lbs. per ton as the train resistance. This confirms the usual allowances made for freight train resistance. These observations were taken in September, 1895, on a hot day. During the past winter months the train resistance has increased, due, no doubt, to greater journal friction caused by thickened lubricants, and we find it to be from our records about 20 p. c. to 30 p. c. greater than in September.

Test No. 2 was made after we had switched off six cars. The run was made under similar conditions and the same character of observations were made. The difference in drawbar pull of the two trains would naturally be the drawbar pull necessary for the six cars switched off. We had their exact weight and were thus again able to find what the drawbar pull per ton was. It was a check on our first figure and was very close to it, the slight difference we found being due to one brake on the six cars being partially set during the first run and unknown to anyone.

We had the readings of current during the first run, also during the second. The difference of these should show the current required to haul the six cars switched off. Dividing the difference in the drawbar pulls recorded in the two tests, by the difference in current recorded, gives us directly the net drawbar pull in pounds per ampere of current. This was 28.6 lbs.

It will, of course, be noted that by this method we eliminated the current required to drive the locomotive. To determine how much this was, and to check our conclusions, we divided the drawbar pull in pounds recorded in the first test by 28 6 and thus obtained the current that should exert that net drawbar pull. Subtracting this current from the current actually recorded on the locomotive would give the current required to drive the locomotive. We found it took 144 amperes. As a further check we figured similarly for the second test and obtained precisely the same, i. e., 144 amperes. So at any time now when hauling a train with the four motors in series if we take the current indicated on the amperemeter and subtract the 144 amperes needed for the locomotive, and multiply the remainder by 28.6, we have the total net drawbar pull in pounds, and if we divide this by the drawbar pull per ton we get the tons of load we are pulling.

From the results obtained above we were able to show the current and drawbar pull at any moment while accelerating a train. The curves (Figs. 2 and 3) explain themselves very fully.

The acceleration curve, Fig. 3, was obtained in a rather humorous manner. It was necessary to have a means of marking the location of the locomotive at the end of every interval of two seconds. It was first attempted to count the number of incandescent lamps passed in each interval, as they are fifteen feet apart, but it would often occur that the interval would end when the pointer was at some position between two lamps, and therefore it was impossible to estimate accurately how far we were from the next lamp. Some one suggested dropping something as a marker on the track at the expiration of each interval. That suggestion was followed by a large number of others as to the nature of that "something." The roadbed in the tunnel is very dark colored in the dim light and is rock ballasted, consequently the "something" should be light colored, non-breakable, and what would not bound out of place when dropped. Someone then suggested a handful of flour. This was adopted and it was soon tried. It was all right for slow speeds, but at sixteen feet a second it was impossible to prevent it from blowing away. Having procured a large supply of flour, perhaps twenty pounds, and wishing to make use of it somehow, someone volunteered the suggestion that flour and water made dough and that a doughball was light colored and that it would not bound, etc. It was decided at once to use doughballs and they were the markers used in determining the distances traveled in each interval, as showed on the curves in Fig. 3.

When it comes to a comparison of the economy of electric and steam locomotives, it is readily seen that it is a difficult undertaking, knowing, as we do, the figures of only a single isolated electric plant operating under special conditions and for a comparatively short time. One great incidental advantage of electric locomotives in tunnel service is that they are smokeless. This is an important moral consideration, but one which can hardly be computed in dollars and cents. But it may be of general interest to know how the actual operating expenses per engine mile of the electric locomotives during October, 1895, compare with those of a prominent and large Eastern railway for the same month.

For the operation of the Baltimore & Ohio tunnel power house for the month of October, 1895, the itemized expenses were as follows:

| | |
|---|---|
| Labor | $1,345 70 |
| Coal ($1.35 per ton) | 400 96 |
| Oil and waste | 151 26 |
| Water | 50 66 |
| Maintenance | 25 42 |
| Total | $1,974 00 |

The expense on electrical locomotives was:

| | |
|---|---|
| Motor engineers | $200 00 |
| Oil and waste | 12 16 |
| Total | $212 16 |
| Total expense | $2,186 00 |

There were hauled through the tunnel 353 trains.

| | |
|---|---|
| Average weight of train | 1,095 tons. |
| Average time of trip | 21 minutes. |
| Average current | 986 amperes. |
| Distance of trip | 4 miles. |
| Total engine travel | 1,412 miles. |
| Total engine travel—"idle" | 3,756 miles. |
| Actual time consumed for above service | 118 hours. |
| Idle time for month | 626 hours. |

It is customary to consider an engine with steam up as equivalent to six engine miles for each hour it is idle, so that, for comparison, the actual mileage made by the engines must be increased 6×626=3756 miles.

The large charge of labor at power house will be the same for one, two or three locomotives in service. The items, coal, water and maintenance, and the expense on locomotives, increase with the number of locomotives in service. If we assume this increase to be proportional, the total expense and cost per engine mile are as follows:

| | Total cost. | Engine miles. | Cost per engine mile. |
|---|---|---|---|
| For 1 locomotive | $2,186 16 | 5,168 | $0.424 |
| For 2 locomotives | 2,875 36 | 10,336 | 278 |
| For 3 locomotives | 3,564 56 | 15,504 | .23 |

The steam railway records referred to above are for October, 1895, and may be briefly abstracted as follows:

STEAM LOCOMOTIVE PERFORMANCE.

| | East Div. | West Div. | Central Div. | N. & W. Line. | Entire. |
|---|---|---|---|---|---|
| Locomotives in service. | 74 | 57 | 33 | 28 | 192 |
| Average engine mileage in service | 2834 | 2966 | 2293 | 2305 | 2703 |
| Average cost per engine mile— | | | | | |
| Passenger engines | 1926 | .1666 | .1629 | .1552 | 1765 |
| Freight engines | .2472 | 2656 | 3428 | 2303 | 2615 |
| Switching engines | .1489 | .1650 | .1828 | .1425 | .1577 |
| Work engines | .2391 | 2258 | .2617 | .2169 | .2354 |
| Total engines | .2084 | .2193 | .2121 | .1797 | .2005 |

From the figures given above it is seen that the actual operating expenses of the electric locomotives for that particular month are about the same as for the freight locomotives on the steam railroad, i. e., 23 cents per engine mile. The service of the electric locomotives at that time was only about one-third that which it is expected they will have to do when the passenger service is taken up and the line extended the full distance.

As originally intended, a method of using to advantage the power of the station while the electric locomotives are idle is soon to be incorporated in the plant. Under the new conditions the cost per engine mile for the electric locomotives will be far under that of steam.

A comparison of the efficiencies of steam and electric locomotives shows slightly in favor of the electric. Observations made on French railways and on the Pennsylvania Railroad show that about 45 to 55 per cent only of the I. H. P. of steam locomotives is applied to hauling trains. The efficiency of the Baltimore and Ohio plant is in the vicinity of 60 to 65 per cent under normal conditions.

A word may be added as to our experience with the overhead conductor system. The conductor in the tunnel has now been in position for nine months. During all of this time coke-burning locomotives have been used for passenger service, with the consequent presence of a good deal of gas and vapor. For the first six months about half of the conductor was constantly wet from the drip due to leaks in the masonry. This occasioned a muddy, slimy deposit over the insulators and a considerable portion of the conductor. The porcelain insulators are almost entirely obscured in some places by this deposit and that of small particles of carbon given off by the locomotives.

Current was first turned on the line about three months after the tunnel structure was erected. The leak to earth was at first twenty-one amperes, but, in a day or two, this dropped to about four amperes—the present leakage. The inside of the conductor was coated with a combined deposit of rust and muddy sediment. Heavy currents were taken from it by the contact shoe only with difficulty and the presence of much arcing, heating and showers of sparks. It was found impracticable to run on this surface. By application of kerosene and frequent scraping with special shoes, a direct contact of the trolley shoe with the conductor was made possible. Although a single contact shoe then worked with little or no sparking, two shoes in tandem were adopted. Their operation through the conductor is smoother, and the contact over muddy portions of it is more nearly positive. At intervals of about three weeks the conductor is treated with kerosene, and brushing shoes are run through it, about one or two trips with these brushing shoes being all that is necessary. This serves to prevent the further accumulation of rust and to remove the sediment from the contact surfaces. An inspection shows a smooth surface over which the shoes run. Contact with the metal is seen to be in high spots and thin lines which are slowly increasing in extent.

No considerable sparking now occurs, except at the wet places, where it is occasioned by the presence of water and sediment. With the exception of three places, about 200 ft. long each, the conductor is at present dry.

The bolts to the arch of the tunnel are both galvanized and painted. They show no signs of rusting. The painting has, in general, protected the surfaces of the conductor and channels. The sides and top of the inside of the conductor are coated with rust. Most of this is hard and close grained, some of it, however, flaky. In no case is there apparent a reduction of thickness of any of the ironwork, due to rusting. Outside the tunnels the conductor is in uniformly good condition. It adapts itself to changes of temperature without trouble. The inside of the conductor is coated with rust, but in no case has there been any trouble from it. The deposit appears to be very light. There was at no time any sparking between contact shoes and conductor outside of the tunnel.

---

A HOPE of Tesla and other electricians is that induction lighting may be made more economical than the incandescent lamp. Improvement in this direction has been sought by Mr. D. McFarland Moore of Newark, N. J., through a sharper and more rapid breaking of an ordinary electric current, and by using a mechanical circuit-breaker in a vacuum tube, placed with an induction coil in a direct current incandescent lighting circuit at 110 volts, he has obtained a brilliant white light in long vacuum tubes without expensive apparatus. The ends of the tubes, which are without electrodes, are coated with aluminum powder. The tubes are normally joined in the circuit by wires outside, but even this is not necessary, as they may be illuminated by being brought near a wire netting in the circuit.

## Scientific Progress.

AN account of what is in many respects the most interesting stellar system yet investigated, supplying a problem in physical astronomy in some respects not inferior to that arising from the action of Neptune upon Uranus, is given in *Popular Astronomy* for March. F 70 Ophinchi is an easily visible equatorial star, hitherto supposed to consist of two components, of the fourth and sixth magnitudes respectively. The apparent orbit is a narrow ellipse, of such size that the two stars can almost always be readily separated by small telescopes. Since 1825 astronomers have been constantly watching this system, so that more observations of it have been recorded than of any other double star in the northern heavens, while it has thus far had more orbits computed than any other. The irregularity of motion has been noticed from the first, and Madler, from measures between 1779 and 1841, even concluded that the law of gravity did not hold good in this system. The last of the computed orbits, based on over 400 observations, was published in 1893 by Prof. Wm. Schur, of Gottingen. This should have proven fairly accurate for many years, but the computed positions have rapidly deviated until an error of nearly five degrees has been noticed; and careful investigation by Prof. I. J. See, of the University of Chicago, shows a regular variation through a series of years in the actual orbit. This can only be explained by the existence of a dark body in the system. The period of the dark body appears to be about thirty-six years, the dimensions of the large orbit being probably midway between those of Neptune and Uranus, and the combined mass of the three bodies being about one and six-tenths that of our sun. Thus the system is a magnificent one.

---

IN the ray lamp of Prof. Woodward of Harvard University, an aluminum cone, with sides one-tenth of an inch thick, is closed at the bottom by a tube and stopcock to permit of the exhaustion of the air, the cone being held to both plate and tube by metallic hoops, and made air-tight by plaster of Paris. The cone is strengthened by a wooden disc on the inside about half way to the top. The cathode pole passes through the glass base a little to one side of its center, and terminates in a platinum disc in a position parallel to the nearest point of the cone. The anode pole is directly connected to the metallic side of the cone at the top. This lamp has been claimed as the first important addition to Roentgen's work, and, by producing radiographs almost instantaneously with induced currents of 25,000 or 30,000 volts, has demonstrated that the Roentgen rays are greatly weakened by passing through the glass of the ordinary vacuum tube. In France, where the greatest enthusiasm has been aroused, G. Moreau dispenses with the vacuum tube altogether by using the brush discharge of an induction coil. A curious result noticed is that no effect is obtained when the box containing the sensitive plate is placed horizontally to the brush, while if placed parallel to the brush, excellent negatives are produced.

---

THE first experiments of Herr Otto Lilienthal in flying were made with a single cloth-covered, wing-shaped framework, which, after a run from the top of a hill, supported him in the air for perhaps a quarter of a mile as he gently slid down the slope. He has since made it easier to keep his equilibrium by using two smaller frameworks, placed one above the other. This apparatus can be kept in position in a wind of twenty miles an hour, and

with a total wing surface of eighteen square meters he has sailed in a nearly horizontal direction against a wind of fifteen miles or more without the run at the start, even being lifted by the stronger winds higher than the starting point, and sometimes coming to a standstill in the air. Such experiences convince him of the possibility of sailing in a circle. As the apparatus would shoot rapidly toward the ground on coming into the wind, it must have sufficient height to complete the turn before landing, and the flapping of small wings may help to gain this.

SOME of the results of the French magnetic survey of the world have been already communicated to headquarters, and these indicate that the complete magnetic map will be a work of great importance. In Iceland two complete observations of variations were obtained, each with a duration of eight days. The seven observing expeditions sent to different parts of the globe will continue in the field about two years longer, making nearly simultaneous observations with the finest instruments.

A PAPER has been communicated to the Royal Society by Lord Kelvin, in which the close relation between an emission of light waves and an emission of longitudinal ether-waves is very clearly indicated. It is believed that every generator of common Hertzian waves also generates the new waves in planes at right angles to the former. This idea has an important bearing upon various photographic results stated to have been obtained without the use of a Crookes' tube.

IN the exploration of the Himalaya mountains in the Nanga Parbat region, which was made last summer, a height of 20,000 feet was attained by the exploring party. The tents used were made of silk. They weighed but sixteen ounces apiece, and formed warm and comfortable shelters with but the minimum of weight to carry.

## Mechanical Progress.

IN Marseilles, France, a railroad has recently been completed which possesses an original feature, viz: Its motive power consists of steam locomotives without fire boxes. This peculiar engine was adopted in order to effect the passage of a tunnel, half a mile long, without development of smoke. The locomotive consists of a cylindrical boiler, which is filled with hot water under a maximum pressure of 227.5 pounds per square inch. At the end of the line the pressure decreases to 43 to 70 pounds. The water is then heated again to 203°, corresponding to a pressure of 227.5 pounds, by means of steam produced by the generators at the central station. The boiler is 10 feet long, 3 8 feet in diameter, and holds, besides 550 gallons of water, 21 cubic feet of steam. The steam from the generators is uniformly distributed through the water by suitably arranged pipes. After having been used in the cylinders, the steam is condensed in a condenser consisting of 1154 pipes, provided over the boiler.—Chem.-Tech. Zeitung.

A NEW safety cartridge, in which quicklime and dynamite are so arranged that the lime in slacking heats a primer sufficiently to fire off the detonator embedded in the dynamite, is being used in the colleries at Polish Ostrau, in Austria. The compound cartridge is enclosed in a bag of loose cotton, woven like a wick. The flame is confined to the interior of the cartridge, and even in a gallery containing seven per cent of fire-damp and clouds of coal dust neither gas nor dust was fired.

ALUMINUM has been successfully electroplated with copper by Mr. Charles Margot of Geneva. The aluminum is first cleaned with an alkaline carbonate, washed in water. It is then dipped in a weak and slight acid copper sulphate solution to give a preliminary deposit of copper, and, after thorough washing, is placed in an electrolytic bath until the coating is sufficiently thick.

TRIAL has recently been made in building operations of a mechanical device known as Pease's tubular construction. It is based upon the simple fact that three tubes, each having an open slit along one side, may be interlocked. Of course the number of tubes that can thus be connected is indefinite. By adding a sufficient number on each side of the three, for instance, a flat expanse like a roof would be formed. In fact, this construction has been used for the roofs, walls and floorings of corrugated iron. Sometimes to obtain greater rigidity the tubes, after being interlocked are filled with concrete. No bolts or rivets are needed. By making the tubes of different diameters, and in other ways, a great variety is introduced in the application of the principle.

THE mine surveyor, before making magnetic obsermations with delicate instruments, is recommended to carefully test his lamp. Composed of various metals the lamp in a hot condition sets up thermo-electric currents which act on the magnetic needle. In order to settle this point six mine surveyor's safety lamps, free from iron, were first placed, one at a time, first in a cold condition, and then heated at the pole of a sensitive magnetometer. Two of the instruments had no action on the needle when cold, but all acted on it when hot. The deviations observed amounted to from 30 to 160 seconds. A new benzine lamp caused a deviation of as much as five minutes. The deviation increased with the temperature of the lamp.

A DEFINITE official statement of the cost of that great engineering work, the Kiel canal, shows the reaching point to have been some $39,000,000. It is about sixty-one miles long, 20 feet deep at dead low water, and 229 feet wide, in numerous places the width increasing to some 428 feet, to allow the largest vessels to pass each other, and work will be continued until vessels of any depth can pass at low water. The embankment is stone-lined to a depth of 6 feet below the water, and the locks at the North sea end of the canal are said to be the largest in the world, with the exception of that at Bremerhaven. Two bridges span it at a height of 137 feet above the water, and there are also six opening bridges and sixteen ferries.

AT the London Imperial Institute recently Col. J. Harris delivered a lecture on "The New British Trade Route to the Pacific." He traced the new route on a map from Liverpool to Churchill harbor (Hudson's bay), and thence to Sea falls and Albert park, joining the Canadian Pacific Railway at Calgary. The distance from port Churchill to Calgary is about 1000 miles, and a saving of 1328 miles over the present route from Liverpool to San Francisco and Vancouver would thus be effected, or, in other words, three days would be saved in going to India, China, Japan and the Pacific colonies. The London *Times* says "the necessity for the new railway was insisted upon as a vital and imperial question."

The London *Pall Mall Gazette* says: "Horseless carriages have run into the market at last. The Daimler Motor Company (limited) has been formed to carry on the manufacture and sale in this country of the Daimler motor, used for carriages, launches, stationary engines, light locomotives, and the like. The capital is £100,000, in 10,000 £10 shares, all now offered for subscription, and of which 6000 are to be allotted for the provision of money for working purposes. The price of the right to use all or any of the Daimler patents here, together with the benefits of further improvements, is 4000 shares, or cash in lieu thereof, and the option of subscribing at par for any unallotted shares of this issue."

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS

AND FOR USE IN

Milling and Mining Machinery
Reduction and Concentrating Works
Woolen, Cotton, Paper and Pulp Mills
Rice, Flour and Cottonseed Oil Mills
Sugar and Malt Houses
Distilleries, Filter Presses
Stone, Coal and Ore Screens
Stamp Battery Screens
Brick and Tile Works, Filters

# Practical Information.

### Incrustation in Gas Engine Jackets.

It is not often that trouble is experienced in gas engines owing to incrustation by lime deposits from the jacket-cooling water, but a case is reported where, in two engines, one of 25 and one of 50-H P., after having been in operation for about a year, different parts, notably the exhaust valves, were frequently found to be very much overheated, the circulation of the cooling water through the cylinder jackets was impeded, and there were often premature explosions of the gas and air charges in the cylinders. On taking the engines apart, it was found that portions of the water pipes leading to and from the jackets, and even in the interior of the jackets themselves, were almost completely choked up with a scaly deposit formed by the precipitation by heat of salts dissolved in the water, the action being in all respects similar to that going on in a feed water heater. Since, however, as shown by thermometric measurements, the cooling water, in flowing through the jackets while the engines were working, never reached the temperature at which lime salts are known to separate from the water which holds them in solution, it became evident that the precipitation must have occurred during the periods just after the engines stopped working.

An unusual case of metallic precipitation is cited in the *Bulletin, Soc. Chim.*, which states that when bright lead is immersed in a solution of lead nitrate containing from ten to four hundred grammes per litre, and protected from access of air, metallic lead is gradually precipitated on it in well-defined crystals, just as on iron or zinc. A certain amount of lead nitrate is produced at the same time, and in weaker solutions forms the exclusive product, being deposited in yellow crystals in place of those of the metal. The lead crystals form plates from one to four mm. in diameter, and are chemically pure, but they rapidly oxidize in air to the hydroxide, so that a crystallographic examination is impracticable. When kept undisturbed in the original liquid, the metallic crystals are gradually converted in a basic nitrate, which crystallizes in large, white tufts of silky needles as much as two cm. in length. The precipitation of the lead is not due to local electrolytic action set up by metallic impurities, for precisely the same result is obtained with pure lead made by reducing, by means of sugar charcoal, litharge prepared from the pure nitrate; moreover, the precipitation does not occur in solutions of lead acetate, as would be the case if it were due to this cause.

Strictly speaking, there is no such a thing as the H. P. of a boiler; but as a boiler is needed to drive a steam engine, the measure applied to the engine has come to be applied also to the boiler. A boiler turns one cubic foot of water to steam in one hour for each H. P.; that is, a ten H. P. boiler turns 62½ gallons, or 625 pounds, of water to steam in an hour. If the boiler is a cylinder or flue boiler, multiply its length in feet by its diameter in feet and divide the product by six. The quotient will be the nominal H. P. To find the nominal H. P. of an engine (not of a boiler), multiply the square of the diameter of the cylinder by 0.7854; multiply this product by the speed of the piston per minute (which is twice the stroke times the number of revolutions per minute), and divide this final product by 33,000; the quotient is the H. P.

Human life is in danger at an elevation of 25,000 feet, and at a considerable lower altitude bodily exertion becomes almost impossible. Birds, on the other hand, rise to an elevation of 35,000 or 40,000 feet, and at such heights sustain great muscular exertions for an indefinite period. In that respect, as in the matter of flight itself, they have a manifest advantage over the best of us.

A new way to mine sulphur is now being used, which lessens the cost of mining very materially and brings up the valuable mineral in a state which renders its reduction into a commercial product much easier. Work is commenced by sinking a well, about 12 inches wide, down to the layer of sulphur; a steel tube 10 inches wide is lowered as the work progresses, and when the yellow mineral is reached a second tube only 6½ inches in diameter is lowered within the larger one. Hot water is then forced down into the annular space between the two tubes, and the temperature of the water is kept up to at least 235° Fahr. At this temperature sulphur will be liquefied, and thus be pumped up at the rate of five tons of the mineral per hour.

A ship's rate is found by a line about 900 feet long, on a reel having one end fastened to a thin sector-shaped piece of wood called a log. The arc of the log is loaded to make it stay vertical when tossed into the sea. It then remains in the same place (is supposed to) in the water while the line is unwinding from the reel. The line is divided into equal parts of fifty feet each, called knots or 1-120th of a nautical mile. Since a half-minute has the same ratio to an hour that a knot has to a nautical mile, the ship runs at the rate of as many nautical miles an hour as it runs knots in half a minute. If, say nineteen knots pass in half a minute, the vessel is then running at the rate of nineteen miles an hour.

In some respects the famous Brooklyn bridge is the most stupendous existing work of human ingenuity and industry. It is 5989 feet long and 135 feet above the water. The piers are 278 feet above high tide. It required thirteen years for erection, being begun in 1870 and finished in 1883, at a cost of $15,000,000. The central span is 1595 feet and 135 feet above high water. There are four suspension cables, each composed of 5296 galvanized steel wires bound together, but not twisted. Its width is 85 feet. Its architect was John A. Roebling, and it was built by his son, W. A. Roebling.

The ancient idea that we owe our digestion chiefly to the stomach is being discarded, Kœning having shown that this organ may be completely removed from the living animal. Other German physiologists suggest that the proper function of the stomach is to render harmless all substances injurious to the bowels, the real digestive organs.

Plans for the construction of an electric plant, by which the Susquehanna river will be used to furnish electric power to towns in Maryland and along the Susquehanna river in Pennsylvania, also points in Delaware, have been completed by the hydraulic engineer who has charge of the construction of the Niagara electric plant.

The greatest depth, writes Prof. Seeley in his "Story of the Earth," at which earthquakes are known to originate is about thirty miles. It has also been calculated that a heat sufficient to melt granite might occur at about the same depth.

## DIAMOND DRILL FOR SALE.

1 Sullivan Hand Prospecting Drill, size M, with full equipment; also extra Carbons and 250-foot Drill Rods, little used and guaranteed in first-class order. Will sell cheap.

NIAGARA MINING COMPANY,

— MANUFACTURERS OF —

For MILL — OR — PLACER USE.

THE GOLD KING AMALGAMATOR.

The only successful device for saving fine free gold from clay, talc or slimy ores. Has been proven far superior to horizontal plates in every instance. Endorsed by leading millmen. Send for catalogue and price list.

MIDAS GOLD SAVING MACHINERY CO., 114 First St., San Francisco.

## The General Gold Extraction Co., Ltd.,

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the Pelatan-Clerici Process recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

Cary Steam Pumps, All kinds of Mining Machinery, Boilers, Engines, Ore Buckets, Ore Cars, Cages, Hoists, etc.
129, 133 & 135 First St., San Francisco.

## MINING PROPERTIES WANTED.

We are in a position to buy and sell. Have a cash customer for a gold or copper proposition. Reports furnished. GRIDE & DOW, 139 So. Broadway, Los Angeles, Cal.

# Mining Summary.

## CALIFORNIA.

### Amador.

LINTON — *Ledger*: Mr. Elmore has purchased the Linton mine in Volcano district from Congressman Caminetti.

The Iron Mass mine which is under the superintendency and management of A. B. McLaughlin, has completed a crushing of ore. They are now drifting on the ledge preparatory to taking out another crushing.

Emerson and Grainger have commenced leaching the old dump at the Cosumnes Copper mine near Forest Home. The dump consists of thousands of tons of ore which have been on the surface over thirty years, and on account of oxidation yields up copper readily with slight chemical treatment, although a large portion of it is still in the form of pyrites. There will be no attempt to go into the mine, operations being confined to the ore which was not smelted when the mine was operated in early days.

The directors of the Jackson Gold Fields have considered the reports of James E. Dye, manager of the property, relative to sinking the shaft at the Amador Queen at least 500 feet deeper, which recommendation was reinforced by reports from superintendents John Ross of the Wildman and Mahoney and J. F. Parks of the Kennedy. The work of sinking was resumed Thursday, the 12th inst.

### Butte.

The pump is running in the Catskill mine at Forbestown. Taking out ore will begin this week.

J. Hendley of Morris Ravine located the claim he is now working in Morris Ravine forty-two years ago and has worked it ever since. His claim has enabled him to pay assessments on numerous other claims that never yielded him a cent. When in want of money for any purpose he goes to work and digs it out. It is a bank that has always honored his drafts, and still continues to do so.

### Calaveras.

The Angels papers give accounts of the alleged sale of the Pure Quill mine to Messrs. St. Clair and Worsley for $100,000, but Harry Rutledge, superintendent and part owner, says they are two bunko men who represented to him that they had just purchased a mine in Colorado for $40,000, offered to buy the Pure Quill, the offer was accepted and the papers drawn up; they and he went to Stockton to meet a man who, they said, would come from San Jose with $12,000, the first installment of the purchase price. The two men borrowed money from Rutledge, who also paid their expenses during their stay at Angels. In the night the men decamped, taking the papers and specimens of ore, and without paying what they had borrowed.

MINING NEWS.—The Calaveras Consolidated group near Robinson's Ferry has been sold by E. K. Stevenot to a company represented by B. M. Newcomb of the Napa Quicksilver Company of Oat Hill, Napa county. Mr. Newcomb, as acting superintendent, will drive the old tunnel in to its full length. Mr. Preston describes the tunnel as placed fifty feet above the river in the footwall slate, and would cut the vein several hundred feet below the collar of the old working shaft. The course of the tunnel, 1400 feet long, was with the formation, north 65° west. The mouth was finished in masonry and timbered for some distance with the elliptical tunnel section, but farther in the width was contracted and given the ordinary tunnel timber sets. The tunnel will be run in at least 3000 or 4000 feet.

The Carley mine, near Altaville, has been taken by a company, of which C. A. Hooper & Co. of San Francisco form the leading spirits. The attachments have been cleared and the company will go down 400 or 500 feet before drifting.

*Echo:* Recently in the Ghost mine ore was struck at a considerable depth which assays over $80 a ton. The mine is under the management of Mr. Drake.

*Chronicle*: The mill at the Moser mine has been shut down, pending the addition of twelve more stamps, making twenty in all. The building of the new mill has commenced.

At the Gwin mine connection has been made with the old works by means of the drilling process, and a very small flow of water was encountered. At present it will not exceed 10,000 gallons per day, which amount can be easily handled, and the work of sinking has been commenced. The last 20 feet of the drilling was through quartz of a good quality, containing a large percentage of sulphurets.

Work on the Hexter mine tunnel is being pushed. The tunnel is 7 feet 5 inches wide and 6 feet 4 inches high, and will be large enough to run a double track. It is claimed for the Hexter that it will open up a mile or more of a gravel channel in addition to the quartz developments, workings from which in the early days and in a primitive manner showed the ledge to be gold-bearing. The developments are being made under the superintendency of Col. W. T. Robinson, one of the owners.

Part of the Emerson ranch, in Happy valley, about a mile from Mokelumne Hill, has been sold. The purchasers are San Francisco capitalists in conjunction with W. T. Robinson. The Emerson ranch is known to contain mineral in large quantities, and an extension of the Moser mine passes through it. Development work will be started in a short time.

Supt. Eaton of the Blair mine informs the *Voice* that work will start the first of April. The company intends putting up a fifty-stamp mill this summer, and is considering the feasibility of using the water power from the Stanislaus by means of electricity. A new shaft will be put in, and sinking will be continued until a depth of 1000 feet is reached.

At the Eureka mine of Drake & Tryon the shaft is now down 180 feet. It has passed the green rock and is now in vein matter, which prospects well and promises better. The shaft will be put down 800 feet. At 200 a compressor will be put in and the sinking continued with Burleighs.

The Turner mine has been rechristened the Indiana, after the battleship of that name. A company has opened it up and will push operations this summer.

J. F. Henry has agreed with H. Craig to bond the Soap Root mine in West Point district for one year from March 1, 1896, for $6000, with the option of purchase at the end of that time; to enter upon, explore the mine, extract and reduce ten tons of ore; if the money is not paid at the expiration of the year, all the property and improvements to revert to the original owner, Henry.

At the Machu mine sinking the shaft and drift and building the hoisting works progresses. Part of the machinery has been placed in position. There are thirty men employed. The mine is worked by the Godbe Co. J. M. Martin of Angels Camp is foreman.

### El Dorado.

(Special Correspondence).—Seymour & Staver are making good headway in their prospecting and development work just above the Big Canyon mine.

Work on the Pocahontas is progressing very satisfactorily. This is an old time property of a romantically rich gold productive history. Water will soon be out of the shafts and then depth will be sought.

A. Harpending has become interested in the old Springfield, and contemplates starting work on the plant at once.

At the Big Canyon mining camp a new school district has been mapped out, and the pedagogue will soon teach the thirty-five urchins in the school house now building.

John Darrow's five-stamp mill, one-half mile below Big Canyon, is hammering out gold day and night. The ore is free milling and averages $4 per ton. The ore body is from 3 to 20 feet.

J. C. Murphy, in the Kelsey district, occasionally does some ground sluicing to uncover a 4-foot ledge. Last week he found a nugget on his sluice fork that carried one-half ounce of quartz, and the nugget weighs fifty-five ounces. Your correspondent had the pleasure of seeing the chunk. This gold yields Mr. Murphy, at the Mint, $18.25 per ounce. This property is in close proximity to the Lady Emma mine.

Placerville, March 18, '96.

### Inyo.

At the Hirsch mine, near Independence, now owned by the Reward Mining Company, the new ten-stamp mill is at work. Supt. Rives states that it crushes twenty tons in twenty-four hours. The ore is brought from the mine by buckets suspended from an endless wire cable. These are attached one hundred feet apart, and hold about one hundred and thirty pounds of ore each. They are arranged with hinge bottoms, and a trip over the ore bin at the mill releases the catch so that the ore drops and the bottom goes back to place as soon as the ore is out. From the bin the ore is shoveled into a rock crusher and passes down to the self-feeders. The slums pass over two six-foot concentrators. Supt. Rives has eighteen men working in the mine, and four at the mill—two on each shift.

### Mariposa.

*Gazette*: At the Dorse mine in the Hornitos district, E. Steuart, the owner, is sinking. Mr. Sullivan, the superintendent, has a dozen men at work.

At the Tyro mine the mill is at present shut down. There are six men at work. Under the present system ore cannot be taken out fast enough to keep the mill running.

At Hite's Cove about 20 men are drifting and cross-cutting. In the west drift things are looking well and the pay ore is coming in.

A Coulterville dispatch of the 18th says that the published report that the Merced Gold Mining Company has closed down is false. The men in one of the three shifts were laid off on the 7th on account of having finished development work. The ore in that shaft is all blocked out ready to be taken out for milling. The mill is running full handed, and steam is up in all their mines.

It is claimed in Coulterville that the cause of the partial suspension of work in the Merced Gold Mining Co.'s mine is connected with the Butte & Boston Co.'s affairs at Butte, Mont., some of whose members are interested in the Coulterville mine. The mine is being kept pumped out and some men are at work while the mill is being run, and no doubt the works will be running again with a full force as soon as the present legal complications are straightened out. Thos. Couch, who has been directing operations in Coulterville, has just been appointed one of the receivers of the attached Montana corporation.

### Nevada.

St. Louis, Mo., men have bought the Texas mine, Willow Valley district. New machinery will be bought and the property developed. J. T. Smith of this city will have charge.

*Telegraph*: The Central has struck a 2-foot ledge, rich in gold. The Central is the old Green Horn mine, and no rock ever came out of it but what paid at least $20 per ton, and fully $200,000 has been taken from the ledge. Charles Duval is now working on the Central, and has to show for his labors one of the best prospects that he has seen after thirty years in the business.

*Herald*: F. Golden has formed another company to take the Chapman Ranch mine; they are prospecting the Chapman Ranch through the Nevada City. A drift has been run from the 450 level of the Nevada City, and is now within 70 feet of the Chapman Ranch ground, which adjoins the Nevada City on the west. Mr. Golden and J. T. McCall still have an option on the Nevada City, and thereby effected an arrangement to develop the Chapman Ranch through his mine.

### Placer.

A nugget, valued at $160, was lately discovered at Iowa Hill by John Watts.

### Plumas.

At La Porte the Dutch Company have replaced their dam, which went out during the recent heavy rainstorm, and the same has been accepted by the Debris Commission. Work at this mine is now in progress.

### Riverside.

R. P. Winters of Perris has been appointed assignee of the Santa Rosa Gold M. Co.

### San Bernardino.

An *Examiner* dispatch says: A five-stamp mill belonging to the Virginia Dale Mining Company at their property on the desert has been "sanded" out of sight and abandoned. The Virginia Dale is about 120 miles east of San Bernardino, and its output has been worked in the five-stamp mill of the company which has been located in a depression, probably in the dry bed of what was formerly a lake. Recently one of the sandstorms for which the desert is famous visited the locality, and when the storm ceased blowing the mill had been completely buried in the sand. To dig it out and clear away sufficient space to permit of its being again operated or to raise it to the new level, was considered to involve an outlay of more than the value of the mill. It was therefore determined to abandon it and a new ten-stamp mill has been ordered.

### San Diego.

AT JULIAN.—At the Owens mine men are at work on the 250, 300 and 350-levels, the objective point being the Owens ledge.

*Sun*: A large number of quit claim and warranty deeds, contracts and mining locations arrived at the county recorder's office this morning from Yuma. They all refer to the recent heavy transactions of ex-Senator Stephen W. Dorsey, of Denver, Colo., and Frank S. Ketchum of the same place, who has given Dorsey complete power of attorney to attend to his business for him. Senator Dorsey has acquired by purchase, trade, locations, etc., nearly 100 mines and claims of more or less value in the Old Picacho district about thirty miles north of Yuma on the Colorado river. Among the more important of these are the Golden Casket, the Golden Horn, the north Belt and the Eastern California. The prices paid run from $1 to $5000 per claim. R. C. Cotton of Los Angeles has also bought a lot of claims of S. D. Northcutt of the same place, also in the same district, for $5000.

### Shasta.

*Free Press:* Three miles west of Kennet, in Back Bone mining district, Saeltzer, Wallace and Graves recently relocated some mining property and bonded it to County Treasurer Jackson for $25,000. Last week ore was struck that will go 20 per cent copper and yield considerable silver. Directly across the ledge an old shaft had been sunk into the sulphuret ore 120 feet. The owners have locations on 4500 feet of the lode and believe they have a bonanza.

Dr. Mitchell has bonded the West End mine at Stella to the Northern California Development Co. of Oakland.

The report published regarding the compromise and sale of the Windy Camp properties is denied.

### Sierra.

*Enterprise:* The Gold Star Mining Co. struck a pocket of gold while sinking on its incline this week.

Thirty-five men are working at the Bald Mountain Extension drift mine; the gold output continues good.

### Siskiyou.

The *Journal* thinks that the mines owned and operated by Billups, Quigley & Humphrey, on Barkhouse creek, Klamath river, will prove to be the biggest bonanza in the mining industry that Siskiyou has experienced for a number of years. There are seven different ledges leading into one large ledge, and the ore prospects from $6.50 to $40 a ton. They have bought a ten-stamp mill. They have been realizing $100 a day from rock crushed in their arrastra.

A five-stamp mill has been bought for the Nebraska mine, on Cherry creek, which is at present worked under a lease by Means & Mahan, who have about eighty tons of rock out now, and by the time the mill is erected, they expect to have 300 tons ready for crushing. This ledge is eighteen inches to three feet in width, and the parties who worked it last year crushed 200 tons of rock, which went from $10 to $20 to the ton.

The Eastlick Bros.' mines at Oro Fino employ sixteen men. They expect to have a prosperous season, as their water supply will last until late, as there is plenty of snow in the high mountains. It takes between 4000 and 5000 inches of water to operate these mines.

The Blue Gravel mine, at Greenhorn, is in constant operation, and the cleanup will no doubt be excellent this season. There has been a plentiful supply of water to operate the mines ever since the January storms. Two shifts are kept employed to accomplish all the work possible as long as the water holds out.

Down at Oak Bar and Hamburg Bar, above and below the mouth of Scott river, active preparations have been inaugurated towards wingdamming and mining the river bed on an extensive scale, as the stream is very low this year, to insure successful working. The snow is nearly all off the Siskiyou range, so that there can be no danger of high water and heavy freshets to interfere with putting in dams and current wheels. The creeks, however, are getting very dry, making the creek and bar mining season shorter than usual.

*Union:* Prospecting and mining, on a comparatively small scale, are being continuously carried on in the close neighborhood of Yreka and also all through the mining districts of Siskiyou. Here in Yreka, almost every morning, one can see one or more starting out at an early hour equipped for a dig or a hunt; and if one strikes something seemingly good, he is not apt to advertise it in the papers until he has thoroughly investigated it, and not then, unless he wants to sell.

### Trinity.

MINING NOTES.—*Journal:* Pierce Asbill has been prospecting and locating mines in the Minersville district. Fortuna citizens interested with him propose to organize a stock company and issue non-assessable stock.

The Enterprise Company is taking out ore, preparatory to crushing, from the Lone Jack and Enterprise locations. The Yellowstone has been opened up in good shape and looks well. A force of men has been put to work on the Golden Chest.

### Tuolumne.

Two years ago Messrs. Scott, Dowe and Campbell, gave San Francisco parties an option on the Black Oak group of five mines for $100,000, which subsequently was forfeited and the owners continued development work themselves. The same property is now reported sold to Eastern men for $300,000.

TUOLUMNE COUNTY MINING NEWS.—*Independent:* On Saturday last another pocket was taken out of the quartz mine belonging to Messrs. Birney, Wainright and Monroe, at Railroad Gulch, near Bald Mountain. The pocket is estimated to be about $3,000, and there is plenty of gold in sight. Gold has been taken out steadily since the large pocket was found several weeks ago. Mr. Monroe showed us a piece of rock for which he said he had been offered $500. The quartz is rather dark in color and is thickly sprinkled with yellow metal.

An unusually rich body of ore was struck last week in the famous Rappahannock mine, owned by Richard Chute. The bonanza was encountered in the 100 and 350-foot levels, and is a surprise, even for that famous mineral belt—the mother lode.

The Rawhide mine is opening out as large as ever on the 900 level. The App mine is showing every indication of being another Rawhide at the depth now attained.

### Yuba.

AN INJUNCTION SUIT.—*Democrat*: In the injunction suit entitled The County of Yuba vs. J. F. Cowdery, et al, Attorneys Forbes and Dinsmore yesterday filed the answer of J. F. Cowdery, J. T. Donohue and T. Hayes, also a notice of motion that on Monday, March 23d, at the hour of 10 o'clock, they will move the court to dissolve the preliminary injuction and to dismiss the action.

The defendant, Cowdery, while admitting that he has an interest in the mines at Grass Flat, Howland Flat and Sacketts' Gulch, Sierra county, claims that they have been working by the ground-sluicing process, drifting process or quartz-crushing process, and denies that they have been working by the hydraulic process since July, 1894. He states that he was never served with a process and was obliged to pay $5.50 to the plaintiff, Yuba county for a copy of its own complaint, so that he could move to dissolve the unserved injunction before irreparable injury was done.

He also denies that they have been working a mine at St. Louis by the hyraulic process, and discharge tailings into Slate Creek. He claims that the injunction was issued to prevent them discharging debris into the Yuba river without any distinction being made between hydraulic and other mining.

The defendant prays that the injunction in the matter may be ex-parte dissolved so far as it relates to other mining than hydraulic and that as to hydraulic mining the action may be at the trial thereof dismissed.

The attorneys moved to dismiss the action and dissolve the injunction on the grounds that the injunction was issued without any legal action being pending. That the action out of which said injunction was issued was commenced and is being prosecuted without any authority of law, and without the authorization and consent of plaintiff.

This is the first time that the latter point has been made.

The contention of the attorneys for the defendants is that Attorneys Phipps and Devlin have commenced the action in the name of Yuba county, without the consent or authority of the Board of Supervisors, and without the proper law officer of this county, the District Attorney, having anything to do with it, and that if the defendants were damaged thousands of dollars by the injunction they would have no recourse against Yuba county because it could hide behind the defense of not having authorized any suit to be commenced.

## NEVADA.

### ESMERALDA COUNTY.

At the Humphrey-Stimler mine at Silver Peak the ore assays high in gold. The lode is wide and well defined.

Teams are engaged in hauling ore from the Big Indian mine. The lessees have out between seventy and eighty tons, which they expect will mill about $80 per ton.

### LINCOLN COUNTY.

Emerson and McGowan, returned from a prospecting trip, are in Pioche with samples of copper ore, found in the southern part of the county. They propose to return with supplies to open up the property and ship ore by the Colorado river.

From the State Line and Eagle Valley district reports are that the coming summer will develop some of the richest mining claims ever discovered in southeastern Nevada and over the line in Utah.

At De Lamar the large force of men employed and the continual arrival of teams from Milford with machinery, reminds old timers of Comstock days.

The Flagstaff Mining Company has levied another assessment, made necessary by the work now in progress on its property at Ferguson district.

During the month of February 115 mining

location notices were placed on record in the County Recorder's office.

To reach De Lamar, it is necessary from Salt Lake City to go by rail to Milford, a distance of 258 miles by rail. At Milford the journey is continued by stage a distance of 100 miles to De Lamar. The stage trip occupies 48 hours and is rough traveling over a barren desert of alkali with water 40 miles apart. De Lamar has a population of 2,000. The bullion wagon goes weekly to Milford, accompanied by four guards. The water for the camp is delivered by wagon. The water rates are one cent per gallon at the spring or one and a half cents delivered. There are a great number of freight wagons running from Milford, and one and a half cents per pound is the rate for freight and it takes from 14 to 17 days to make the trip. Teamsters are charged 50 cents per barrel for water while on the road. Board is $27.50 per month; a room costs $12 per month.

*Pioche Record:* The gold tailings left at the Condor mill from the workings of the Jim Crow ore there last year have been sold by the Nesbitt Bros. to the Phœnix Reduction Company at Bullionville. They are estimated at a thousand tons and will be worked at the Bullionville mill by the cyanide process.

NYE COUNTY.

Tybo is jubilant over the discovery of rich silver and lead ore recently made by two Eureka miners in the Dimmick mine, Tybo district.

STOREY COUNTY.

*Enterprise:* The Hale & Norcross is the wettest mine on the lode, and many of its workings are in clay and soft ground, which is only held in place by careful timbering and constant attention. Once these workings are neglected for any considerable length of time they will cave and fill up beyond redemption. There is considerable low-grade ore in sight in the mine and 20,000 tons of good ore in the bins, and at present there are said to be one or two points in the mine where prospects are good. It seems a great pity in the face of these facts for the mine to be closed down indefinitely.

WHITE PINE COUNTY.

H. L. Frank is about to build a concentrator on the San Jose mine, Egan canyon.

A Eureka company has purchased the copper mines at Bald Mountain and intend to erect a smelting works at once.

## OREGON.

BAKER COUNTY.

A sale involving 571 acres of placer ground on Clarke's creek, formerly known as the Virtue & Van Schuyver gravel mines, was last week made to the Exploring Syndicate of Mines and Mining, composed of Paris and Havre (France) capitalists.

## WASHINGTON.

A Palouse report says that at Jerome, mining prospectors are arriving every day. Palousers are awaiting the vanishing of the snow to strike for the hills and secure claims. Day and night shifts are at work on the Daisy, the shaft is at a depth of 90 feet. As soon as the roads permit, a hoisting engine and stamp mill will be put on the property. A free-milling, three-foot vein has been uncovered on the Lola.

At Kettle Falls, nearly every man in town has located a claim across the river, and every rod of placer ground within ten miles of town. Many are waiting for the snow to leave the higher hills, where quartz ledges are supposed to exist.

IN THE OKANOGAN COUNTRY.—The owners of the Spokane mine, the south extension of the Triune, report a rich strike of ore, assaying high in gold. The Triune has men at work and will run the mill.

## BRITISH COLUMBIA.

The North Star Mining Company, whose mine is located thirty miles from Fort Steele, in East Kootenay, has about concluded to erect its own smelter this season, and to construct a tramway connecting the mine with steamboat navigation on the Kootenay river. The daily output of ore averages fifty tons.

The Le Roi Mining & Smelting Company has a contract with the Tacoma smelter for the delivery of 500 tons of ore.

The Minister of Mines reports that during '95 there were employed in gold mining in the province 1050 white and 979 Chinese and Japanese, besides those in Trail Creek, for which no gold returns were sent in. The output of the other districts was as follows: Cariboo, $282,400; Cassiar, $22,575; East Kootenay, $17,575; West Kootenay, $10,520; Lillooet, $40,663; Yale, $237,311; a total of $636,544 exclusive of Trail Creek. Of this all came from placers except $135,000 from the quartz mines at Fairview and Camp McKinney.

All of the ore shipments from West Kootenay are credited to Collector Johnson's office at Nelson, except that which goes out by way of Revelstoke, which is credited to the New Westminster office. The value of ore passing through Nelson during the month of February was about $300,000, and that going out by the way of Revelstoke $150,000. This makes $450,000. Mr. Johnson estimates the exports for the year at $5,000,000, basing not on what they expect, but what is actually being done, as shown by the records in his office.

The Cariboo Hydraulic Co. will increase its capitalization from $300,000 to $500,000. A new ditch, to cost $60,000, will be built.

Bowles & Raymond of Baker City, Or., have bought the Lily May at Rossland for $40,000, half ninety days, remainder six months, and will put C. H. Egbert in charge.

At Rossland the War Eagle reports that the ore body in the lower tunnel has widened out to 11 feet, and that the ore carries $80 gold and 15 per cent copper.

## ALASKA.

About the best candid statement from an old practical miner seen lately regarding matters of interest to miners in Alaska, or thinking of going there, is the following from L. N. McQuesten, who has been on the Yukon since '73, and who writes from Circle City as follows:

There has been a great change in this country since I came I was the only white man on the Upper Yukon for about ten years, and now there are about 1000 men here and three large steamboats. The business has increased from a few thousand to half a million a year. This is a great mining country. Gold is found in small quantities for 2000 miles on the river, and in several places it is very rich. The country is not one-half prospected as yet. It is very difficult to prospect, as the ground is frozen all summer, and one has to thaw out the ground with fires, which makes very slow work. This is the largest camp on the river: it was struck one year ago last June. There are 600 men wintering here, and the outlook is favorable of it being double that next year. There are about 800 men at Forty Mile. That is about 240 miles from this place. I am doing business at both places. There is another company here; they came in three years ago, but I do about three-fourths of the business. My trade is about $250,000 a year, but the profit is small, as one is compelled to give considerable credit, as it is a hard country to get out of. Any one coming to this place ought to have $300 to winter on, as he is liable not to make anything the first year.

Wages are $10 per day in the mines when you can get work. The mining season is about three months. Flour is 8 cents, bacon 35 cents, beans 12 cents, apples 25 cents, peaches 35 cents, tea $1, coffee 50 cents, butter 50 cents, ham 40 cents and all things in about the same proportion. The mines are about seventy-five miles from here, and it costs 15 cents per pound for freight to the diggings. It costs about $1 a day for living. Fresh meat is 25 cents per pound, and we have had very little this winter. Moose and carribou are the most plentiful, but there are so many men coming into the country that they are getting very scarce.

We have a theater once a week, and tickets are $1.50. There are about fifteen saloons, and there is a dance about every night. There will be a school started next week. There are fifteen white ladies here. They gave a ball to raise school funds. They made about $350 selling cakes. One cake brought $125. They had a very good time, but the funds were not enough to start the school, so the native women gave a ball and sold mittens and caps, and they received $750. Mittens sold for $20 a pair. It was a surprise to the women, as the regular price is only $2.

This place is near the Arctic circle. At this time we see the sun for one hour in the middle of the day. We have had a very pleasant fall up to two weeks ago, then it turned cold.

## UTAH.

The Bingham Electric Light and Power Co., capital $250,000, O. B. Hardy, F. K. Gillespie, R. F. Hayward, J. W. Burton, J. Moffat of Salt Lake, incorporators, proposes to furnish light and power in the West Mountain mining district. Manager Gillespie tells the *Tribune* that it means much for the low grade gold ores of that camp. For years the effort has been made to find a method for the successful treatment of that class of ore, but the cost of transportation and milling has prevented. He also says that where mines now using steam were disinclined to put in electric motors the company will do it, and operate them on a reasonable rental. Contracts have already been made with a number of the large companies, and negotiations are in progress with others. The power for the operation of the Bingham plant is to be derived through the Gillespie water right at Big Cottonwood.

The Elko & White Pine Transportation Co. has purchased the stage line running from Milford to De Lamar and Pioche, Nev., and will run out of Milford daily except Sunday.

C. M. McEntire, Sunshine, is reported to have sold the Black Horse group in Rush valley to C. L. Dignowitz of San Antonio, Texas, for $8000.

The Line district is fifteen miles north of Desert Springs and seventy miles north of Milford. On the Utah Spur lode the vein carries small stringers of ore from three to four inches wide that go as high as 2000 ounces in silver to the ton, besides carrying from $5 to $25 in gold. The ore is black sulphuret and can be easily treated. The Ophir mine shows from three to four feet of ore on the surface on the hanging wall that averages 100 to 300 ounces in silver and also gives good returns in gold.

The Bingham Mining Co. has bought all the property of the Nast Mining and Milling Co. at Bingham, Utah.

W. A. Clark has an option on the Mercur property on which he paid $100,000 this week.

## IDAHO.

Work on the Lewiston Water and Power Company's ditch began last Monday. The lumber for the flume, 1,500,000 feet, will be shipped from the sound. Porter, a local millman, received the contract, but was compelled to come to the coast to fill such a large order on short notice.

In the Blackfoot District, Latah Co., the Blackfoot Consolidated Gold Mining Company are working six claims, the ore is free milling. Different ledges run from 12 inches to 12 feet.

Capt. De Lamar expects to put a gold mill on the Bismarck group of mines.

At Custer, at an altitude of nearly 7000 feet the Lucky Boy and Black mines and mills furnish employment to 150 men, directly and indirectly. The Lucky Boy mine is run steadily. The mill is closed down for repairs. The Black mine and mill have been in operation without intermission since last fall. The bullion is high in gold—the highest, it is said, that has ever before been produced from any mine on Custer mountain. It is a ten-stamp wet crusher, pan process, chemical amalgamation; and it is claimed that the percentage saved is but little less than the battery tests, although the ore carries a manganese base.

At Gem the Standard is daily putting on a few more men; no night shift is working yet. Ten cars of crude ore are daily shipped to the mill at Wallace. A night shift is being worked on the Campbell tunnel, which is now in about 1350 feet, leaving some 2000 yet to drive. Work on it has been pushed steadily since last August, the rate of progress being about 225 feet a month.

FIRE AT BURKE.—Last Wednesday morning at Burke, Idaho, the mills and tramways of the Poorman and Tiger mines were burned. The fire started in the compressor of the Poorman mine, gained great headway, burned the tramway and communicated to the mill of the Tiger mine. The loss is about $200,000, insurance $115,000. All the machinery in both the concentrators and the Poorman compressor and hoist are ruined, with the exception of two boilers, which may be good. The company will immediately rebuild.

The burned mills had a capacity of 500 tons per day, and the new mill will be the same. It will probably be toward the beginning of '97 before the new plant will be in running order. The Tiger mill was built in 1887, and the Poorman in 1888. They are two of the first silver-lead claims located in the Cœur d'Alenes, running most of the time since. The two companies were consolidated October 14, 1895, and the properties were considered among the best mines in this district. They were well equipped with machinery, and since consolidation much new machinery has been added. There has been running only a small force for several months past, while alterations were being made. About 150 men were working at the time of the fire. The principal owners are Glidden, Culbertson, Kingsbury and Clarke of Spokane, Wash.

Boise *Statesman:* Major Liddel has gone to De Lamar to install the electric machinery to be used by the De Lamar Company for the treatment of its ores.

This week a strike was made in the main tunnel of the Trade Dollar mine at Silver City, under the superintendency of James Hutchinson. This tunnel has been following the vein and has been driven 4300 feet. It had previously opened seven distinct ore chutes, from which the large gold and silver production of the property has been maintained. It has now developed another, which seems to be larger and richer than the others. The entire face of the tunnel is in ore, much of which is high grade. The mine is to be further developed by sinking from the tunnel level at a point 3000 feet from the entrance. For this purpose an electric plant is being provided.

MORNING STAR.—*Avalanche:* Money is now in a Boise bank to settle up the indebtedness of this company, and Supt. Nugent will pay off. The draft arrived in Silver City on the 9th inst., while Mr. Nugent was in Boise. In the meantime the miners, who had given the company until the 10th to settle, quit work, and nothing has been done at the Star but to keep the pumps working.

## MONTANA.

State Inspector Shoemaker in his report for '95 says: "During my incumbency the number of mines inspected and miners employed therein are shown by the following tables:

| Year. | Total Mines Inspected. | Number Men Employed. |
|---|---|---|
| 1893 | 56 | 4,309 |
| 1894 | 71 | 6,061 |
| 1895 | 82 | 6,337 |

"Of this number of mines inspected, there were in 1893 in Silver Bow county 28, in other counties 22; in 1894, Silver Bow county 39, other counties 32; in 1895, Silver Bow county 48, other counties 34.

"The coal mines in operation during these years were as follows:

| Year. | Number Mines. | Number Men Employed. |
|---|---|---|
| 1893 | 5 | 1,003 |
| 1894 | 7 | 1,021 |
| 1895 | 6 | 2,411 |

"The grand total of coal, gold, silver and copper mines was as follows:

| Year. | Number Mines. | Number Men Employed. |
|---|---|---|
| 1893 | 53 | 5,312 |
| 1894 | 78 | 7,082 |
| 1895 | 88 | 8,758 |

"I will add to the total number of men engaged in steady mining, 1242, who are working small mines and representing mines, and the large number of prospectors who are classed as miners. This gives a grand total of 10,000 men. I consider this number sufficiently large, as my estimate is made from actual observation and general information gathered in the mining districts."

The unsecured indebtedness of the Butte & Boston Company is estimated at $100,000. Messrs. Couch and Forbis have been appointed receivers.

F. August Heinze has conveyed to his brother, Arthur P. Heinze, nearly all his mining and smelting interests in Butte, the consideration named aggregating $500,000. One deed conveys the Liquidator concentrator, the property, including the claim, concentrator, machinery, tools, etc., for $200,000. The other deed is for the Rarus mine, the Johnstown and Pennsylvania lode claims, together with all improvements, machinery, etc., for $300,000.

Great Falls *Leader*: At the Boston & Montana smelter men are building a foundation for the new power-house, which is to be equipped with three large dynamos. The company contemplates building a new electrolytic plant of about equal size and capacity of the present one. The present plant has a capacity of 3,000,000 pounds per month.

*Inter-Mountain:* The reduction plant of the American Developing and Mining Company at Gibbonsville is successful. Hitherto all the numerous efforts made to extract the values from the ores of that district had signally failed, and the camp was listed with the large number of others in this section of the mining regions under the head of "Plenty of ore, but so base that the gold cannot be extracted with commercial success." The stamp mill is crushing an average of ninety tons per day, and saving about ten tons of concentrates. This mill is specially designed for the crushing and concentration of auriferous pyrites, and a saving of 40 per cent of the value in the crude ore is made on the plates. Nearly 10 per cent of the total value is lost in the tailings and 50 per cent remains in the concentration.

The concentrates are then subjected to treatment by chlorination.

This process involves dead roasting as a requisite preliminary to the chlorination proper. In this process an average extraction of 96 per cent is made of the gold contained in the concentrates. The mechanical loss in the operation will not exceed 1 per cent. By this combination of processes a recovery of 87½ per cent of the total values in the crude ore is effected.

The bar gold saved on the plates ranges about 850 in fineness, while that saved by the chlorination reaches 992½, the latter being the purest bar gold ever tested in the United States mint assay office at Helena.

The unqualified success of this, the only chlorination works running on a commercial scale in Montana or Idaho, should mark a new epoch in the economic reduction of low-grade auriferous pyrites.

## SOUTH DAKOTA.

The Deadwood *Times* wants a branch mint or assay office in the Black Hills. It says the gold product of the Black Hills mineral district, which includes the counties of Lawrence, Pennington and Custer, exceeds $7,000,000 per annum, and individualizes as follows: Homestake and associate mines, lead, $3,000,000; D. & D. Smelting Company of Deadwood, $1,000,000; Golden Reward Company of Deadwood, $900,000; Black Hills Gold and Silver Extraction M. &. M. Company of Deadwood, $400,000; Kildonan chlorination mill of Deadwood, $750,000; Deadbroke Company of Deadwood, $50,000; Columbus M. & M. Company of Deadwood, $75,000; Holy Terror Mining Company of Keystone district, $300,000; Custom Milling Company of Keystone district, $250,000; J. R. Milling Company of Keystone district, $100,000; Old Charley Mining and Milling Company of Custer, $25,000; product of placer mines, estimated at $50,000.

## COLORADO.

Canon City, Colo., reports that as a result of the recent discovery of rich float in the vicinity of Fremont's peak, a few weeks ago, the territory is filled with prospectors and gold hunters. Samples of ore yielded free gold, and people are swarming into the hills.

A. B. Cowles has sold his millsite at Empire Station to N. Gregg of Denver, who will this summer erect sampling and concentrating works to handle gold and silver ores.

El Paso county has a big scheme, the Pike's Peak tunnel to be 55 miles long and to cost $25,000,000.

The Fort Collins, North Park and Western Company has incorporated; capital stock, $1,000,000; to build a road from Longmont, Col., to Steamboat Springs, via Fort Collins and through Hahn's Peak mining district, to connect with the Burlington and Union Pacific.

A new mining camp, Gold Creek, has been located thirty miles west of Cripple Creek by the Gold Creek Consolidated Town and Mining Company. The formation is andesitic breccia and tough granite, porphyry and phonolite dykes, which formation carries the gold deposits of the Cripple Creek district. There are over 150 prospectors in the district.

AROUND VICTOR.—The Ocean Wave and Mimi S. claims located on the southwest slope of Squaw mountain have been bought by the Little Ross Gold Mining Company. The price of the Ocean Wave was $45,000; a cash payment of $22,500 was made to close the deal. The remainder of the payment will be made in stock which will be turned in at twenty-five cents per share. For the Mimi S. the owners are to receive $25,000 on the same terms as the other property. Most of the stockholders in the Little Ross Company are Chicago men. The Ocean Wave and Mimi S. have been worked a little during the past ten months and a small amount of pay ore has been found in them.

*Gazette:* Colorado City will soon have a plant for the reduction of gold ores. Prof. Bartlett is here looking over the situation for Eastern capitalists, and if he reports favorably, a $50,000-plant will be erected at once. The proposed plant will have a capacity of 200 or 300 tons per day, and will be so constructed as to allow of an increase to 500 tons per day with a comparatively slight expense. The process used is of Prof. Bartlett's own invention, and saves silver and copper, as well as gold. It is especially useful for low-grade ores and is said to be very economical and to show a good profit on $10 ores.

Cripple Creek *Times:* J. F. Brady of Chicago has purchased the Crank and Crank No. 2 on Raven hill for a price said to be $150,000, of which $50,000 has already been paid.

## NEW MEXICO.

The plans have been made for a new chlorination mill at Gillett. Fisher & Kadish, backed by New York capitalists, will carry out the undertaking. The new mill will use the California roasters. The capacity will be 100 to 200 tons per day.

The Gold and Silver Extraction Company of America (limited), Denver, Howarth & Co., London, England, and E. C. Smith, E. M., Trinidad, Colo., talk of erecting mills in the La Belle district.

LA BELLE DISTRICT.—Last month C. P. Casey, of La Belle, sent several samples of La Belle ores to the Gold and Silver Extrac-

tion Company of America, at Denver, who on the 13th ult. returned the following report:

MIDNIGHT MINE.

| | |
|---|---|
| Assay, gold, 0.86 oz | $17 20 |
| Assay, silver, 1.30 ozs. at 60 cts | 78 |
| Total | $17 98 |

Extraction by cyanide followed by amalgamation:

| | |
|---|---|
| Gold, 85 per cent | $14 62 |
| Silver, 36 per cent | 28 |
| Total | $14 90 |

Cost of chemicals used per ton in cyanide treatment, $1 25.

EDISON NO. 1.

| | |
|---|---|
| Assay, gold, $1 00 oz | $20 00 |
| Assay, silver, 1.40 ozs. at 60 cts | 84 |
| Total | $20 84 |

Extraction by cyanide followed by amalgamation:

| | |
|---|---|
| Gold, 85 per cent | $17 00 |
| Silver, 38 per cent | 32 |
| Total | $17 32 |

Cost of chemicals used per ton of ore in cyanide treatment, $1 85.

EDISON NO. 2.

| | |
|---|---|
| Assay, gold, 6.82 ozs | $136 40 |
| Assay, silver, 3.96 ozs. at 60 cts | 2 38 |
| Total | $138 78 |

Extraction by cyanide followed by amalgamation:

| | |
|---|---|
| Gold, 95 per cent | $129 58 |
| Silver, 35 per cent | 83 |
| Total | $130 41 |

Cost of chemicals used per ton of ore in cayanide treatment, $2 05.

**ARIZONA.**

Prescott is excited this week over the discovery by Frank Wright of some rich gold ore in Old district, near the Senator mine, twelve miles south of that city.

At the Henrietta mine, near Prescott, 20 men are working in the mine. The manager, Mr. Mayer, reports plenty good ore in sight.

The Queen Gold Mining Company has incorporated at Prescott, to operate the Golden Rule and Missing Link mining claims, west of Prescott, in the Golden Standard mining district.

MOJAVE COUNTY.

(Special Correspondence.)—A rich strike was made a few days since by Mexican prospectors thirty miles south of Yucca station on the line of the A. and P. railroad. Capitalists at the Needles have been interested in the new find and development will be pushed as rapidly as possible. The quartz brought in by the prospectors shows considerable coarse gold.

Shipments of sulphide ore containing both gold and silver are made regularly from Kingman, showing that the mines of Stockton Hill, Cerbat and Mineral Park are not worked out.

## Personal.

CAPT. GILLETTE, U. S. Board Engineers, has returned from a tour of inspection of the upper Sacramento.

M. B. KERR, who is successfully superintending operations at the South Paloma quartz mine, is here purchasing supplies.

HENRY R. WOLCOTT, Jos. K. Choate and C. G. Codman, prominent mining men of Colorado, are here to examine into some proffered properties.

L. G. HAYBROOK of Omaha has charge of the construction of the new bullion refinery which the Puget Sound Reduction Co. is building at Everett, Wash.

IT is understood that Thos. Couch of the Merced, Cal., Gold Mining Co., in Mariposa Co., will be appointed receiver of the Butte & Boston Co., Butte, Montana.

MR. POUNDSTONE succeeds Mr. Allen as superintendent of the Big Canyon mine, El Dorado Co. Mr. Allen takes a similar position in the Utica, Calaveras Co.

W. C. RALSTON, chairman of the Mineral Lands Committee of the California Miners' Association, has returned from an extended sojourn in Boston and New York.

CAPT. J. B. DE LAMAR has gone to Europe. He took with him 200 pounds of arsenical ore from the Golden Gate, Mercur, Utah, that will be subjected to a test at Swansea and Freyburg.

J. B. HOBSON, formerly of Placer Co., has engaged about fifty experienced California placer miners and will take them to the forks of the Quesnelle, Cariboo, B. C., where he has charge of extensive hydraulic mining interests.

JOHN R. REAVIS has been appointed the Trail Creek agent of the Lillooer, Frazer River and Cariboo Gold Fields Company pany of London, England. F. S. Barnard, one of the members of the dominion parliament from British Columbia, is the resident director of the company in the province.

## Recent Publications.

"*The Manual of Statistics and Stock Exchange Handbook*," for 1896, Chas. H. Nicoll, publisher, 189 Broadway, N.Y., price $3, is the eighteenth annual issue of a publication of reference value and authority upon financial topics, railroads, miscellaneous corporations, and the mining, grain, cotton and petroleum markets. The contents include detailed statements of the mileage, capitalization, earnings and offices of all the important railroad companies of the United States, and of the leading coal, industrial and miscellaneous corporations. It also gives the range of quotations for several years past for all securities dealt in on the New York, Boston, Philadelphia, Baltimore, Chicago, Pittsburg, New Orleans and San Francisco stock exchanges. A new feature is the prices of mining stocks in all the markets of the country, with statistical data on the mining industry.

## Coast Industrial Notes.

—The Stanford ranch at Vina, Cal., cleared $80,000 last year.

—Ashland, Or., is shipping woolen blankets to San Francisco.

—Nevada potato growers get $10 per ton for their produce here.

—Beef steers sell at Battle Mountain, Nevada, for $30 per head.

—The S. P. Co. will build extensive railroad shops near Mission bay, this city.

—The steel mill at the Pacific Rolling Mills will resume operations next Monday.

—Tacoma, Wash., shipping men have organized a company to run boats to Alaska.

—There are nearly 1900 men working in the Southern Pacific Co.'s shops in Sacramento, Cal.

—The Manufacturers' and Producers' Association will hold its annual election on the 25th inst.

—Portland, Or., capitalists talk of building a modern steel sailing vessel for the Pacific coast lumber trade.

—Official denial is made of the report that the Panama and Nicaragua canal companies intended to consolidate.

—Convict labor at the San Quentin, Cal., penitentiary makes profitable the manufacture there of sugar bags.

—The Great Northern Railway Co. has cut the wages of nearly all its employes. President Hill draws no salary.

—The Occidental Smelting Co. has organized at Linnton, Or., ten miles from Portland, to build a new smelter there.

—Wool sells for six cents per pound on the railroad platform at Reno, Nev. Freight to San Francisco is one cent per pound.

—Track on the Valley Railroad is laid to the bridge over the Tuolumne river and the bridge builders are putting up a bridge over that stream.

—San Diego has voted to accept a water system to be constructed by the Southern California Mountain Water Co. at a cost of $1,500,000.

—The San Joaquin Valley Oil and Fuel Co. has incorporated with a nominal capital of $2,000,000 to develop oil properties at Coalina, Fresno Co.

—Santa Clara supervisors have granted L. M. Hale a franchise for an electric road from San Jose to Saratoga and Congress Springs. The estimated cost is $250,000.

—With the exception of Congressman Johnson, the entire California delegation oppose the refunding bill and favor the foreclosure of the Government C. P. mortgage.

—After a steady five months' run, during which time 5000 tons of pomace were used in the manufacture of cream of tartar, the Healdsburg, Sonoma Co., factory has shut down for enlargement.

—Since '80, California's orange growing industry has developed greatly. There are nearly 12,000 acres of bearing trees; 75,000 acres planted. Over $3,000,000 is invested. This year's crop will amount to nearly $4,000,000.

—The West Los Angeles Water Co. wants permission to create a bonded indebtedness of $350,000, the interest rate being 6 per cent, payable semi-annually. It is organized to develop water on the Provedencia and Scott ranches.

—F. H. Seymour has been granted by the State of Sonora, Mexico, a concession to build a narrow gauge railway between Torres and Minas Prietas. The maximum rate of freight is to be 40 cents per carga, and maximum fare $1. The concession, which extends fifty years, permits extension of the line to Soyopa, if desired.

—The *Call* says several carloads of horses that started from Oregon for Kentucky last week were stopped at Shoshone, Idaho, by the owners, and the horses were taken from the cars and sold at 50 cents apiece. This was more profitable than to pay the heavy freight bill with what the horses would have brought in Kentucky.

—The Seattle and Lake Washington Waterway Company, which has charge of the construction of a ship canal connecting Lake Washington and Elliott bay, in the State of Washington, has executed a mortgage in favor of the Mississippi Valley Trust Company of St. Louis for $3,250,000. The instrument is given to secure two issues of bonds for the sum named, and the money will be used in excavating the canal and waterways. The work has been in progress about six months, and will be pushed to completion.

—House bill No. 4566, introduced by Congressman Loud of this State, in its present form is a menace to an important industry of the coast and should be opposed by every printer and publisher in the country. It is a direct blow at the existence of weekly newspapers, is framed in the interests of the express companies, and, while not wholly objectionable, needs considerable pruning and amendments. It proposes to so restrict the mail facilities of the country as to threaten the very existence of the weekly paper, general and local. Its effect, if passed, would be to make it almost impossible to successfully conduct the average weekly publication.

—Col. M. R. Jefferds, an American railway engineer now in this city, has an agreement by which he is to have the contract for building the Peking & Hankow Railroad, provided he secures subscriptions in this country or in Europe to the amount of 10,000,000 taels, about $13,500,000 in Mexican money. There are in China at present but two short railroads, one of 150 miles and the other of 62 miles. In January Hsu Yin Tsiang, a Tavtai, or mayor, of Kuangtung, was given by Prince Kung, superintendent of military affairs, permission under authority of the Emperor to construct a railroad from Peking north to Hankow, a distance of 750 miles. The right is also granted to build from Peking south to Canton, a distance of 600 miles, upon completion of the Hankow road. One of the conditions is that not less than two-thirds of the capital necessary, which will amount to about 30,000,000 taels, must be subscribed by Chinese. Col. Jefferds, who was in China at the time, secured an agreement from Hsu, which, if he carries out his terms, will give him the contract for building the road. He agreed to come to California to induce the Chinese merchants in San Francisco to subscribe and to use their influence to dispel the prejudices of their countrymen against railroads and show them their value.

## Books Received.

"*Matte Smelting: Its Principles and Later Developments, with an account of the Pyritic Process.*" The above, by Herbert Lang of Shasta, Cal., is a valuable addition to metallurgical literature. Mr. Lang's two-page article in the MINING AND SCIENTIFIC PRESS of January 12th, 1895, showed his possession of practical knowledge on this important subject, and the 90-page treatise just issued by the Scientific Publishing Co., from his pen, is additional evidence of the successful study he has given scientific modes of smelting. The essay is timely and important. The magnitude of the smelting industry is great, and growing. It is probable that $25,000,000 is not an exaggerated estimate of the aggregate value of metals extracted by matte smelting processes in this country in 1895. Mr. Lang has wisely compressed discussion of his subject into such space as to make it of added value to the busy reader. There is not a page of padding; it may even be said that the book is too brief, but if more be found necessary, as will probably be the case, it can be supplied in a subsequent edition. The volume is divided into four sections; the first discusses matte smelting per se, the second treats of slags, the third of pyritic smelting, the fourth losses in smelting, sale of products, tables, etc. Mr. Lang does not write solely from observation, but from the more satisfactory standpoint of practical experience, and his book deserves to be read by every man who is in any way interested in the subject. Seldom has a book appeared that gives so much valuable information in so readable and condensed a form. As advertised elsewhere, it will be sent postpaid to any address on receipt of price, $2.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING MARCH 10, 1896.

556,248.—SALUTING DEVICE—J. C. Boyle, Spokane, Wash.

556,089.—CONCENTRATOR—W. G. Dodd, S. F.

556,187.—ORE PULVERIZER—H. P. Holland, Oakland, Cal.

556,188.—ORE FEEDER—H. P. Holland, Oakland, Cal.

556,195.—GAS ENGINE—F. W. Mellars, S. F.

556,157.—WATER STILL—W. G. Minor, Los Angeles, Cal.

556,052.—CAN LABELING MACHINE—Parkinson, Childers, Hanson & Wakefield, Crescent City, Cal.

556,168.—COUPLING BICYCLES—T. S. Taylor, San Rafael, Cal.

556,294.—COASTING WAGON—C. L. Whipple, Los Angeles, Cal.

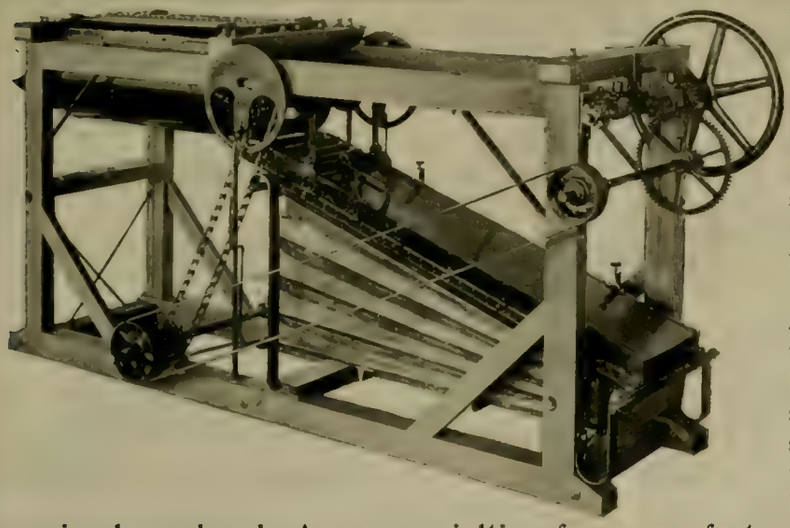
556,076.—BICYCLE CLEANING STAND—C. A. Wright, S. F.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Commercial Paragraphs.

THE P. & B. Manilla Roofing, which has recently been put upon the market, supplies the miner with a long felt want. Its cost is low both for material and cost of laying. It is put up in very compact form for shipment and is specially valuable for use on mine and mill buildings when located at a distance from supply points. It will replace shakes and shingles, as it is cheaper, much more fire-resisting, and, when laid according to directions accompanying each roll, will give better service. Send for sample and price to the manufacturer, Paraffine Paint Co., No. 116 Battery street, San Francisco, or 111 South Broadway, Los Angeles.

## Obituary.



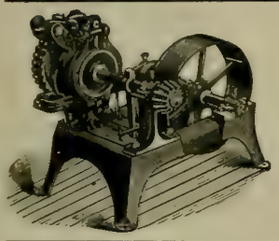
ANOTHER of California's distinguished miners and metallurgists has passed away in the person of Mr. Carl A. Stetefeldt, who died at 967 Alice street, Oakland, Cal., last Tuesday morning, aged 57. Deceased was a native of Germany, and for nearly thirty years was a resident of this coast, actively engaged in mining projects. His contributions to standard mining literature have been many. His last published work is "The Lixiviation of Silver Ores with Hyposulphate Solutions." Mr. Stetefeldt was the inventor of the furnace which bears his name.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.



WE make mining machinery of all kinds. We also "make the Miner," that is, Woods' Dry Placer Miner, as illustrated here. Users say it is "really perfect." In writing about it ask for catalogue 51.

Smelters are using our semi-steel moulds, kettles and pots extensively; they give first rate satisfaction. We are also making welded steel water jacket furnaces, better than anything previously produced. Among specialties of our manufacture are perforated metals; also riveted steel pipe for hydraulic lines. You will find us obliging in making estimates and giving particulars, as we aim to serve the interests of our customers in the best way.

BY USING

# THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c. | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c. | 48 |
| Crude Petroleum (36 deg.), paraffine base, 13 gallons @ 5c. | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ¼c per horse power per hour; on domestic coal oil, 1½c per horse power per hour; and on gasoline, 2½c per horse power per hour.

# Market Reports.

## The Markets.

SAN FRANCISCO, March 19, 1896.

There is a continued free movement in goods for Alaska. The buying is for canners' supplies and gold miners' outfit. Outside of the above, the general trade is about the same as ruled in 1895. It is conceded that the call from the gold mining districts on this coast will show a large increase over last year. This will set in quite actively next month. In the agricultural districts trade depends largely on the weather. If there are well-distributed spring rains, dealers will have confidence and not hesitate to buy freely. A good wheat crop means much better times, for farmers can pay cash for supplies, besides being able to pay up or else pay considerable on their back debts.

The money market is in a mixed condition. While borrowers offering choice to gilt-edge security have no difficulty in getting funds, those not so favorably situated have considerable difficulty in getting money. The latter are compelled to depend largely on outside capitalists, and these never miss an opportunity of exacting a good rate of interest. This necessarily interferes with speculation and new ventures, where more money is required than the promoters command. This condition will change for the better if we have good crop weather.

**New York Silver Prices.**

NEW YORK, March 19.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. | Copper. | Lead. |
|---|---|---|---|---|
| Friday | 31 9-16 | 68¾ | 10 80 | 3 07½ |
| Saturday | 31 9-16 | 68¾ | 10 80 | 3 07½ |
| Monday | 31 5-16 | 68⅝ | 11 | 3 10 |
| Tuesday | 31 7-16 | 68⅝ | 10 80 | 3 07½ |
| Wednesday | 31⅜ | 68⅛ | 11 | 3 12½ |
| Thursday | 31¼ | 68⅛ | 11 | 3 12½ |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, ⅝ per annum | .7@8 |
| Commercial Loans, prime | .6@8 |
| Call Loans, gilt edged | .7@8 |
| Call Loans, mixed securities | .7@8 |
| Mortgages, prime, taxes paid by lender | .6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.87 |
| London Merchants | $4.85 |
| London Sight Bankers | $4.88 |
| Refined Silver, per oz., 1000 fine | 68¼c |
| Mexican Dollars | 55@56c |

SILVER.—As will be seen above the market fluctuated more than for months. While the closing was lower in London, yet there is a belief that it will strengthen next month. This opinion is based on the fact that the China tea trade opens then and this is invariably followed by a better demand for bullion from the orient.

The steamer that sailed the past week from this port took out $220,700 in silver bullion. On Tuesday a resolution passed the House of Commons declaring that the House was of the opinion that the unstability of the relative value of gold and silver since the action of the Latin Union in 1893 has proved injurious to the best interests of the country, and urging the Government to do everything possible to secure by international agreement a stable monetary par of exchange between gold and silver. During the debate it was brought out that the English Government was not adverse to opening the Indian mints to silver, provided an international monetary agreement was arrived at. This sets at rest the opposition against the latter metal in the German Reichstag. It looks at this writing as if an international monetary convention will be held either in 1896 or 1897.

MEXICAN DOLLARS.—The shipments to China the past week aggregate 140,369. The market is quiet at quotations, but a better demand is expected to set in next month.

COPPER.—The European and Eastern markets shaded off, but toward the close they showed more strength. The stronger feeling is due to an improved consumptive demand.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

LEAD.—Inside quotations for pig are lower. The market at the East weakened off, but yesterday it moved up under an improved speculative and consumptive demand. The output in this country is said to be about the same as it was last year.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—A fair trade demand is reported at steady prices.

The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

QUICKSILVER.—The market is quite but steady for both home and export.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 40 00 |
| West Coast of Mexico, for Export | 35 00 |

BORAX.—The output on this coast is being absorbed by eastern shipments. The market is firm.

The market is quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6½ |
| Refined, in sacks | 5¾ |
| Powdered, in car lots | 6¼ |
| Concentrated, " | 5½ |

TIN.—For pig, the market has ruled steady at all demand markets. With us the heaviest demand for tin plate for canners' use seems to be over for the season. There is considerable going forward to the canners in Alaska. For fruit canners the demand is of an offish character.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—The market is quoted at 9 cents, which is a decline on last week's prices.

COAL.—Arrivals the past week were not large, but liberal stocks here and to arrive are against sellers. The consumption is fully up to the average at this season of the year. The feeling among dealers seems to be unsettled, but the impression with the majority is that prices will not change until the wheat crop prospects are mose definitely settled.

SPOT FROM YARD—PER TON.

| | | | |
|---|---|---|---|
| Wellington | $7 50 | @ | 8 00 |
| Greta | 6 00 | @ | 6 50 |
| Nanaimo | 6 50 | @ | 7 00 |
| Gilman | 5 50 | @ | 6 00 |
| Seattle | 5 00 | @ | 5 50 |
| Coos Bay | — | @ | 4 50 |
| Cannel | — | @ | 8 00 |
| Egg, hard | — | @ | 13 00 |
| Wallsend | — | @ | 6 50 |
| Scotch Splint | — | @ | 7 50 |
| Brymbo | — | @ | 7 50 |

TO ARRIVE—CARGO LOTS.

| | | | |
|---|---|---|---|
| Australian | 5 25 | | |
| Liverpool Steam | 6 25 | | |
| Scotch Splint | — | | |
| Cardiff | 6 25 | | |
| Lehigh Lump | 9 00 | | |
| Cumberland | 13 50 | | |
| Egg, hard | 10 00 | | |
| West Hartley | 6 50 | | |

COKE.—The general situation is unchanged since our last week's issue.

| | | | |
|---|---|---|---|
| Gas Companies' | — | — | — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — | @ | 8 50 |
| " in sacks | — | @ | 9 50 |
| Cumberland | — | @ | — |

LUMBER.—The demand is said to be active. The general market is firm, with some kinds reported to be selling higher.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 16 00 | @ | — |
| Pine | 13 00 | @ | 18 00 |
| Spruce | 25 00 | @ | 30 00 |

NAILS.—There is a continued good demand for the season of the year. The market is strong. Advices from the East state that an advance of 25 cents a keg will go into effect April 1. Our market will sympathize.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Wire, carloads, basis per keg | $3 07½ | | |
| " jobbing, " " | 3 20 | | |
| Cut, carloads, " " | 2 82½ | | |
| " jobbing, " " | 2 95 | | |

## Mining Share Market.

SAN FRANCISCO, March 19, 1896.

The market for shares in the Comstock mines was dull and heavy up to Saturday, when it became active at slightly firmer prices. On Monday the strength was more pronounced, particularly in Yellow Jacket, Belcher and Crown Point in the Gold Hill group and Sierra Nevada in the North end. Prices were fairly maintained Tuesday morning, but in the afternoon they eased off, chiefly under the selling of a well-known plunger in the Pacific Board. Yesterday the market held around at Tuesday's closing. The advance in the Comstock shares is not attributable to any improvement in the mines, but it is stated to be on a reported contest for the control of one or two of the Gold Hill mines. This report may be correct, yet there is an impression that it is put out for the purpose of favorably influencing the market, so as to collect assessments now levied and also those to come on in April. Mine managers work on the principle that once a bull always a bull in sentiment, and that it does not take much to cause outside bulls to carry stocks and pay assessments, even with conditions being against much of an up movement. Outsiders evidently forget that, with over a million shares to handle, it takes a large moneyed interest, backed by ore developments in two or more mines, to send the market up to an average of one or two dollars a share. Gudgeons and suckers, as the English call sentimental traders, are scarce nowadays, and without them no bull movement can be maintained without dividend-paying mines. While saying this, it must not be inferred that a small up-move cannot be promoted at almost any time, provided the parties back of it see an opportunity of selling out. The active work in some of the mines is apt to run into ore at any time, which can be magnified by cappers and others so as to excite the cupidity of a few outsiders, who rush in as buyers for fear of being left.

The new managers of the Hale & Norcross mine have met with an unexpected opposition from the Miners' Union on the Comstock. This organization is said to be opposed to the new superintendent of the mine. This action on the part of the Union makes it bad for a combination outside of the present rings to get control of any of the mines. This spirit of opposition is not calculated to promote a healthy movement in the share market.

The market for shares in Bulwer and Bodie was more active the past week. Prices were advanced under a reported contest for the control of Bulwer, but towards the close it weakened off. Whether the lower prices will be followed by still higher figures is as yet an open question, for the news from the mines is not of a character to sustain much of an upmove.

From the Comstock mines the news is, as yet, of the same character as has come to hand for some time past. In the Alta group the work in Alta seems to be the guiding star, but so far as can be learned it is not calculated to inspire confidence that a large body of good ore will be run into, although it is liable to run into stringers at any time. At this writing it looks as if it will take considerable time before anything of a definite character can be ascertained, and this means assessments and probably no body of ore. In the Gold Hill group, Overman and Belcher continue to report some ore being extracted and raised, but not enough to cover expenses. In the other mines in this group no ore is reported in official letters. The work in this group is not of such a nature as to create a bull feeling, although stringers of more or less size are liable to be run into, which may give temporary life to the shares. The most active work seems to be in Crown Point, but even this appears to be mostly for the purpose of laying the foundation for future work. It may take some time before this is laid. In Confidence, Challenge and Con. Imperial the joint west drift is being extended about six feet a week. At this snail pace the striking of the west ledge points to time, with assessments soon. In Alpha and Bullion the work to the west makes slow progress. To raise funds the latter company had to levy an assessment, while the former company will be compelled to levy one before long. In the Middle group attention is largely centered on Hale & Norcross, where work has been suspended pending a settlement with the miners. When work is resumed in this mine it will probably be on the 900-foot or 700-foot level. Expenses have been cut down very materially by the new management. In this city they have been reduced fully one-half, and it is said a similar reduction will be made at the mine when work is resumed. Some ore is being raised by the other mines in this group, but not enough to excite the cupidity of dealers in the market. In the North End group new work has been started this month in Con. Virginia and Sierra Nevada, but what it will result in is, as yet, largely a problem. The recent strengthening in the share market admitted of Ophir levying an assessment, which will be followed by another company in that group putting on one next month. The market for Comstock shares was more active this afternoon, with Yellow Jacket, Crown Point and Belcher selling at higher prices.

From the Brunswick lode our advices continue to report active work in Occidental. It is expected that the ore for which they are running on the 750-foot level will be struck soon, but how much will be found is entirely guesswork. In the meantime the shares in this mine are well held. The work being done by the other mines on this lode is not of a very active character. It seems to be held back so as to find out what will be found in Occidental.

Late advices from the Bodie district state that a few tons of ore are raised each week in Bulwer while pushing exploiting work. In Bodie they have run into six-foot ore, but it is low grade. The work in this mine is being pushed in several directions. This will help the management to collect the assessment levied last week.

The following illustrates the changes of the week:

| MINES. | Mar. 12. | Mar. 19. |
|---|---|---|
| Alpha | | |
| Alta Consolidated | $ 14 | $ 16 |
| Andes | | 31 |
| Belcher | 20 | |

# Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, Cal.; location of works, Auburn, Placer county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 20th day of February, 1896, an assessment (No. 2) of 1 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 237 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of April, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made be before, will be sold on THURSDAY, the 30th day of April, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office—237 Twelfth street, San Francisco, California. Office hours from 8 to 10 P. M.

CON. CALIFORNIA AND VIRGINIA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of March, 1896, an assessment (No. 6), of 30 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 28th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1896, an assessment (No. 5) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 56, No 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 4th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 56, No. 309 Montgomery street. San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION—having received applications to mine by the hydraulic process from A. J. McDonald, in the Kanaka Valley Mine, at Salmon Falls, El Dorado Co., to impound tailings in a ravine; from Paris Bean, in the Empire Hill Mine, in North-East Township, Yuba Co., to impound tailings in Empire Creek and in an old pit; from John J. Bailey, in the Badger Hill Mine, near Placerville, El Dorado Co., to impound tailings in a ravine; from B. Guidici, in the Grasshopper Hydraulic Mine, near Pleasant Valley, El Dorado Co., to impound tailings in a ravine; from Mrs. Amalie Hafner, in the Dark Ravine Mine, near Crescent Mills, Plumas Co., to impound tailings in Dark Ravine; from E. D. Hurd, in the Miners' Row Mine, near Michigan Bluff, Placer Co., to impound tailings in a ravine; from Alfred A Ludwig and William Everest, in the Nellie Bly Mine, near Igo, Shasta Co., to impound tailings in a ravine; and from R. R. Gumbert, in the Duquesne Placer Mine, at the head of Poplar Creek, Plumas Co., to impound tailings in a ravine—gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on April 6, 1896, at 1:30 P. M.

**ASSAYER WANTS POSITION.**

Young practical man about mine, mill, chlorination or cyanide works. Address "MOTHER LODE," care MINING AND SCIENTIFIC PRESS.

**Position Wanted as Chemist or Assayer**

In a mining or manufacturing establishment. Many years' experience and highest reference. Address CHEMICAL, MINING AND SCIENTIFIC PRESS.

**An Assayer, Surveyor, Bookkeeper and Lawyer**

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**

**220 Market Street.....San Francisco, Cal.**

***Assaying.—Part I—Gold and Silver Ores.***
Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth: 1889. Price, postpaid.....$1 00

***Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.***
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

***Assayer's Guide.***
By Oscar M. Lieber.....$1 50

***Assayer's Manual.***
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

***Manual of Assaying—Gold, Silver, Copper and Lead Ores.***
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

***Notes on Assaying and Assay Schemes.***
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

***Blowpipe Analysis—Manual and Qualitative.***
By F. M. Endlich.....$4 00

***A Practical Guide for Prospectors and Miners***
By C. W. Moore. With numerous illustrations.....$4 75

***The Explorer's and Assayers' Companion.***
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

***Aaron's Leaching Gold and Silver Ores.***
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

***Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.***
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

***The Lixiviation of Silver Ores with Hyposulphite Solutions.***
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00
Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

***Modern Copper Smelting.***
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

***The Metallurgy of Gold.***
By M. Eissler. Profusely illustrated.....$5 00

***Losses in Gold Amalgamation.***
By W. McDermott and P. W. Duffield.....$2 00

***Electricity in Mining.***
By Sylvanus P. Thompson.....60 cts.

***Practical Treatise on Hydraulic Mining.***
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid.....$5 00

***Practical Hydraulics.***
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

***Hydraulic Gold Miner's Manual.***
By T. S. G. Kirkpatrick. With plates and cuts.....$2 25

***Manual of Hydraulic Mining for the Use of the Practical Miner.***
By T. E. Van Wagenan.....$1 00

***The Sampling and Measurement of Ore Bodies in Mine Examinations.***
Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

***Manual of Mining.***
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

***A Text Book of Mineralogy.***
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

***Manual of Determinative Mineralogy.***
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

***Metallurgy of Silver, Gold and Mercury in the United States.***
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 50

***Metallurgy of Silver, Gold and Mercury—Continued.***
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

***Notes on the Treatment of Gold Ores.***
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

***A Practical Manual of Minerals, Mines and Mining.***
By H. S. Osborn.....$4 50

***Matte Smelting—Its Principles and Later Developments with an Account of the Pyritic Processes.***
By Herbert Lang.....$2 00

***Introduction to the Study of Metallurgy.***
By W. C. Roberts-Austen.....$4 00

***Practical Metallurgy and Assaying.***
By A. H. Hiorns.....$1 50

***The Practical Metal Worker's Assistant.***
By Oliver Byrne. Illustrated.....$5 00

***Quartz Operator's Handbook.***
By P. M. Randall.....$2 00

## Great Reduction in Light!

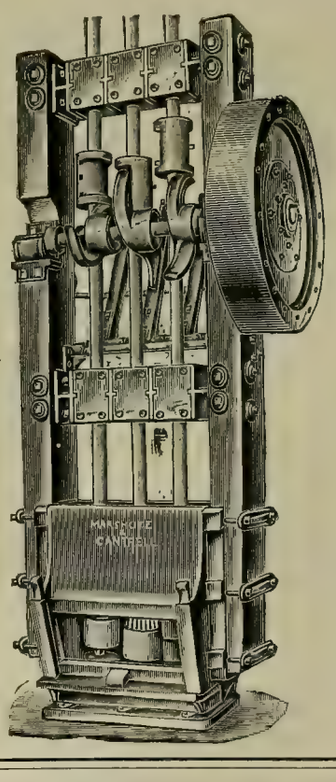
# IMPERIAL
# Automatic Gas Machine

**Produces a Beautiful Light.**

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.



For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

# RISDON IRON WORKS,

SAN FRANCISCO, CAL.

## READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.

One set of tires will crush 1500 tons.

One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary "peon," earning one dollar per day, has complete charge.

In regard to sliming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK. Pres.

SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. McIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. McIVER, President.

### An Important Mining Decision.

The recent judicial decision in the case of the Carson City G. & S. M. Co. vs. North Star M. Co., in which judgment was given for the defendant, is of sufficient interest to the mining world to merit reproduction in full. Herewith is an engraving of the ground in controversy, and the decision of the judge in full:

In the Circuit Court of the United States, for the the Northern District of California.

Carson City Gold and Silver Mining Company, plaintiff, vs. North Star Mining Company, defendant.

W. H. Dickson, A. C. Ellis and C. W. Kitts, attorneys for plaintiff, and Curtis H. Lindley, attorney for defendant.

This is an action of trespass brought by the plaintiff, as owner of the Irish American mining claim,

situated in Nevada county, California, against the defendant, which, as owner of the North Star claim, has followed and worked its ledge upon its descent under the surface of the former claim. Each claim is a consolidation of a number of small claims, many, if not all, of which were located long prior to the enactment of any mining law by Congress, and is patented in the irregular shape and of the unusual size represented upon the following plat—the Irish American being about 1500 feet square, with a strip extending from the main body about 600 feet east, and the North Star, lying 300 to 400 feet south, is about 3100 feet long from east to west and 650 to 1250 feet wide.

The plaintiff's theory is, that the apex of the "North Star" ledge runs so near northwesterly and southeasterly that if continued in its course it would cross the side lines, 1-2 and 3-4 of the claim, but that the ledge in its northwesterly course, before reaching the north side line, is interrupted by a nearly perpendicular north and south fissure or at least a distinct line of change in the geological formation of the country, called in this case a "crossing," to the west of which the ledge does not appear either upon the surface or in the underground workings. The defendant claims that the apex of its ledge runs in an easterly and westerly direction from end to end and along the center of its "North Star" claim, and that its dip is northerly or practically in the direction of its main working shaft, and, while admitting the existence of the "crossing," affirms that the ledge continues to the west of it. The surface of the claim is so covered with soil, and any outcroppings of a ledge that ever may have existed are so obliterated by past mining operations, that very little can now be determined by surface indications of the course of the ledge. Perplexity is added from the fact that over much of the surface there are many old mining shafts and workings in which more or less ore has been found and which are in such relative positions that they are no guide to the location of the course of any ledge. A portion of them are represented on the plat by dots and crosses.

(1). During the trial plaintiff objected to defendant's evidence based upon the North Star claim as patented, and insisted that the claims of which it is composed should be shown as originally located, and that the rights of the parties should be governed by the located lines of those claims and not by the patented lines of the North Star. This objection was overruled, and as upon final argument plaintiff insisted upon its objection, a brief consideration of it will precede any discussion of the other issues.

In this objection are involved the questions of the parallelism and of the intersection by the ledge of the end lines of the original locations. When those locations were made there was no law requiring such parallelism, but independent of all lines the right to follow the ledge along its course for the full distance claimed and underground upon its true dip to any depth was undisputed. Although Section 9 of the act of 1872, in repealing certain parts of the old law, provided that "such repeal shall not affect existing rights," the courts have held that when any claim is patented those rights are controlled by the patented lines. If, however, plaintiff's objection could so far prevail that defendant should be compelled to rely upon the original claim as located, instead of upon the North Star patent, it ought to follow that they should be considered as unpatented claims, and all rights which attached to them prior to patent should accrue to defendant, for manifestly it would be unjust to deprive defendants of all benefits arising from its North Star patent, as well as those which attached to the original location while unpatented. Moreover, the defendant, owning the several claims which now compose the North Star, might have procured separate patents for each claim, and in doing so might have so changed the end lines as to make them parallel, just as is always done now in application for patent, and if the several claims jointly included the entire apex, all the claims could have been so surveyed as to make all the end lines parallel to each other, and thus give it what it now substantially claims by its North Star patent. The defendant has only done by one act, at less expense, what it lawfully might have done by several acts at greater expense. The North Star patent is of greater superficial area than any law has ever authorized for a single ledge location, but it has been held by the Supreme Court that, while the law prescribes a limitation to the size of a single location, there is no limitation to the number of claims one person may hold by purchase or that may be included in a single patent, and, as I understand, that may be included in a single survey showing only the exterior boundaries and omitting all interior lines of the several smaller claims. Such was the holding as to agricultural lands in Polk's Lessees vs. Wendell, 9 Cranch, 87, and as to placer claims in Smelting Company vs. Kemp, 104 U. S., 636. There appears no reason why the same rule should not apply to quartz claims. Independent, however, of the foregoing consideration, a patent has been granted for the North Star claim. It has passed beyond the field of discussion that a patent can not be collaterally attacked on account of any question which the land department could lawfully determine before issuing it. Without now defining what questions are settled by the issuance of a patent, it is held that the question of the defendant's right to a patent to the North Star, with the boundaries as defined by it, was within the jurisdiction of the department and was determined by it, from which it is held to follow that the boundary lines as defined by the patent are the only lines by which the rights of the parties can be determined. To adjudge such rights by the original lines of the several claims of which the North Star is composed would be such an assault upon the patent as cannot be sustained. The former ruling upon plaintiff's objection is, therefore, adhered to.

(2). Without making special reference to the testimony of the several witnesses as to the location and course of the apex, it may be concluded, as clearly established, that a ledge had been found in a number of the group of old shafts existing near the south side line of the North Star. Upon one of the plaintiff's maps is indicated a line of shafts running east and west which is marked "shafts on apex." Plaintiff's witness, Hugunin, was on the ground the day this ledge was discovered in 1851, and located a claim running west from the main shaft, and he fixed a point, designated "B" on the plat, being over 100 feet westerly from the mouth of the main shaft, as within his claim and as the most westerly cropping of the ledge. He also located the apex of the ledge 50 feet south from the mouth of the Larimer shaft and 40 to 50 feet south of the old powder house, which was on a direct line connecting the mouths of the main and Larimer shafts. An apex running through these three points fixed by this witness and continued in its own direction each way would cross the south side and west end lines of the North Star, and the same result would follow to pass a line through these points and the group of shafts. I do not think that from a fair consideration of all the plaintiff's evidence, it can be concluded that the source of the ledge is across both the side lines. On the contrary, defendant's witnesses locate the apex easterly and westerly near the center line of the claim as indicated upon the plat, and the witness Morse located croppings at a point designated "C," being about 300 feet west from the mouth of the main shaft, and he says that he and his associates located ten claims running west from the Auburn road, "as near as we could tell on the line of the ledge." Defendant's witnesses are corroborated by other established facts: (*a*) Before the surface was disturbed and when indications of the ledge were clearer, the original locations were made upon an east and west line and about along the central line of the North Star. (*b*) The workings of a mine made in mining operations and not in support of litigation are generally important as evidence of any facts which may be legitimately inferred from them. The three incline working shafts were started upon this North Star central line and are all shown to follow the ledge in their descent. It is reasonable to presume they were started upon or near the apex of the ledge. (*c*) The working levels in this case are not so conclusive as usual of the course of the ledge, for the reason that there are large "horses" in the mine to the upper and lower surface of which the workings have conformed, which largely accounts for the varying directions the levels have taken. A majority or many of the upper levels are nearly parallel with the north side line, while others, if prolonged, would cut the west end and south side lines, and still others would cross both side lines and especially those in the deeper workings. But as ledges may in their depths change their course, and as the surface course or the course of the apex is to govern the miner's rights, the workings nearest the surface are better guides to the course of the apex than those far below. Plaintiff admits that there is a mineral vein along the line claimed by the defendant as the apex, but says it is but a spur or seam from the ledge which runs elsewhere, its exact locality not being fixed. That this is but a spur or seam of a ledge and so important that it cannot be made the basis of a mineral location, cannot be reasonably concluded when it is remembered that the first locations were made upon and along it. However, the law fixes no limit to the size or prominence of a mineral-bearing vein before a mining location can be made upon it. While in the group of shafts referred to a ledge was found, its apex or the course of the apex has not been located unless it be by the plaintiff's testimony concerning the "shafts on apex" before named, and it has not been shown that any vein crosses or is found beyond the south side line. It is not impossible that the apex of whatever vein exists at this place, if traced out, would assume a course somewhat corresponding to the outline of the group of shafts and running in a northeasterly and a northwesterly direction until it unites with the other line of apex, and that the two outcrops or ledges are but parts of one vein which are separated by a large "horse," which defendant's evidence and diagrams show exists near the surface of the mines. There is some evidence, at least, to show that two veins do unite in the workings not far below the surface.

From a full consideration of all the evidence it is concluded that the first mining locations were located along the central line of the North Star claim; that such line is practically the line of the apex of the ledge in controversy; that it has been fixed at different points along the irregular lines indicated upon the plat between the letters "*C* and *D*" and running in a direction south about 80° east.

(3). Generally when a ledge has been traced for such a distance in a claim of this size it would not be an unreasonable presumption that it would continue in the same direction far enough to cross the end lines of the claim. This presumption may be indulged as to the east end line, but as before stated, plaintiff asserts that it does not, either on the surface or underground, pass west of the "crossing," which contention is sustained by the testimony, while that of the defendant is to the contrary. Underground there may be some indications of a ledge west of the "crossing," but little if any ore has been found there and the workings of the mine, with some unimportant exceptions, sustain plaintiff's contention. Upon the surface there is nothing shown by which to definitely locate the line of this "crossing." Conceding, however, that the ledge intersects the east end line, from whence it extends no farther than about 2200 feet westerly to the point "*C*," fixed by the witness, Morse, as the place where he found the croppings of the ledge, what are defendant's underground rights? That the end lines are not parallel, cannot be the basis of an objection, because their convergence when extended in the direction of the dip of the vein would give defendants less, instead of more, than the law provides for.

Attention has not been called to any precedent in which a ledge is abruptly terminated on its onward course, as is claimed occurs in this case, but a similar principle is involved when a ledge passing through an end line is terminated as to the claim, by going through and out of it, across a side line. Under such circumstances it has been held that the ledge may be followed on its descent between the perpendicular plane drawn through such intersected end line and another similar parallel plane passing through the point where the ledge crosses the side line. Last Chance M. Co. vs. Tyler M. Co., 61 Fed. 560–564; Wyoming vs. Champion, 63 Fed. 541–546; Del Monte M. Co. vs. New York M. Co., 66 Fed. 212; Fitzgerald vs. Clark, Pac. — which I followed in the last hearing of Last Chance vs. Tyler, — Fed. —. When the last case was first before the Circuit Court of Appeals, that Court said: "If the lode in question, instead of extending into the Last Chance location, had abruptly broken off within the surface lines of the Tyler near the point where, in fact, it crossed the line, there could certainly be no question as to the right of the Tyler to follow the lode or vein in its downward course for its entire depth outside of the vertical planes drawn through the side lines. The fact that it continued its course and crossed the side line does not in any manner change this principle. In either case the locator is entitled to the same rights. In such cases the end lines are not necessarily those which are marked on the ground as such. An end line may be drawn at the point where the lode abruptly terminates within the surface lines or at the point where the apex of the lode crosses

the side line of the surface location. 54 Fed. 292. It is therefore concluded that the defendant may follow its ledge on its descent under the Irish-American claim and to any depth between a perpendicular plane drawn through the east end line of its claim and another similar parallel plane crossing such claim at the point fixed as the western terminus of the ledge, being designated by "C" and westerly from the east end line 2200 feet, measured along the straight central line upon the plat and along the like line upon defendant's exhibit 8; provided, that defendant shall in no event pursue its ledge west of a perpendicular plane extended through the west end line of its claim, and judgment for the defendant is ordered accordingly.

There was another question suggested, but as it was based upon the theory that the course of the ledge was such as would carry it across the side lines, which I cannot adopt, it will be unnecessary to consider it. BEATTY, Judge.

March 9, 1896.

Either party shall have thirty days after notice of this decision to take any steps in the case desired. And proposed judgment or papers to be signed by me must first be presented to the opposite side and, with their objections noted, may then be presented to me for action. BEATTY, Judge.

Filed March 16, 1896.

## Concentrates.

BANNING, CAL., is becoming the center of supplies for the desert mines.

THE fifty seats in the Gold Mining Exchange of this city have all been sold.

LAST WEEK Placer Co. raised nearly $300 additional for the State Miners' Association.

CRIPPLE CREEK, COLO., is now supporting eight daily newspapers within a district of eight miles.

HELENA, MONTANA, proposes to have a $20,000 gold and silver refinery in addition to the present assay office.

THE *Observer* says that around Grant's Pass, Oregon, miners are paid from $1.50 to $3.50 per day, according to skill.

ALREADY on the Colville, Wash., reservation there are 500 claims recorded in Stevens Co., and 250 in Okanogan Co.

AT Newcastle, Colo., the last two bodies of the forty-nine who lost their lives in the Vulcan mine disaster have been recovered.

THE little mining town of Northport, Wash., at the Canadian boundary line, was almost totally destroyed by fire last Saturday.

THE Senate Committee on Territories has ordered a favorable report on the bill admitting the Territory of Arizona to statehood.

IN the last ninety days the Colorado Secretary of State has turned into the State treasury $133,000 fees for mining incorporations.

THE Amador *Record*, reliable and enterprising, published at Sutter Creek, Cal., has entered upon the sixth year of a prosperous existence.

NEVADA COUNTY, CAL., has recently contributed $500 to the California State Miners' Association, and added 200 names to its county membership roll.

OVER fifty experienced miners left here last week to handle mining properties in South Africa, South America, British Columbia, Colorado and elsewhere.

A TON of black sand was this week sent from La Porte, Cal., via New York, to Berlin, Germany, where a new process will be tried to extract the gold therefrom.

UTAH mine and smelter owners oppose the proposed eight-hour mining law in that State. They claim it is a blow at the low-grade mine and miners' wages.

A LARGE PARTY of Utah miners, led by W. H. Chapman and W. C. Snyder, leave Salt Lake next month for Venezuela and British Guiana, there to hydraulic for gold.

PETER WYBORG is again in Juneau, Alaska, en route to the Yukon. He distinguished himself last fall by bringing out $45,000 in gold dust, all the result of his own labor.

THE House Congressional Committee has favorably reported a bill making the California Debris Commissioner a member ex officio of the United States Debris Commission.

A SIERRA COUNTY paper declares that "citric acid is successfully utilized in separating the gold from the auriferous black sand with which the beds of the Yuba streams are filled."

OF all fool rushes the present exodus to Alaska is the most foolish. Nine-tenths of those going have little idea what is in front of them, and the sum total of hardship and death will be a grave one.

ARSENIC AND ARSENIOUS ACID in Mercur, Utah, ore, has so far militated against the best obtainable results there from the cyanide process, and present efforts are making to overcome the difficulty.

IN the window of Shreve & Co., Market street, this city, is a nugget worth $1,003, picked up by J. C. Murphy at Kelsey, El Dorado Co., last week. A few days previous he got a nugget from the same claim worth $618.

A LATE RULING of Secretary of the Interior Smith is to the effect that a corporation organized under the laws of a State is in contemplation of law a citizen of the United States, and as such can take and hold by assignment a mineral entry.

IN the map on the first page it says "scale 40 feet to an inch." That was the scale on the original map from which the illustration was engraved, but the necessary condensation makes the scale in the engraving about 350 feet to the inch.

ASSAYER BRADEN, in charge of the United States Assay Office, Helena, Mont., reports the production of precious metals in that State for the year 1895 was: Gold, 209,320 fine ounces of the coin value of $4,327,040; silver, 17,701,658 fine ounces of the coinage value in silver dollars of $22,886,992; copper, 201,093,992 pounds, of the value of $21,114,-892; the lead output he places at 24,139,504 pounds, of the value of $754,350.

SOUTH AFRICA gets its best miners, mine managers and mine superintendents from California, and now Cornwall, England, is sending to South Africa for mine managers, who, the Cornwall papers say, "are revolutionizing Cornish mining."

LAST year the Etna Con. Quicksilver Mining Company produced 3,300 flasks. The sales were $115,241: expenses, $83,632; net profit, $31,692. Two dividends of $10,000 each were paid. The balance to profit and loss account on January 1st of this year was $43,235.

THE mill constructor for the Simmer & Jack, South Africa, Gold Mining Co. is reported here engaging carpenters and mill men for the new stamp mill his company propose building at Johannesburg. When this is complete and in operation it will be the largest concern of the kind in existence.

E. A. WILTSEE, just back from Johannesburg, South Africa, says the average recovery of values is from 9 to 10 pennyweights from the plates and from 3 to 4 from the tailings. The average working expenses for mining, milling and cyanide is in the neighborhood of about 24 shillings, or $6.

THE Colorado Springs correspondent of the Denver Daily *Mining Record* says while it may read like fiction, it is nevertheless true, that it costs more to furnish water for steam plants on Gold Hill than it does coal. At present Gold Hill plants are paying $3 and $3.50 per load of eight barrels for water for their boilers.

THE January output of gold at Johannesburg, S. A., aggregated 148,178 ounces; for the preceding December it was 178,-248 ounces; November, 195,218. The highest any one month was August, '95, when the total was 203,573 ounces. Lack of labor facilities and temporary political troubles are the reasons assigned for the temporary decrease.

NEARLY $50,000 per month is now paid out for mining operations in and around Jackson, Amador Co., Cal. On the Oneida, Gwin and Argonaut mines it is calculated half a million dollars will be put in reopening and developing. At the Gwin Superintendent Thomas has rigged up a boring machine of his own invention, and used it successfully.

STRONG representation has induced the Victoria, B. C., parliament to reduce the tax on mines from two per cent on the gross output of the mine, as at first proposed, to one per cent on the smelter returns of the mine. This in effect is the same as cutting the tax down to one-third the proposed amount and it is thought will save the miners $500,000 a year.

TWENTY years ago the United States Government bought the output of the bonanza mines in Virginia, contracting for $30,000,000 worth of bullion. Greenbacks were selling in New York for 88 cents in gold or silver coin. Government bonds were paid for the bullion, the "battle-born State" being next to California, then the financial backbone of the Government.

MISS JENNIE HILTON of Pomona, Cal., who has cleared $35,-000 in mining operations in Arizona and elsewhere, is no longer "the only woman in the business of buying and selling mining claims." Miss A. M. Orcut of Palmer, Mass., another "new woman," is prospecting near Pike's Peak, Colorado, has thirty locations, eight men doing assessment work, and is reported by the local paper to have sold a claim last week "for $4500, cash."

ACCORDING to the *Index*, this "goes" at Bodie: "Locators of mining claims must be prepared to pay the County Assessor $2.50 on every new location made in the county during the years 1895-6. The presumed valuation of mines is $100. On this basis of valuation a charge of $2.50, the pro rata of the general county assessment, is due. If the locator refuses to pay his $2.50 anyone may file a relocation, and, under the statutes governing claim abandonment, take up the locator's property."

A DISPATCH from Johannesburg is published in London saying that John Hays Hammond, the American engineer and member of the reform committee, now on trial, repudiates letters to American newspapers purporting to emanate from prisoners. It is added a fresh outcry is being raised against the alleged Americanization of the Rand by mining magnates, who, it appears, have been placing machinery orders in the United States instead of England. Directors of English mining companies are also directors of American mining machinery companies.

THE mining bill, which has passed the Utah legislature provides that all locators of claims, either placer or quartz, must do 160 cubic feet of work within sixty days after location. The claim must be staked within ten days and recorded within twenty. Each claim of a group must be recorded as belonging to the group and work may be done on one claim for all, but in this case notice must be posted at the location of each claim, stating where the work has been done. Relocation is also provided for under certain conditions. The old system of recording is not changed.

A SANTA ANA, Orange Co., Cal., subscriber asks: "Can a locator of a mining claim ask for and receive a Government patent for the same any time after performing $500 worth of work and improvements thereon, or must he wait five years?" No time is specified in the statutes. All that is required is that at the time of filing the application for the patent, or any time thereafter during the sixty days of publication, the claimant shall file with the register the United States Surveyor-General's certificate that labor or improvement to the value of $500 has been put on the claim.

AFTER considerable research Colorado's Attorney General has discovered that there is no statute law in Colorado covering the question of what shall constitute a water appropriation for placer mining purposes. He is of the opinion that since the State has no law regulating the appropriation of water for placer operations, the custom in the old California days should hold good—that a water right in placer mining belongs to whoever makes the prior legitimate location, and that to make this location it is necessary to do actual work, such as making surveys for the ditch, and following this up by constructing the ditch and doing actual work on the location.

ERIE, WELD CO., COLO., reports that if the coal war has been a boon to consumers, it has also been death to the miners, bringing a reduced income, a bare subsistence in all cases, and destitution in not a few. The winter has not been a favorable one for the coal miners; weather mild and demand correspondingly light. Hence the miners earned small wages, not to exceed $25 per month. A great many have earned nearer $10 or $12 a month. Close upon this condition of affairs came the coal war, and the gradual drop in price from $4 per ton down by degrees to $2.40. Now the mines have practically all shut down. Some of the large companies are owing their men from one to two month's pay. The merchants are not able to carry the burden cast upon them, and already some have been forced to the wall.

ON March 3, 1891, Congress provided in chapters 559 and 561, second session of Fifty-first Congress, "That suits by the United States to vacate and annul any patent heretofore issued shall only be brought within five years from the passage of this act." This limitation as to patents before 1891 therefore expired on March 3, 1896, and the title to all such tracts is now absolute and indisputable. The present Congress, house bill 5474, extended the time within which suits might be brought to annul patents, but these were limited to those issued under a "railroad, Mexican, Spanish or other special grant."

THAT silver's prestige is slowly but surely advancing is revealed in the fact that dealers and speculators have abandoned futures and that they are now on a single quotation holding silver bullion as a staple the values of which for commercial and monetary purposes are coming together. When the demonetization of silver in India came in 1893, it was followed by two quotations, one spot and the other future. Since that event the future of silver has been invariably discounted and rules ¼c lower than spot quotations. On March 10th dealers in Salt Lake, Utah, reports the *Tribune*, began to receive advices that spot was the same as the future delivery of silver bullion, and there has been no digression from it since that date. Friends of silver look upon this as premonition of better times for silver, and local smelters are governing their purchases accordingly.

FURTHER complications have arisen between the Miners' Union at Virginia, Nev., and the new management of the Hale & Norcross. Last Saturday morning H. W. Tangerman, the superintendent appointed by the officers and directors of the company, was taken out of a barber shop in Virginia, where he was being shaved, and placed in a buggy. Escorted by about fifty miners and others, he was driven to the county line and threatened with violence if he returned. He continued on to Reno, where he made application to the U. S. District Attorney for protection. The mine is idle and there is a deadlock between the management, who say Tangerman will superintend operations, and the miners, who say he won't. Comstock residents are making a mistake. The mythical man who killed the daily provider of gold eggs was a marvel of prudence and sagacity alongside the man who denies himself or his fellow miners the present privilege of working in a mine for $4 a day, in the only $4 camp in existence. The $4 per day wage rate has received a hard blow in the house of its friends.

THE original articles in the MINING AND SCIENTIFIC PRESS, written by miners, metallurgists and others in every walk of life, form one of its most distinctive features. In this number, for instance, is an article on Rhodesia, South Africa, by Mr. W. St. Auburn, M. E., formerly superintendent of the Niagara mine, at French Gulch, Cal., now consulting engineer for the Rhodesia E. & D. Co., Buluwayo, South Africa; an article on "Matte Smelting," a partial critique of recent publications, by W. L. Austin, Ph. D., of Denver, Colorado, himself an authority on pyritic smelting; the full decision of Judge Beatty in the recent celebrated Carson Creek-North Star case; comment on the California State Mining Bureau by a central California miner. Next week will appear what is believed to be the best description yet written of Cripple Creek, Colorado, from the pen of T. A. Rickard, State Geologist of Colorado; and an article on "Invention—The Indefinable Requirement of the Patent Law," from W. H. Smyth, of this city, whose recent kindred essay, "Is the Inventive Faculty a Myth?" was copied and commented on in every corner of the civilized world.

REGARDING the tall new building in process of erection for the *Call*, corner Third and Market streets, this city, a Baker City, Or., subscriber encloses a printed slip stating its dimensions, height, etc., and asks if such is correct, and if so, will not winds and earthquakes make it unsafe. The statistics concerning its height, etc., are correct. Its manner of construction precludes probability of disaster from any cause. Similar buildings, erected in a similar manner, are unaffected by wind. In the 1895 edition of Kent's "Mechanical Engineer's Pocket Book," pages 493 and 494, is an elaborate discussion on wind force or pressure on buildings, from which it is fair to assume that in this city, in that location, and for a building like the one under discussion, the greatest probable wind force—eighty miles per hour—would exert a pressure of twenty pounds to the square foot. Assuming a height of 300 feet and a frontage of 50 feet would give one surface of 15,000 square feet over which would be unequally distributed a maximum pressure of 300,000 pounds. The steel girders, the skeleton system of construction of such buildings with ashlar stone fronts and rigid bracing throughout makes such wind pressure of no moment. Sometime ago the writer of this paragraph was in a friend's office in the top floor of the Masonic Temple in Chicago, during a heavy "blow," a stronger blast than ever sweeps across this city, and it wasn't noticeable in the least. The matter was discussed and the statement made that no wind, however furious, made the slightest vibration. That building is 302 feet high, nineteen stories—twenty-one including the promenade on the roof—has a frontage of 170 feet on State street and 114 on Randolph, and is considered a good illustration of the solidity of such structures. As to the earthquakes it is believed that the system of construction of such buildings makes them earthquake-proof. The whole building, from foundation to roof, is so rigidly put together, bolted, braced and interlocked, that it is practically one piece. An earthquake would shake it, probably cause it to rock, but unless the ground on which it was built gave way, opened or sunk, it is unlikely that the result of even a severe earthquake would occasion any damage. The big earthquake of October, 1868, spared a good many buildings that were not nearly as well put together as are now the Palace Hotel, the Mills Building, the Chronicle office, the Crocker Building, or the Emporium, and it is likely were San Francisco to be badly shaken by an earthquake those mentioned would be among the least injured. As to winds and earthquakes there is no part of the Union less liable to injury therefrom than this section.

## Gold Mining in Rhodesia.

Written for the MINING AND SCIENTIFIC PRESS by W. T. ST. AUBURN, Consulting Engineer Rhodesia E. and D. Co., Buluwayo, South Africa.

Of all the various quests for minerals, to the ordinary man none is so fascinating as that of the search for gold. In hunting for coal, copper, silver or other minerals, while experience can point out the proper conditions for the existence and the trained eye can often detect the presence of the object sought for, yet the tests to make sure of the valuable bodies being there are not of the simple nature of those for determining the presence of gold, and the reward for finding a deposit that is worthy of exploitation seems far off to the prospector when looking through the wrong end of a telescope composed of initial development, mining expert, company flotation, commercial development, reduction equipment and dividend distribution, whereas the grains of gold in his pan, seen through the lens of his pocket magnifying glass and his imagination, speak to him of immediate returns of what is money itself, needing no paraphernalia for its transmutation. Perhaps in that pan he might be holding a nugget, and at once the alluvial bar, over which he casts his eye, calculating its extent, and from which he has but just washed that panful of dirt, is alive with nuggets—and not small, ordinary nuggets like the one he is looking at, for why should he have washed the biggest one at the first trial panning, but "Welcome Strangers" or "Blanch Barkleys"—or should the panning be from a piece of float quartz bruised to dust between a couple of stones, the gold prospector knows that the possibilities of a "dolly" or an "arrastra" place him in a position to work out his own salvation without extraneous aid. At least, such are the circumstances of gold prospecting in nearly all the countries where gold has been found and worked to a profit up to the present day; and no doubt it was the fascination of this prospect that brought the first gold seekers into the Province of Rhodesia. And of all countries in the world nowhere was there to have been found a surface so redundant, I might say, so saturated with gold; and yet the prospector of Rhodesia is not happy to-day, for after enduring the hardships of pioneer travel, of actual warfare, of poor food and unhealthy climate, he finds that the country which should have rewarded him handsomely for all his pains and toils has been ransacked by some earlier bird, who has got the golden worm, leaving but the form or skin, as it were, of the ornithological delicatessen behind in the shape of the well known "old workings." How long and weary a struggle the pioneer prospector would have had to endure in this his favorite quest for gold, is past the power of human telling, but fortunately for him this wide Rhodesian gold field, robbed and debauched of its virginity, became, as have other entities in similar condition, the fashion, and men of wealth and position—no, I mean companies and syndicates of financial strength and influential connections—have scrambled to possess the leavings of the former lord and master, believing that all the sweetness cannot have been secured in the salad stage; conscious of superior power, of better appliances and a better knowledge of the earth's anatomy, the modern has no doubt of his ability to take up the quest for riches where his forerunners abandoned it, and to get reward where the ancient either failed or being satiated with possession had become enervated for further effort; he does not perhaps expect profit abinitio, as in other countries, but that he will be victorious in the end he feels so certain that he is not satisfied to merely "grubstake" the prospector, but freely buys any location he may have made on even the smallest "old working," and in many cases permits his enthusiasm to name the price.

In comparing these northern gold fields of South Africa with others, this then is the great difference to be noted: Whereas elsewhere the prospector "foreran the royal camp" of promoters, brokers and share speculators, and by the sweat of his honest brow and the strength of his good right arm earned for himself an independence, only giving place to syndicate or company when he had demonstrated the value of his ground and his nomadic spirit urged him "to seek fresh woods and pastures new," here, along with the prospector, must travel hand in hand the middleman, for nowhere can the former find the "actual stuff" to give him even the poorest living, but must content himself with pegging off the empty shell of some "old working" and then handing it over to his companion-in-alms, the promoter, must await the successful begging of the latter in making a flotation. Here in Rhodesia are, so to speak, the self-same gulches that in California or Australia would have supported each its own little community. But, alas, here is no "busy hum of men," for the level lips of the ravine are pock-marked and even the cheeks of the adjacent hills have lost their "bloom," for the ancient has "spread his wings on the blast and breathed on the face of the 'earth' as he passed," and his irritating little shafts are everywhere and so close together that nought remains at or near the surface that will pay our up-to-date prospector to work. So, cursing his luck and the bygone race, the pioneer would feel very much behind the times if it were not that he can sell his "rights" to an ever-ready buyer and so have the wherewithal to continue his peregrinations. I call this buyer an ever-ready one, but in this I am led by the actions of the buyer of the past, and I am not so sure that the buyer of the future will be so lavish with his cash or his undertakings because he is beginning to learn that the exigencies of proving a prospect require a personal ownership of the worker, who must be ready to work early and late and have an unbounded faith in his property in order to get the best conditions for successful development. And under the conditions in Rhodesia to-day this great incentive of ownership and belief in the property does not exist, and the result is a lax state of affairs most prejudicial to the best interests of the property and its speedy exploitation. Under these circumstances the prospector rushes over the country, not laboriously picking out by means of his pick and pan promising prospects, but pegging any "old working" that he may run across or have pointed out to him by natives, who are anxious to show him any that they know of in exchange for a "tusa," consisting of an old gun, warranted not to fire straight, a couple of blankets or an old shirt whose only parts in complete repair are the button-holes; and then, after disposing of his claims to some syndicate, he stands ready to take a contract at high figures to oversee his "boys" excavate the amount of opening required by law. The effect of this will probably be a lessened avidity to make purchases in the future.

In speaking thus of the present system of prospecting and exploiting in Rhodesia, I do not overlook the fact that there are exceptions where honest work is done and intelligent quest conducted, but these are but the exceptions that prove the rule, and in the vast majority of cases the modus operandi is as I have outlined above. Some of the syndicates and development companies have, however, gone beyond this stage, and in some cases are now conducting operations on a scale befitting their objects and in a style worthy of the properties they own. That the country should have furnished ore deposits that have survived these extravagant methods would speak highly for its future if these ores had satisfactorily stood the test of a mill-run; this has yet to come. In the Penhalonga, the Enterprise, the Salisbury, the Abercorn, the Beatrice, the Dunraven, the Bonsor, the Tebekwe, the Pioneer, the Queen's and the Ayrshire, the country can show properties that have gone beyond the initial stage, and in some of these the amount of ore in sight can be reckoned in thousands of tons. In numbers of other properties the showing is quite promising, and much exploratory work is being carried on that will without doubt lead in many cases to the uncovering of good ore bodies. To give a list of these would be burdensome and premature.

In comparing the gold occurrences in situ with those of other countries we are handicapped by the fact that, except in the few cases of "virgin" reefs, the outcrops have all been previously mined, and while we can see and determine the character of the enclosing rock, we can only tell what the matrix of the reefs is where the "old workings" have been bottomed or the reefs cut below them. In these cases the matrix usually is found to be, as elsewhere, quartz, but it has been a not infrequent experience to discover that the reefs mined by the ancients were composed of some other material; thus in the Ayrshire the matrix was found to be a diorite, in the Gaika a soapstone, in the Johnson of Manica a kaolin, and I have noted other cases where the occurrence may be classed as "abnormal." Hence it is too early yet to state definitely what we must look upon as constituting the Rhodesian ore bodies and what the prospector must look for as indicating his best chance of success. A similar state of uncertainty prevails with regard to the enclosing rocks and the character of the reefs themselves; there have been opposing opinions given by the various geologists and mining engineers who have visited the country. To some the veins are, as one celebrated engineer of Johannesburg expressed it to me, "mere whip-lash veins on the surface;" to others, they are "true fissure veins;" to others, "seggregation" or "substitution" veins, while yet to others, they are "interbedded" veins. Probably there exist some veins of all these different classes, and while some are more or less fugitive, others may be regular and permanent; further, I believe that we shall find occurrences that will not come under any of these heads, where gold will be found in payable quantities, under conditions not before observed in other parts, and as the Witwatersrand series astonished the world, so some to-be-discovered Rhodesian deposit will set the scientific coterie agog to account for the possibility of its existence. The old miner's adage that "Gold is where you find it!" never had a country that more fully exemplified its truth. It is difficult to find a spot from which a pan of dirt can be taken that will not show "the color," and some spots that I have tried have shown some remarkable results. My advice to all Rhodesian prospectors is to not rest content with trying the recognized gold-bearing rocks, but to pan every kind of rock in sight. Of the enclosing rocks but little need be said, for although they are those that elsewhere have been considered the home of the rich pocket and the elusive seam, still they are those that have always been considered gold-bearing; and as each district has its idiosyncrasies and each country its own characteristics, so it may remain for Rhodesia to prove that under favorable conditions the granitic and schistose formations may produce reefs of great permanence and sustained value.

It remains but to mention alluvial deposits, and as most of the gold quest has been hitherto made in the "high veldt" and at the headwaters of the streams, these deposits as so far known consist of shallow gulch gravels and detritus from the reefs; these have all been gutted by the ancient miners. Whether any gravel banks exist similar to the ancient river channels of California is an open question, but if they do exist they must be sought in the lowlands where the mountain streams empty into the valley of the Zambesi, a country but ill adapted to the well-being of the white man. Along some of the rivers of Manica are bars and shallow banks that will probably pay to work by hydraulic washing, but the fall of these rivers is generally too flat to permit of the most economical working. Similarly on the lower reaches of the Mazoe, the Luia, the Hunyani, the Umfuli, the Sanyati, the Shangani, the Guay, and their tributaries, bars and banks may exist that will pay to wash, if the climate will permit.

In conclusion I would point out that in gold mining, as indeed in all mining, the surrounding conditions are what govern the question of whether a deposit will pay to work or not. An ore body may be never so rich but what, if the conditions are unfavorable, it will fail to be remunerative. These factors in gold mining are cheap timber, water, fuel, labor and, in a lesser degree than in other mining, but still of importance, transport. Rhodesians believe that they have the gold, that they can demonstrate and have demonstrated that it exists in their country in quantities and in grade of value that in other countries has been commercially remunerative, but the thoughtful among them are not so ready to affirm that the other requisites to success are present. In nearly all the various districts timber exists in fairly large quantities and fairly conveniently situated to the mines, but most of this is subject to the ravages of insects that abound, and the varieties that are resistant to these ravages are far from plentiful and their wood is not easily worked. For fuel for some time to come the poorer timber will furnish an adequate supply, and when the supply fails it is possible that coal may be found to take its place, as reports of several discoveries are rife. For water, the mines are generally well situated, and as most of them must be worked by shaft they will perhaps furnish their own water supply for the batteries by means of pumps in the mine. In some cases water power is available, notably in the Manica gold field. It may, therefore, be considered that in these essentials the mines of Rhodesia will be as well off as the average of mines in other localities. It is, however, in labor and transport that the danger of failure lies. At present the native labor market is in a very disorganized condition; great scarcity of "boys" is everywhere reported. This may be in part due to the season of the year, which is that of the sowing of crops and the tending of gardens; but I do not believe that it is due entirely to this cause, and unless proper steps are taken for the regulation of this market, so that a steady supply of laborers can be obtained, I foresee grave trouble. White labor, too, is scarce and high-priced, but this, I have no doubt, will remedy itself as the country becomes more settled up and a securer feeling in its future more widely felt. In dealing with the question of transport there is only one thing to be said: it is simply prohibitive; only the richest deposits can possibly be profitably mined at the present rate of transport and the cost, delivered at the mines, of the necessary supplies. It is useless to go into details until an amelioration takes place; the country as a whole can not be a successful mining community. In this paper a discussion of the new mining law, as recently promulgated, would be out of place, and while it may work hardship if rigidly enforced, I believe the interests of the Government are too much bound up in the success of the mining industry for it to be a permanent trouble, and I am as sure that alterations in the law will be made as their necessity becomes apparent.

Buluwayo, South Africa, Jan. 30, '96.

---

ACCORDING to general report the Cook's inlet, Alaska, tides are terrors. They travel, it is said, with the swiftness of a Johnstown flood. They rise and fall a distance of 47 to 49 feet. They will carry out a schooner or vessel eighty miles in four hours. Turn Again Arm is said to be a narrow continuation of Cook's inlet and turns from the inlet easterly almost at right angles. In that part the tides are said by some to sometimes rise 60 feet. It goes like a moving wall. It is up the Arm on the southerly side where the best placers are found.

## The Usefulness of the Mining Bureau.

TO THE EDITOR:—In view of the increased interest manifested in mining and the renewal of energy and investment of capital in that direction, comes a demand for more general information on the subject—a demand which the Mining Bureau, under its present organization and system, is supplying the miner and the capitalist with much valuable information and data.

The Mining Bureau from time to time issues bulletins written in simple and plain language easily comprehended, and such are illustrated with cuts. Among these recent bulletins are the one on "Mine Timbering," by W. H. Storms, one of the Bureau assistants, "The Cyanide Process," by D. A. Scheidel, who has supervised the erection of cyanide plants in Australia and Africa; the bulletin on "Mill Practices," by E. B. Preston of the Bureau, which is one of the most useful publications to the millman, describing, as it does, with illustrations, every part of a milling plant of modern pattern as well as the best methods of amalgamating every description and variety of ores. In addition to these useful guides to the miner, the Bureau has in hand and will issue a pamphlet on "Mine Drainage Pumps, Etc.," to be followed by other equally valuable information for the miner.

The Mining Bureau has distributed over twenty thousand of these instructive pamphlets, which have drawn from the mine owners and operatives the heartiest approval, and applications for them are received almost daily from every part of the world, particularly Africa, Australia, Colorado, Montana and Idaho. In addition to these bulletins, the bi-annual reports have brought the attention of capitalists abroad to the opportunities for investment, and have been the cause of bringing hundreds of thousands of dollars to the State. Capitalists eagerly seek information from the Bureau, and the visitors run up into thousands weekly—seekers for information. It is rapidly assuming an important source of information to the miner and parties seeking investment in California mining properties, and through which the mine owner and the capitalists are brought together without expense to either.

It is to be hoped that the next Legislature will appreciate the influence of the Mining Bureau in behalf of the miner, and the attraction of capital to the State leading to the revival of mining, and putting into active operation hundreds of undeveloped mines that have lain dormant for the want of necessary capital, all of which brings money into circulation in the State and furnishes employment to the army of idle miners.

What the Mining Bureau needs is liberal appropriations to enable it to carry out the energetic policy of its present administration, which is only limited by want of the necessary funds to diffuse such information to the miner in the way of the issue of bulletins as will save him time and expense in operating his property. Already the publication of the bulletins, which the limited means of the Bureau has enabled it to issue, has earned the grateful commendation of the recipients and urgent requests to continue the good work which a small addition to the usual appropriation will enable it to do.

Mining has experienced such a revival as to become the prominent interest of the State, and every encouragement should be given to its fostering through the spread of such publications as will call the attention of foreign capital to the inexhaustible wealth that needs but capital to develop and furnish employment to the miner; for, although it is to be regretted that our local capitalists are so slow to take advantage of the opportunities, it is of interest to the general community, as well as the owners of undeveloped mines, to induce foreign capital to invest in our mines, putting money into circulation for labor and mining machinery purchased here. It is only the surplus or profits that go abroad, and this loss to the State is of less importance when it is considered that, except for the working and development of these otherwise dormant properties, no part of the gold they contain would be put in circulation. Therefore, every dollar appropriated to bringing the attention of foreign capital to investment in our mines is returned a hundred-fold to the State. Every facility and every honest and proper effort should be made to inform the world of the wealth of our State that only needs capital to develop, for it is too well known to need mention that we have hundreds of millions of dollars awaiting the magic wand of capital to put into circulation.

The Mining Bureau is becoming one of the most popular and important institutions of the State, and every facility should be given it to continue and enlarge its sphere of usefulness. The effect of the present system of diffusing information is being felt throughout the entire State, and meeting with the approval and endorsement which it deserves for the good it is doing in the most economical way, with the limited appropriation available. MINER.

Stockton, Cal. March 20, '96.

## Matte Smelting.

Written for the MINING AND SCIENTIFIC PRESS by W. L. AUSTIN, Ph. D. Denver, Colorado.

The appearance of Mr. Herbert Lang's work bearing the above title is all the more opportune because of the renewed interest which is being taken in this subject on account of the preparations now being made for the introduction of the matting process at Iron Mountain, in Shasta county. It is proposed to treat the ores of that mine by this process upon a large scale. As Mr. Lang is the metallurgist in charge of the construction work now going on at Keswick, it is most interesting to learn his plan of operations in advance of actual results, as one is thereby enabled to follow intelligently the development of the methods he advocates.

Mr. Lang has put much painstaking work into his book; and, although it is impossible to agree with him in some of the deductions to which he has been led by his own experience and research, possibly if others had had similar opportunities for forming opinions, they might have reached the same conclusion. At any rate, Mr. Lang's book may be read by his professional colleagues and by those interested in the subject treated with benefit to themselves.

The importance to California of matte smelting is very great, because distributed along what is known as the copper belt of that State for several hundred miles in a northwesterly and southeasterly direction are numerous deposits of mineral which may be treated by this method, whereas it is doubtful whether they can be handled profitably by any other metallurgical process at present in use. Since the middle of the sixties, the exploitation of many of these mining properties has been undertaken from time to time; but except during the period of very high copper prices, the results have usually been financially disastrous. Attempts at matting these ores are by no means novelties; they were made as early as 1865 and repeatedly since that date, but for reasons which it is not necessary to go into at this time (and which will be apparent to the experienced metallurgical engineer who takes the trouble to look into the matter) none of them are believed to have been successful from a dollar and cents point of view.

This state of affairs is not as it should be. California is rich in copper-bearing ores which are amenable to modern methods of metallurgical treatment, and there is no reason other than the inertia of the owners of these properties themselves why California has not, during the past decade, become one of the great copper-producing States of the Union. Therefore, it is to be hoped that the work now being done in Shasta county may open up the way to a new era of prosperity along the aforesaid copper belt and result in the working of other promising properties which have too long been allowed to lie idle.

For a long time it has been thought that the Californian copper ores, as soon as the oxidized surface zone is passed, are refractory and too low in grade to handle at a profit; but such views have arisen from a lack of information in regard to metallurgical progress elsewhere than on the coast. Complex, heavy sulphide ores are now considered very easy of treatment, and yield larger profits than were formerly obtainable from oxidized ores of equal grade. California metallurgists lead the world in the milling of gold and silver ores and are eagerly sought after by foreign corporations owning deposits of mineral which may be worked by milling processes; but this department of metallurgy has been built up on the coast at the expense of other branches, and this is especially noticeable in all that pertains to the smelting of ores. Sulphides, very similar to those found along the copper belt, are now being calcined (roasted) and smelted into matte for less than $3 per ton of ore, and this is done in localities with which California compares favorably with reference to costs of fuel and labor.

Granted that it is a debatable point whether or not, even with matte so cheaply produced, some of the California mines could be profitably worked if the operation were stopped at that point, still it is now an easy matter to convert such matte into metallic copper by means of the Manhes process or other well-known metallurgical methods. Wherever water power is available (and California is liberally supplied with such power by the many streams which flow down from the Sierras through the mining regions), the cost of converting the matte into crude copper should not exceed $6 per ton of matte and ought to be done for less.

To mine and transport ore from the mines to the furnaces should not cost over $3 to $4 per ton along the copper belt, and in many cases would not reach this figure, all dead work included. Assuming that such a raw sulphide ore carries seven per cent copper, and that in reverberatory matte smelting fifteen tons of ore are concentrated into two tons of matte, and that these two tons of matte are converted into one ton of crude copper by the method indicated above, the total cost of producing this ton of crude copper (98 to 99 per cent fine) from the ore should not exceed a total of $57 per ton of copper, or $3.80 per ton of ore. Even better results than these should be reached by other methods of reduction, notably by pyritic smelting; so that crude copper should be produced from the seven per cent ores of the California copper belt at from five to six cents per pound of copper at the outside.

Nor is it necessary in accomplishing such results to have recourse to hypothetical or untried processes of reduction, but simply to reproduce in California operations which are everyday matters in other mining regions. At one large establishment in the Rocky Mountain section heavy sulphide ores are calcined and smelted into matte for less than $2 per ton of ore; not spasmodically nor in small batches, but on a basis of several hundred tons of mixed ores per diem every day in the year.

The operations at Iron Mountain will, therefore, be watched with unusual interest, and the working of the smelting apparatus installed by Mr. Lang will be carefully noted, because of their bearing upon the prospective value of the undeveloped metallic resources of the State. It is very much to be hoped that Mr. Lang will, from time to time, favor the readers of the MINING AND SCIENTIFIC PRESS with accounts of the extent to which he finds fact to correspond with theory in the problems he is working out. Discussion of technical and scientific matters invariably results in benefit to all concerned. This is markedly instanced in the advance made of late years in the metallurgy of iron and steel, which advance is largely due to discussions of matters bearing vitally upon those subjects, in papers and at the meetings of technical and scientific societies. It is much to be regretted that the same lines have not been followed out in other branches of the profession, for if they were, the diversity of views held by different metallurgists would be moderated in exactly the proportion in which the actual facts became general knowledge. The truth is what is wanted, not the views of any one individual based upon a more or less limited experience, and the truth can best be reached by a combination of the experiences of many.

In view of the prominence that has been accorded the name of the writer in Mr. Lang's work, it becomes obligatory on the part of the former to correct some of the statements made therein, especially with reference to the writer's own work. This is not done, however, in an unfriendly or hypercritical spirit, and if in a subsequent article some of the theses advanced by Mr. Lang in his book are commented upon, it will be merely in the effort to correct what are considered as errors due to insufficient, or incomplete, information furnished the author from sources which he was not able personally to look up. If in this way it is possible to throw additional light upon a subject concerning which the statements of current writers are exceedingly misleading, the principal object of these articles will have been attained.

Before taking up in detail some of the questions raised by Mr. Lang's work, a few remarks upon the nomenclature made use of by metallurgical writers in treating the subject of pyritic smelting would perhaps not be out of place. The use of different terms to express the same idea tends towards confusion. This is particularly true in the case of the casual reader not familiar with the subject that is being treated. For this reason it is well not to complicate matters by introducing a new terminology into the subject of matte smelting, especially when the terms already in use are sufficiently explicit to cover the whole subject.

Pyritic smelting is a term borrowed from Percy (see Percy's Metallurgy of Gold and Silver, Part I, page 531), and was used by him to designate "The smelting of silver ores, which are either free from lead or do not contain it in sufficient quantity to collect the silver, in conjunction with pyrites, in order to produce a regulus in which the silver may be concentrated." It is assumed that Percy limited the use of this method of smelting to silver ores, for he called it pyritic-silver smelting, and it is inferred that he considered an iron matte as a fairly efficient vehicle for collecting silver from dry ores when lead was not to be had in sufficient quantities. Pyritic smelting, then, according to Percy, differs from other methods of smelting solely in regard to the vehicle of collection. No reference is made to copper in the definition, and it is probable that where ores contained that metal it was intended to treat them as properly belonging to the methods of reduction coming under the head of copper smelting.

But the collection of valuable metals in an exclusively iron matte is for various reasons not practiced to any extent at the present time, and therefore we have in the term pyritic-silver smelting a rather comprehensive name affixed to what might be considered an obsolete process. For this reason it occurred to the writer to adopt the expression pyritic smelting in designating a somewhat different idea from the one for which Percy originally used it, omitting the word silver because, in the new adaptation of the name, the process described by it is applicable to the treatment of various other metals besides silver.

In a pamphlet published by the writer in 1889 the term pyritic smelting was first made use of to designate that method of smelting in which pyrites were not only made the vehicle for collecting the precious metals, but also the source from which the greater part of the heat necessary to carry on the smelting operation was derived. The use of the word pyritic to specialize a system of smelting in which the heat required in carrying out the operation is for the most part derived from the pyrites contained in the charge—in other words, in which pyrites are employed to produce fire—is a closer approach to the true etymological meaning of the word (which is derived from the Greek, signifying fire) than is its use in the sense of employing pyrites as a vehicle of collection. But, whether justified or not, the later signification of the term has now become its generally accepted meaning.

On account of the conflict of ideas which might occur from indiscriminate use of the term pyritic smelting in the sense in which Percy first introduced it and in that of its more modern acceptation, possibly it might be advantageously replaced by the expression sulphide smelting, first proposed by the writer a number of years ago; but as the operation which it is desired to define embraces the use of arsenides as well as sulphides, the word pyritic (because it refers to all kinds of pyrites) appears to more completely cover the case.

In this article the term pyritic smelting is used to designate a process of smelting in which the greater part of the heat used in fusing the slag and matte formed in the furnace is produced by the oxidation of the iron and sulphur contained in the furnace charge itself. Matte smelting, on the other hand, is used as a generic term for all systems of smelting, where matte of any kind is the valuable resultant product, whether in reverberatory or blast-furnace practice. Pyritic smelting is therefore a branch of matte smelting, but the terms cannot be employed interchangeably, because as a general thing in matte smelting matte is produced from ores which have been calcined down to the point where only sufficient sulphur remains to form the desired percentage of matte fall, and practically none is available for heat purposes. As illustrations of matte smelting might be mentioned the practice at the Anaconda works in Montana, where the calcined concentrates are fused down in reverberatory furnaces to a matte, or the smelting of raw and calcined ores to a matte in water-jacketed cupolas at Bisbee, Arizona.

The practice at Silverton, Colorado, however, where raw ores are fused to a matte by burning the pyrites contained in the charge, might be considered as pyritic smelting, but not as the highest development of the art, because the auxiliary heat supply used to effect the combustion of the protosulphide of iron is largely derived from the burning of coke in the furnace itself. The use of coke at all in a pyritic smelting furnace hardly recommends itself where it is not needed, nor is it requisite in the case of heavy sulphide ores, because as it is evident from an inspection of the Manhes process alone that the protosulphide of iron contains in itself the thermal units essential for maintaining a high degree of heat, therefore the addition of more fuel to a charge already amply supplied is of doubtful utility. But that the practice of charging coke with a pyritic ore charge which already contains more than sufficient pyrites to be self-smelting is adhered to at several works cannot be denied. The explanation of this paradox in the cases referred to is that the furnaces in which pyritic smelting operations are attempted are not suitable for the purpose to which they are put, and being designed for a different method of smelting, the addition of some coke becomes a necessity. The apparatus in which a given fuel is to be combusted should be constructed to meet the requirements of that special combustible. For instance, the residuum of a petroleum refinery is not a suitable substance for burning in a kerosene lamp, yet when sprayed from a properly constructed hydrocarbon burner, it shows itself to be an excellent fuel. A blast furnace constructed upon the lines of those used for smelting lead ores is just as unsuitable for pyritic smelting as a coal-oil lamp is for burning residuum.

In treating the art of matte smelting, the subject can be suitably divided into the following principal heads:

MATTE SMELTING.

| I. Ordinary smelting of ores into matte, in which carbonaceous fuel is used to supply the necessary thermal units. | | II. Pyritic smelting, in which the combustion of pyrites furnishes the principal source of heat. | |
|---|---|---|---|
| (*a*) Reverberatory matte smelting. | (*b*) Blast furnace matte smelting. | (*a*) Pyritic smelting, where the blast is heated externally or through combustibles introduced into the tuyeres. | (*b*) Pyritic smelting, where the blast is heated at the expense of carbonaceous fuels (coke, etc.) introduced with the charge and burned within the furnace itself. |

The variations in matte smelting may, in nearly every case, be brought under one or the other of these general heads. In any case, whatever the system of dividing up the subject may be, the distinctive feature of pyritic smelting, namely the use of the natural or artificial sulphides or arsenides as metallurgical fuels, should be made the dividing line between it and the ordinary matte smelting methods.

Mr. Lang, in his work, gives the following definition of matte smelting: "As the smelting of natural sulphides with the design of collecting their valuable parts in a quantity of artificial sulphides. Or, more explicitly, as the smelting of ores composed of, containing or giving rise to, sulphides, for the purpose of collecting their values in a less quantity of artificial sulphides."

In this definition Mr. Lang limits matte smelting to the smelting of natural sulphides. If, under this synonym, raw or unroasted sulphides are meant, which appears probable, then the matte-smelting operations at Butte, for instance, are excluded, because very little, if any, raw sulphides are smelted at that point without calcining. This statement applies to nearly all the large matting establishments in this country, and it is difficult to understand why Mr. Lang should limit matte smelting to the smelting of "natural sulphides" only.

In the book referred to reference is repeatedly made to the "German system" of matte smelting, under which title is meant (see pages 11, 30, and 57) the smelting of ore mixtures containing more or less unroasted iron pyrites, which, when melted, are intended to serve for the collection of the valuable metals. This method of smelting is identical with the one described by Percy under the heading pyritic-silver smelting, which has been already referred to and is the "silberroharbeit" introduced into the Freiberg works by Barthel Koehler in 1585 (see Plattner's Vorlesungen ueber allgemeine Huettenkunde, Vol. I, page 7). So the "German system" of matte smelting, "pyritic-silver smelting," and "silberroharbeit," or simply "roharbeit," are all one and the same thing, and are simple matte smelting. The process is minutely described in all the old text books and would be classified under I in the table given above. No attempt was made in this method of smelting to utilize the protosulphide of iron as fuel; in fact, it does not differ materially from ordinary lead smelting, except in the use of an iron matte (?) in the place of metallic lead as the vehicle of collection.

Mr. Lang further introduces into the literature of matte smelting such terms as "a practical cold-blast pyritic process" (see page 57), and "gradual reduction methods" (see page 84), or "gradual reduction processes" (see page 5). Apparently these terms are all meant to express one and the same idea, namely, pyritic smelting in which the blast is heated at the expense of wood and coke introduced with the charge, and they all would come under II. (*b*.) of the above table. Mr. Lang's "gradual reduction methods — hot blast" are simply pyritic smelting, and would come under II of the table referred to.

In writing upon any metallurgical subject it would seem unadvisable to introduce terms which may cause even those well versed in the topic under discussion to pause and wonder what they are reading about. The tendency should be towards simplifying, not complicating a subject.

Denver, Colo., March 20th, 1896.

## Notes on the Handling of Slags and Mattes at Smelting Works in the Western United States.*

By WILLIAM BRADEN, Helena, Montana.

It is obvious that the choice of the method to be employed in the handling of blast-furnace slags and mattes depends upon local facilities and conditions which may indicate as advisable some particular plan. As a result of the variety of such conditions, hardly any two smelters use identically the same method, though they be located only a few hundred feet apart. For instance, of the several plants in Leadville, Colorado, each has a more or less distinctive system. The same is true of Salt Lake City and vicinity. In view of this, it is evident that the existing diversity of practice cannot be accepted, prima facie, as evidence of the lack of wisdom at any one works, and the following account of the methods pursued at several leading establishments in the West is offered, without purpose of criticism, as likely to furnish for all parties useful material for consideration:

*The Boston and Montana Consolidated Copper and Silver Mining Company.*—This company has large mines in Butte, Montana, whence the ore is shipped in cars to Great Falls, 170 miles distant, for treatment. Such ore as is suitably high in copper is smelted in blast furnaces to a copper matte, carrying from 50 to 55 per cent of copper, which goes to the converters. These are as large as the average steel converter, the minimum charge being about 3 and the maximum 8 tons. The crude ore, too low in copper to smelt direct, is concentrated, roasted in Bruckner cylinders and reduced to 50 to 55 per cent matte in reverberatory tilting hearths. This matte, as well as the blast-furnace matte, is converted to "pig copper," which is either refined electrolytically on the spot or shipped for refining elsewhere.

The works, located on the north bluff of the Missouri river, some two miles below the city of Great Falls, occupy a well-nigh ideal site for a large smelting establishment, there being great water power and a steady slope of about 1 foot in 5, more or less, from the edge of the river for several hundred feet back. Switches of the Great Northern Railway run through the works at the top and bottom with convenient grade for unloading of ore, coal, etc., and for the handling of empty cars.

Fuel for the "Wellman" and the "Taylor" gas producers is supplied from the Sand Coulee coal mines in the Great Falls district. Water, to be used under head, is pumped to large tanks on top of the bluff above the smelter.

The ultimate disposal of the slag at these works is effected by granulation and sluicing away; but the method may be better explained by considering the handling of the slag from three more or less distinct sources, namely, the blast furnaces, the reverberatory tilting hearths and the converters.

1. The molten material from the blast furnaces is run continuously into a movable fore-hearth or settler, which is simply a rectangular box bound with cast-iron plates about 1 inch in thickness and lined with split fire-brick.

The matte (which is high in copper, thus assuring a clean slag) is tapped periodically, according to the amount being made, from a tap-hole some 5 or 6 inches from the bottom of the fore-hearth into an ordinary slag-pot. When this is full it is wheeled away a few feet and the matte is poured into molds. When cool, being in slabs of from 2 to 3 inches in thickness, it is easily broken to suitable size.

The slag from the fore-hearth overflows continuously (except while the matte is being tapped) into a jet of water under pressure, and is sluiced into the river, where it is carried by the current.

2. At the tilting furnaces, after a thorough fusion has taken place and the furnace is prepared for a separation of the slag and matte, it is tilted and a man with a long hoe skims the slag from the furnace into a trough, from which the slag is granulated and sluiced to the river like the blast-furnace slag above mentioned.

3. During the operation of skimming the tilting hearths a converter is also being skimmed into a large ladle of 10 tons or more capacity. When the skimming of the converter and the tilting hearth is finished, both are swung to normal position and the ladle carrying the converter skimmings is picked up by a 20-ton electric crane and carried to the tilting-hearth just skimmed, into which the slag is poured. By the cleansing on the "copper bottoms," so to speak, of the tilting hearth, lasting a few moments, I am told that the converter slag is reduced from 2 to 2½ down to 0.6 per cent of copper. After this cleansing the hearth is again tilted, and the slag is skimmed and granulated and sluiced off, as already described.

At other copper works in Montana slag is handled from the blast furnaces in much the same way where sufficient supply and head of water are available. But the slag from blast furnaces more generally run from the fore hearth into an ordinary slag pot, which is wheeled to the edge of the dump and emptied by tilting.

*The United Smelting and Refining Company.*—This company has near Great Falls, on the Missouri river, about 2 miles below the Boston & Montana Copper Works, above spoken of, works at which purchased ores are reduced to base bullion. The sampling works, roasters and ore bins, blast furnaces, engine room and boiler room are practically on the same level, which is that of a bluff above the river, where the furnaces are located, giving ample dumping ground for the slag. The slag flows from the furnace into a settling pot, and overflows into a Devereux pot, which is an ordinary slag pot with a hole about 1 inch in diameter on the front side. In this case the hole is very low down, about 4 or 5 inches from the bottom of the pot. These Devereux pots, when filled, are pulled some 150 or 200 feet to the edge of the slag dump and tapped by inserting a steel bar through the top of the crust and poking the same through the hole, which has previously been plugged with clay. Of course, when struck by the bar the plug of clay falls out, and the molten slag flows over the dump. If there happens to be any matte, it is saved in the portion of the pot beneath the hole. This is allowed to cool, and is then separated on the dump from the slag by men with "culling hammers." Usually there is between the slag and matte quite a perfect cleavage plane, often characterized by crystallization. When a "settling pot" has become filled with matte a fresh one is substituted. The matte is allowed to cool and then broken up, as before described, and is ready for further manipulation. The advantage of the Devereux pot over the ordinary slag-pot, is connected with the possibility that a small quantity of matte may overflow with the slag from the settling pot. In the use of the ordinary slag-pot everything except the crust adhering to the sides of the pot and a small amount of the top crust would be thrown away over the dump; whereas, with the Devereux, if any matte is present, it is saved in the "button" below the hole. If, upon cooling, this "button" is seen to carry no matte, it is either thrown away, involving little additional expense (which is justified by the safeguard thus secured against loss), or it is re-smelted with the "crusts."

*The Omaha and Grant Smelting Company.*—At the works of this company, in Denver, Colorado, a very good system for handling slag and matte has been introduced. Slag is received from ten blast furnaces. The molten material is tapped from the furnace into a slag-pot, which is wheeled away, and the slag is emptied as quickly as possible by tilting into a large pot constructed on the Devereux principle, which has previously been lowered into a cylindrical compartment or pit in the dump, so that the top of the pot when in position, shall be on a level with the dump at this point. Those pits with their large pots, of which there are several, are located in a row about 120 feet in front of the blast furnaces. When one of these large pots is full of slag and matte, it is hoisted and carried by an overhead crane to such a position that when the plug of clay is punched out the slag will run into side-dumping slag-pots on trucks, after which the large pot is conveyed to another position, so that the matte left in it may be tapped into a pot of the same construction, but somewhat larger than the ordinary slag-pot. The shell in this large pot, after the slag and matte have been tapped, is conveyed to a convenient spot, and the "crusts" are dumped.

When the side-dumping slag-pots have been filled, they are pulled by mules to the edge of the dump, and the slag is thrown over. The matte is allowed to cool in the pot into which it was tapped, and is then broken with culling hammers. Any slag on the dump, in the form of crusts or otherwise, which is to be re-smelted, is loaded into a small car lowered on a tramway, so that its top is below the level of the dump, and hoisted in this tramway several feet above the charge floor, upon which the car is wheeled to the furnace at which it is desired to dump the slag. * * * *

*The American Smelting Works.*—At these works, in Leadville, Col., a branch plant of the Aurora Smelting and Refining Company, the slag from seven lead furnaces is granulated, as is likewise most of the matte made. The molten material is tapped from the furnace into a settling-pot. A portion of the matte settles in this pot, and that which does not, overflows with the slag into a second, somewhat smaller, settling-pot. From this the slag overflows into a jet of water, under 20 pounds pressure, in which it is granulated and sluiced away. When the second settling-pot is full of matte, it is replaced with an empty one and hoisted to a suitable point, and the matte is granulated, the granular particles falling into storage bins, from the bottom of which the stock is drawn out, when desired, into tram-cars and conveyed to the roasters.

*The Consolidated Kansas City Smelting and Refining Co.*—The main works of this company are at Argentine, Kansas. Here slag is handled in somewhat the same way as at the works in Leadville, with the exception that the Argentine slag, instead of being thrown away, is sold to the railroads as ballast. The molten material is run from the furnace into Devereux pots, which are wheeled to a cut somewhat similar to that described at the Arkansas Valley Works. Into this cut are run slag-trucks, which, however, carry, instead of conical pots, rectangular cast-iron boxes. When a train of these boxes is ready for the slag to be tapped into them, a wrought iron pronged eye-bolt, 1¼ inches in diameter, is placed in the middle of each box, the eye extending about four inches above the top of the box. When all the boxes on the trucks have been filled with slag, a small motor side-tracks the train and puts another train of empty boxes in the cut. After the slag in the boxes has cooled sufficiently, a small traveling crane picks up one cake of slag after another by means of a hook inserted into the eye of the pronged eye-bolt, and deposits the same in front of a crusher. The cakes are broken up with hammers, the eye-bolts are withdrawn and the slag goes through the crusher, and is loaded on railroad cars, ready for use as ballast.

*The Omaha and Grant Smelting Company.*—At the works of this company in Omaha another adaptation of the Devereux system is in use. The molten material is tapped into the Devereux pots from the blast-furnaces and allowed to stand long enough for as complete a separation of slag and matte as possible. About 75 feet in front of the furnace building, and centrally located, is a contrivance which handles very ingeniously the slag as tapped from the Devereux pots. It consists of a circular pit, about 35 feet in diameter, and filled with water, upon the outer zone of the surface of which an annular disk of cast iron plates, about 2 feet wide and 1¼ inches thick, and slightly trough-shaped on the top, is made to revolve. This disk is supported partly by radial arms from a pillar in the center of the pit and partly by rollers attached to the plates underneath, and traveling or stationary plates, which are in turn supported by pillars around the circumference of the pit. Revolution is effected by means of a rack on the periphery of the disk. A constant stream of cold water is run into the pit and an outlet is provided for the heated water, the supply being so regulated that the water shall not overflow the trough-shaped surface of the disk, but the lower side of the plates, with the rest of the mechanism, shall be constantly immersed in cold water. The apparatus makes one revolution in five minutes.

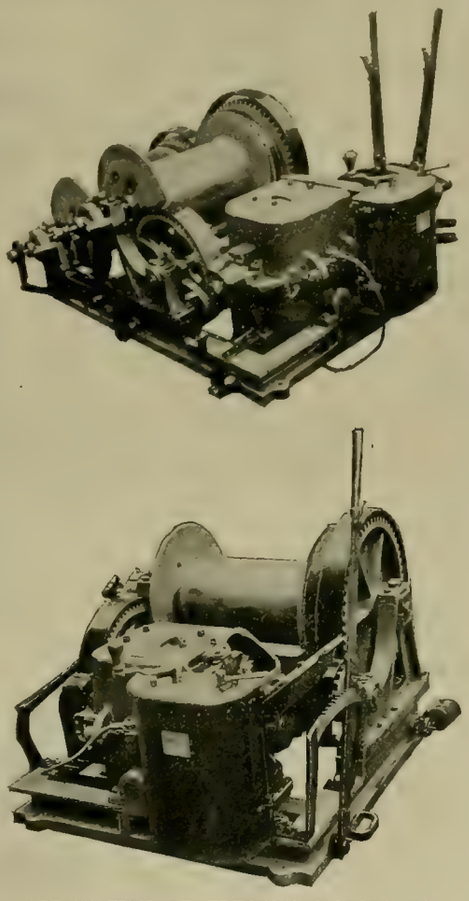
A Devereux slag-pot having been wheeled to the edge of the pit, the slag is tapped, first striking a cast iron plate fixed at an angle of about 60 degrees from the horizontal, to prevent the undue scattering of the slag, which passes through upon the revolving trough-shaped disk. On this it spreads out, covering the plates to the depth of ¼ to 1 inch, according to the amount of slag being made. From the molten state in which it was tapped from the pot, the slag cools gradually on those water-cooled plates, until at the end of a revolution it is quite brittle. A piece of ½-inch steel is set diagonally across the revolving plates in such a manner as to break up the slag and force it on to a conveyor, which takes it up into bins, from which it is loaded on railroad cars. It is of such size and structure as to be of superior quality for the purpose of ballast, being square or rectangular in shape, from ¼ to 1 inch in thickness and from ½ inch to 4 inches in surface area. This arrangement was designed by Mr. Page, the superintendent at these works.

*The Hanauer Smelting Works.*—At these works, near Salt Lake City, Utah, silver-lead ores are concentrated in blast furnaces. A sluice carrying water under pressure is run under the floor in front of the furnaces. The slag and matte are tapped periodically from the furnace into settling-pots; the slag overflowing into the sluice is granulated by the stream of water and carried to a pit or "boot," whence it is hoisted by a belt-elevator into bins, from which it is loaded on railroad cars to be used for ballast. The matte and the small amount of adhering slag in the settling pots are culled and handled in the usual manner.

*Slag Tiles.*—As a matter of particular interest, I will briefly describe, in conclusion, a successful manufacture of slag tile from blast-furnace slag, invented by Mr. Marco Cheapponi, E.M., which I saw in operation at the smelting works of Senor Concha i Toro, about 15 kilometers from Santiago de Chili.

The slag and matte are tapped from the blast-furnace into a slag-pot, and, after settling a few moments, the slag is poured from ladles into moulds (6 by 1 inch each); these are placed on a hearth which has a movable cover; the moulds being filled with slag, a cover is placed on them, as well as on the hearth. A very light heat is kept up, so that the slag is very slowly cooled; and when it appears black the moulds are lifted from the hearth and the slag-tiles are dumped into cold water. The slag-tiles thus made are light and portable, and, when laid, tough and durable. A slag carrying a considerable excess of iron has been preferred. These tiles are sold for from $30 to $60 (pesos Chilenos) per 100.

It is generally known that it is impossible under ordinary circumstances to make tiles of such dimensions as are mentioned above without some extraneous means for toughening.



Though, at other establishments than those spoken of, I have observed somewhat altered details in the systems of slag and matte manipulations, I believe this paper covers essentially my purpose, which was to describe the main features of our Western practice.

*Read at the Pittsburg meeting of the American Institute of Mining Engineers, February, 1896.

# Electrical Progress.

### Portable Electric Hoists.

The application of the electric motor to portable hoists for derricks is herewith illustrated in engravings of two hoists which the General Electric Company has lately furnished the United States Government, in connection with an important electrical installation. These hoists are of the double drum and single drum type, respectively, the double drum hoists being operated by a 20 H. P. motor, the single drum hoist by one of 10 H. P. Each motor is mounted upon the same bed plate as the hoist and is of a late and efficient type, resembling in general appearance the well known G. E. 800, so extensively employed in railway service. The parts of the motors are all readily accessible for examination and repair, but are entirely covered in by the motor casing and are thus fully protected against dust, moisture and mechanical injury. The armatures are iron clad, each coil lying in a slot in the iron core entirely below the outside surface. The motors are sparkless and the bearings are self oiling. The controllers are known as M. R. and embody all the excellent features of the controller K2 used in street car work. The levers for the brakes, controllers, etc., are so arranged that full control of the entire mechanism is had without change of position by the man in charge. The hoists themselves are from the works of the Lidgerwood Company. The drums are 14 inches in diameter and 26 inches long.

APPLICATION OF ELECTRIC MOTORS TO DERRICKS FOR HOISTS.

THE Salt Lake & Ogden Railway Company has incorporated with a capital of $800,000, divided in 8000 shares of the par value of $100 each. Ten per cent of capital stock is subscribed for by C. K. Bannister, E. M. Allison of Ogden, E. W. Duncan, J. S. Critchlow and C. Browne, Jr., of Salt Lake, to build and operate forty miles of railroad between Salt Lake City and Ogden. The Pioneer Power Company of Ogden is at the head of the enterprise, Mr. Bannister, its chief engineer, being one of the prime movers in the matter. That company, which is erecting a big power plant in Ogden canyon, wants to transmit that power to Ogden and Salt Lake by electricity. To do that requires wiring the whole distance, and as long as the wires have to be strung, the laying of a track and the operation of an electric road would be a comparatively easy matter. The Salt Lake & Ogden Railway Company will commence operations by building an electric road from the power company's power station, four miles away, to Ogden.

IF the recent discovery that all substances through which the Roentgen rays are passing become, for the time, conductors of electricity implies that the conductivity of an electrolyte can be improved by the transmission through it of Roentgen radiation, there are many new processes in electrochemistry which may become practicable—for instance, the deposition of crystalline carbon. The internal resistance of galvanic cells and storage batteries may also be diminished, with consequences of great magnitude as regards the generation of electric current by these means.

THE Telluride Power Transmission Company, supplying Telluride, Col., and mines as far distant as fourteen miles, will adopt the two-phase system. The change necessitates an expenditure of over $150,000 for the machinery alone. The new plant will be set up at Ames, ten miles from Telluride. Eight miles from the power works, in a direct line from the town of Ames, the power transmission company has tapped the San Miguel river, turning the water into a flume.

AN economic method of treating low-grade and refractory ores is being successfully applied at Broken Hill, New South Wales. The method is really zinc base smelting. By this process the zinc is saved, and all of the minerals contained in the ore are made available for market. The smelters now charge 50 cents a unit for zinc in excess of 10 per cent. For instance, 20 per cent zinc ore shipped from this section during the past year has added $5 a ton to the smelting charges. The difference between a zinc penalty or none at all means many dollars profit to a number of the shipping mines and renders available many ores which cannot be marketed now. The zinc is extracted by the electrolytic process, which leaves the sulphide ores, which were in combination in the form of an oxide, making a very desirable product for a smelter.

AT Mt. Lowe, southern California, there are now three independent generating stations, each auxilliary to both the others. At Altadena is a 180-horse power dynamo, operated by two 60-horse power gasoline engines. At Rubio is an 80-horse power dynamo, and at the new power-house on Echo mountain is a 150-horse power multipolar dynamo, actuated by a 100-horse power gas engine, fed by gas piped for a distance of eight miles. This engine, with two cylinders and a sixteen-inch driving belt, is said to be the largest engine of the kind on the Pacific coast. In addition is an 80-horse power motor at the top of the incline, exclusively to operate the cable.

THE Market Street Railway Company of this city, which has authority to issue bonds to the amount of $17,000,000, sold another half-million block last week to the Hellman syndicate. It now proposes to change the Post and Howard cable lines in this city to electric lines and make further extended connection therewith in the western part of the city.

LAST WEEK were incorporated the Security Electrical Inspection Company; capital stock, $100,000, $1000 subscribed; A. Bowie, O. Blain, J. Napthaly, A. Bouvier, S. N. Napthaly, T. J. Craig, D. Friedenrich of San Francisco, directors, and the Sterling Electrical Supply Company; capital stock, $100,000, $10,000 subscribed; J. R. Cole, A. H. Pennoyer, F. G. Cartright, F. W. Gale of San Francisco and F. N. Delaney of Alameda, directors.

A GOOD IDEA may be gathered of the extent to which transmission of power by electricity is gaining ground in this country by the statement that, in the long-distance plants installed by the General Electric Company during 1895, over 1200 miles of copper wire for transmission purposes alone were used, amounting practically to 1,200,000 pounds of copper.

THE new electric line between Los Angeles and Santa Monica will be completed April 10th.

# Scientific Progress.

### The Monazite Industry.

From an American standpoint, one of the most interesting results of the controversy over the validity of the German patents covering what is known as the Auer von Welsbach incandescent burner, is its influence upon the current demand for monazite—the mineral from which thoria is principally derived and which, as is generally known, is found in a district comprising several adjoining counties in North and South Carolina. According to Professor Nitze, assistant State Geologist of North Carolina, the product of monazite sand in the Carolinas was 65 tons in 1893, 300 tons in 1894, and about 600 tons in 1895, and as such sand, containing from 60 to 75 per cent of monazite, is worth in Germany from $120 to $130 per ton, the subject is one of definite commercial importance. Thus far the European market has been largely dominated by the supply of monazite sand from Brazil, where it is found in the form of a fine-washed seashore sand, containing usually only from 2 to 3 per cent of thoria, whereas the Carolina monazite abounds in crystals of all sizes up to that of a grain of wheat, and contains generally from 3 to 6 per cent of thoria. But for the reason that the Brazilian sand is uniformly fine, free from particles of titaniferous iron, and can be put directly into the extracting process without being artificially pulverized, it is preferred by the great Auer-Welsbach companies in Vienna and Berlin. The North American monazite, on the other hand, must first be ground to a fine powder, which, in consequence of the hardness of the crystals, is a somewhat tedious process, unless the best machinery is employed. A ton of Brazilian monazite sand, costing at present in Hamburg $119, yields, when well worked out, from 20 to 25 kilograms of pure thoria, which is worth from $2400 to $3000, according to the degree of purity.

The one ultimate and effective plan of organizing the monazite industry in this country will be to establish at a convenient point in the mining district a laboratory, where, by employing the most approved and economical methods, the monazite may be worked up, the thoria extracted and made available as a finished product in all countries where incandescent gas burners are manufactured.

Thorium oxide is now worth in Germany from $120 to $150 per kilogram (2.2 pounds av.), according to purity, and the demand is, thus far, greater than the supply. Most manufacturers of incandescent gas burners would prefer to buy their supply of thoria ready for use than to conduct a separate laboratory for extracting and preparing it.

The one pertinent question, from an economical standpoint, would be whether the chemicals which are used in extracting thoria can be transported from New York or Baltimore to the Carolina monazite district more cheaply than the crude sand can be brought from there to Europe, where from 96 to 98 per cent of its bulk becomes at the first operation absolute waste material. The chemicals required for this process are neither rare nor costly, and with a well-chosen site, at which water power may be utilized for pulverizing the raw material, the success of such an enterprise would in the opinion of competent authorities be practically assured.

THE theory that electricity, magnetism and chemical action are modes of motion, either of the molecule or the ether, is held by Walker, an English physicist. He claims that this view, which he published three years ago, is confirmed by the Roentgen experiments. An electric current, according to this author, is a series of waves of of greater length than the largest of the invisible heat waves, and of a transmission rate lower than those waves, electric magnetism, a series of waves shorter than the ultra-violet waves, and with a higher rate of transmission; magnetism, a wave motion imparted to the molecules of iron at their formation or to the ether surrounding the molecules; chemical action, a motion probably between the wave length of the highest sound wave and the waves of electricity. Roentgen rays, he believes, may be very short electromagnetic waves.

THE cold-drawn process is now largely resorted to in the production of steel tubing and is a great factor in the construction of the bicycle, and involves machinery both ponderous and powerful. One of the methods employed consists in taking a piece of steel in the shape of a bar or ingot. This is bored through the center and it is then passed through a die, after which it is heated and treated to a bath in a secret preparation, which removes the temper which the drawing process imparts. This is repeated a number of times, each die used being smaller than its predcessor, with the result that the tube grows smaller and longer. This is continued until the tube is of the right diameter and gauge. The drawing out of a piece of steel in this manner, without beating it, is regarded as a notable example of the perfection of modern machinery

HOW IT is possible to measure wind by its sound has been told by Prof. Carl Barus to the National Academy of Sciences. The whistling of the wind as it crosses a wire varies with the velocity, and this can be computed from the pitch of the note observed in case of a given diameter of wire and for a given air temperature. A special micrometer attachment can be made to convey the sound, isolated from other noises, to the observer at a distance. Every gust and variation of the wind can be studied in this way, and an idea of the direction of the gust can be had from the sounds obtained from three wires placed at right angles to one another. Micro-aulmometry is the name proposed for observations by this method.

OZONE is becoming an important industrial agent. It artificially ages liquors, removes the effect of oily beans in coffee, and improves tobacco. In its late application to the rapid seasoning of wood for sounding boards and musical instruments, it increases the resistance of the wood to temperature and moisture, and adds to its acoustic qualities. It thickens linseed oil for linoleum in a few days, whereas the old method of oxidation often took several months. It bleaches linen in less than a third of the time required by sunlight. It is also valuable in chemical and technical processes, especially in purifying starch derivatives from undesirable color, odor and taste.

# Mechanical Progress.

### Chemistry of Steam Raising.

The life of the boiler depends on several factors, of which the character of water, considered, is one of the chief. Hard calcarceous waters form scale, and in this respect are injurious to the economy of steam raising, partly by damaging the boiler itself, and partly by wasting the fuel required. The latter is a serious evil, for the incrustation is a badly conducting material, and, by impeding the transmission of heat from the furnace to the water, diminishes the output of steam from the boiler, if the furnace is fired normally —that is, at a rate approximate to the absorption of heat by the "heating surface" exposed by the boiler. To compensate for this diminished output of steam the natural action of the stoker (often necessary when the full output of the boiler is required) is to increase the rate of firing, with the sesult that the extra quantity of heat generated in the furnace is only imperfectly absorbed by the boiler, and goes to waste in the flue gases. It has been found that an incrustation of one-sixth of an inch thick causes the use of about sixteen per cent more fuel than would be necessary with clean plates whilst one which is one-fourth of an inch thick involves a waste of as much as fifty per cent, and one of one-half of an inch a waste of 150 per cent. The damage to the boiler itself is due to two causes —(1) the deterioration of the plates by overheating, and (2) the mechanical damage involved in removing the incrustation. A coated boiler plate is necessarily hotter than when clean, as the water is kept from free contact with it. Thus, whereas, a clean iron vessel containing water boiling under atmospheric pressure has a temperature not more than 10° C. above the boiling point of water, one with an incrustation so thin as one-sixteenth of an inch may have a temperature more than 100° C. higher. The mechanical properties of the metal composing the boiler plates are considerably modified even by the temperatures proper to modern pressures—*e. g.*, 150 to 200 lbs. of steam, corresponding with 370° to 400° F.=188° to 204° C.—and are still more affected when there is extra heating on account of the presence of an incrustation.

In the case of boilers of the water tube or of the locomotive class, a further difficulty arises from the incrustation—namely, the blocking of the tubes or of the spaces between them with scale, and consequent hindrance of circulation of the water. In aggravated instances actual stoppage of a water tube may occur, involving its speedy destruction by its exposure to the fire without being simultaneously cooled by contact with the water.

The evils of heavy incrustation are sufficiently well recognized to lead to the practice of periodically chipping the scale from the boiler plates, a troublesome operation, liable to cause injury to the boiler, and best avoided by removing the cause of incrustation. Although a water yielding a heavy or even a moderate scale is thoroughly objectionable, one giving a slight film of calcium carbonate or sulphate is not wholly harmful, on account of the protection which it affords against corrosion from the several sources to be mentioned.

### Fine Road in Fresno County.

Fresno county is trying the experiment of building a line of road upon scientific principles. It is to be eight miles in length, extending due east from Fresno, and passes the County Hospital, the fair grounds, the Fresno, Eisen, St. George, Butler, Oothout and other large vineyards. There has been a road along that line for a quarter of a century, but that old road is now undergoing a great transformation. It was plowed up, the high places scraped, low places filled, and portions liable to become muddy in winter filled in with sand. The road is as straight as an arrow and as level as a floor. After being graded to the proper form, it is hardened by a 20,000-pound roller. A small ditch is made along the road and filled with water from neighboring canals. A sprinkling machine, made especially for the purpose, lifts the water from the ditch and throws it in a shower over the road. One team can sprinkle from twenty to twenty-five miles of road a day by this process. The machine is placed on a wagon and is driven as fast as the team can walk. The road will be kept damp during the summer. A broad-tire ordinance is under consideration by the Board of Supervisors. A path for bicycles has been constructed along the side of the road.

### Endless Belt Conveyors.

It is customary in some ore mills, especially those employing magnets for the separation of iron from rock, to use endless belts for the transportation of pulverized material from one spot to another in a horizontal or nearly horizontal direction. Such belts are often twenty or thirty inches wide, and some of them are long enough to pass over rollers 500 apart. The latter are driven by machinery, and move the belt forward at a speed which now and then rises to 300 feet a minute. Between the end rollers, at proper intervals, are others, called idler pulleys, which merely sustain the belt and its load.

At first it was common to use a perfectly straight roller for this purpose, but of course there was danger that the ore or other material carried (like clay in a brickyard) would shake off the edges. Besides, it was necessary to regulate the feed carefully, in order that the load would be evenly distributed along the belt. After a time some sideboards, or skirtboards, were erected at the edge of the belt—not perpendicular, but slanting outward—to increase the capacity of the "conveyor," but these would wear the belt. When it became necessary to trim off the edges from this cause the boards would be set up closer. Another improvement was to enlarge the ends of the roller so that it looked like a gigantic spool, from which the thread had had been removed. The conical attachments unlifted the edges and enabled the conveyor to carry a bigger load than if flat. This substitute for the skirtboards worked fairly well with narrow belts, but not with wide ones. Those parts of the bevelled ends having the largest circumference would slip along the under side of the belt and wear it, since they were obliged to move more rapidly than than the straight middle section of the roller. Finally, one more important amendment was adopted. Three rollers were used—one in the middle being horizontal, and two at the side, the axes of the latter being turned up at an angle of 45 degrees. These side rollers took the place of skirtboards and spool ends, but were free from the faults which those other devices exhibited.

The belts used in these conveyors are of cotton duck, coated with rubber. The former material gives longitudinal strength, and the latter a wearing surface. Many experiments were made with different adulterants before a cheap and durable compound was finally secured. This, by-the-way, is applied to a greater thickness in the middle of the belt than at the edges, as this is where the most wear comes. These various improvements have greatly lengthened the life of a belt. Formerly one would last only three or four months. Now they render good service twice as many years. The amount of power required to operate such a conveyor is very slight, and the system is a great advance on wheelbarrows.

Each of the two turbines which drive 5,000 H. P. dynamos at Niagara is situated about 160 feet below the machine, and is connected therewith by a hollow steel shaft 31 inches in diameter. The whole weight of this mass of steel is supported, not by the bearings, but by the water when the wheel is in motion. The Power Company is considering the practicability of putting the next three or four dynamos down in the wheelpit, thus getting rid af the enormous shafts altogether.

Steel wagon roads, as advocated by Martin Dodge, State road commissioner of Ohio, are likely to have a thorough trial in several States this year. These roads consist of two rails made of steel the thickness of boiler plate, each formed in the shape of a gutter five inches wide, with a square perpendicular shoulder half an inch high, then an angle of one inch outward slightly raised. The gutter forms the conduit for the water, and makes it easy for the wheels to enter or leave the track. Such a double-track steel railroad, 16 feet wide filled in between with broken stone, macadam size, would cost about $6,000, as against $7,000 per mile for a macadam roadbed of the same width, but the cost of a rural one-track-steel road would be only about $2,000 a mile. It is claimed that such a road would last much longer than stone, and that one horse will draw on a steel track twenty times as much as on a dirt road, and five times as much as on macadam.

Mechanical skill of no ordinary character is required to produce the hollow steel boom, the spar which has now become so noted in marine architecture, advantage being gained, in exigencies, by beginning in the center and riveting the plates toward both ends. In the most recent instance of this construction there were four lines of angle iron braces at equal distances from each other and running the whole length of the boom, giving it a good bracing, the face to the angles being slightly curved to take the concave shape of the interior of the boom, these angles consisting of sections measuring on an average some 15 feet, with a lap made at each joint several inches in length and bolted with steel. These laps are irregular, in order that two joints or more may not be opposite each other and thus eause weakness.

Great Reduction in Light!

IMPERIAL Automatic Gas Machine

Produces a Beautiful Light.

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

# Practical Information.

### Water Tube Boilers for Warships.

The old style of marine boiler has fire passing through its tubes, and the latter are encircled by water contained in an enormous shell. But in what are called "water-tube" boilers, the water is inside the tubes and the fire outside. The great advantages of the new type are ability to get up steam quickly, economy of space, saving of weight, higher pressure and safety. But while agreeing upon the suitability of water-tube boilers for small craft, like torpedo boats or torpedo-boat destroyers, naval experts differ as to the wisdom of putting such steam generators into big warships. England has gone further in this line of experiment than any other country, but Holland is following her example. Just now the latter power is arranging to equip three good-sized cruisers almost entirely with water-tube boilers of the Yarrow pattern. The total horse power to be provided for each vessel is 9250, which is only a little less than that of the American line steamships. But our Dutch friends are cautious. They propose to have Scotch boilers enough to develop about 2250-horse power on each of the cruisers, and water-tube boilers enough to give 7000-horse power. This plan will guard against failure through the inexperience of the stokers, and enable the latter to become familiarized gradually with new apparatus and new methods. Moreover, if the venture should prove unsatisfactory, the pecuniary loss will be less than if water-tube boilers exclusively were employed. As showing one of the merits of the new system, it may be remarked that the Scotch boilers, while developing less than one-third of the steam obtained from the others, weigh (with water) 120 tons, and their rivals only 88 tons. The manufacturers are testing the new boilers for a pressure of 350 pounds, although 200 is the highest that will be employed in service. Messrs. Yarrow will not make the whole twenty-four required, however, but only three samples, one for each ship. Dutch boiler makers will build the others.

In the earlier attempts to produce an incandescent electric light, forty and fifty years ago, the slender filament was made of platinum. Edison, Swan and others subsequently found that carbon had several advantages over that substance. Its resistance is greater. Less energy is required to raise its temperature. And it is practically impossible to melt it, however great the heat. Curiously enough, though, some attempts have recently been made to substitute metals for carbon, but the man (or at least one man) who is trying these experiments employs niobium, tantalum, molybdenum, titanium and zirconium, instead of platinum. These are all known to be exceedingly refractory materials—that is, they are hard to melt. The object sought is greater durability than is possessed by the carbon filament; but the wonderful brilliancy of the gas-heated Welsbach burners, in which other rare and refractory metals are used (lanthanum, thorium and praseodymium), suggests the possibility that a brighter light may also be secured in this manner. J. W. Aylsworth of Newark, N. J., who is among the experimenters, uses a carbon thread for a foundation and coats it with metal.

Horseless mail wagons will soon be used in all of the large cities of the United States. Second Assistant Postmaster General Neilson has for several months been studying the project and a few days ago completed the plans for the model carriage. It is now in course of construction and will be completed very soon. The dimensions of this new wagon will be 12 feet long, 6 feet wide and a trifle over 6 feet high. It will be fitted up precisely as in a mail street car or a steam railroad postal car, except that the scale will be smaller. The body of the wagon will be hung on springs and counter springs and the wheels shielded with heavy rubber tires. It has now been definitely settled by the Postoffice Department to employ the horseless wagons in the transportation of mails in the city and country districts where there are no railway lines and where the service can be improved by making "separations," assorting the mail between office, while in transit. It is intended to place these wagons in service in cities which cover a large area and where "separation" between four or five stations will greatly facilitate mail delivery.

At one time the entire Pacific Northwest was practically a county of Iowa. In 1843 the provisional government of Oregon adopted the statutes of Iowa that had been passed by the Territory in 1839, and at a subsequent session of the Oregon Legislature the revised statutes of Iowa were made the law of Oregon—which at that time extended north to the British boundary and east to the summit of the Rocky mountains.

### Commercial Paragraphs.

Fraser & Chalmers are erecting a 20-stamp combination mill on the property of the Florida Mining Company, at Silver City, Ida.

W. S. McDonough of the Colorado Iron Works of Denver is putting in machinery for the Smith-Yanlot Co. at Bald mountain, Wyoming.

The Dow Steam Pump Co., this week sent a triplex power pump to Los Angeles, four boiler feed pumps and two sinking pumps to Central America and two pumps to Arizona, the latter with sufficient capacity to force water through ten miles of 4-inch pipe to an elevation of 500 feet.

Following is a synopsis of the contract between the General Electric and the Westinghouse companies, which may not be perfected for a month: The General Electric Company contributed 62½ per cent and the Westinghouse Company 37½ per cent in value of the combined patents, and each company may use the others' patents on royalty. A board of control, consisting of two representatives of each company and a fifth to be selected by these four, will manage the patents.

### Obituary.

Gen. T. L. Casey, late chief of engineers, U. S. A., died in Washington, D. C., on the 25th, aged 63. As a member of the Government engineer corps he spent some time on the northwest Pacific coast, and in late years had charge of the most important Government work, being placed at the head of the department in '88. His skill as an engineer was equaled by his integrity as a man, a combination common to the general character of engineers. During his incumbency over $500,000,000 passed through his hands, not the shadow of suspicion attached to the disbursement of a dollar of it. His chief claim to fame as an engineer rests on the successful completion of the Washington monument.

### Death of Nat W. Pratt.

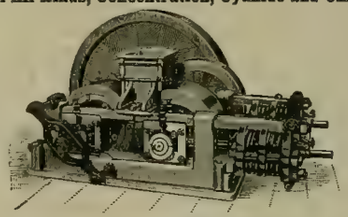
Nat W. Pratt, President Babcock & Wilcox Co., New York city, died at Brooklyn, N. Y., on the 10th instant, aged 44. Born in Baltimore in 1852; old American stock; families on both father's and mother's side settled in Plymouth county, Mass., in 1830; inherited mechanical tastes; father, William Pratt, was, during the war, superintendent of the Burnside Armories in Providence, R. I. Young Pratt entered the employ of the firm of Babcock & Wilcox in 1870. His energy, engineering ability and remarkable business qualifications won the confidence of his employers. In 1821 the Babcock & Wilcox Company was organized as a corporation. He became treasurer and manager of the new company, retaining the position until at the death of George N. Babcock, in 1893, when he was elected President. Illustrating his versatility: In 1894 he became consulting engineer to the Dynamite Gun Company. Under his designs and patents the first successful dynamite gun was built. It was with this gun, 8-inch caliber and 60 feet long, that the experiments in throwing aeriel torpedoes were conducted at Fort Lafayette, N. Y. He was a member of the American Society of Mechanical Engineers, American Institute of Mining Engineers, American Naval Institute, also a member of the Engineers' Club in New York city.

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

METALS PERFORATED AS REQUIRED FOR

MINING SCREENS OF ALL KINDS

AND FOR USE IN



Milling and Mining Machinery
Reduction and Concentrating Works

GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of bonding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

HYDRAULIC MINING

By the HYDRAULIC GRAVEL ELEVATOR SYSTEM a Specialty.

# Mining Summary.

## CALIFORNIA.

### Amador.

The *Record* learns that Supt. Tregloan will begin sinking in the South Spring Hill shaft immediately. The 40-stamp mill will be thoroughly overhauled and it is expected that the entire stamps can be set in motion before long. A portion of the stamps have been running for several months past on ore from the Median shaft.

*Record:* The Garibaldi mine, near Hawkeye, has been bonded to a New York mining company, which will send an expert out to report on the prospect. A 50-foot shaft has been sunk.

### Butte.

A number of men are working in the mines at Bangor and it is said more will find employment after April 1st, when work will be resumed in the Catskill claim. The North Bloomfield Co. is at work at the Osgood mine, putting in steam power.

### Calaveras.

At Murphys the new owners of the Carley or Falcon mine have started sinking the shaft.

The new stamp mill of the Shaw Bros. has started up on quartz from the old dumps on their mine.

### El Dorado.

(Special Correspondence).—Superintendent Parlow has completed the 3000 feet of five-inch pipe line from the Gentle Annie mine to the tunnel that is to be run by compressed air power drills.

Wm. H. Reinbold is sinking a shaft on the Pennsylvania claim, near Garden Valley. He has attained a depth of fifty feet on a four-foot ledge which prospects $5 to the ton in free gold.

G. E. Thorsen of Garden Valley is developing a twelve-foot ledge of $3 rock on the Valley mine. This is free milling. Garden Valley is ten miles northeast of Placerville.

F. M. Bell has sunk to 106 feet in depth on the Emma mine, the second extension of the famous Rosecrans property.

Portland, Oregon, people have bonded from C. J. Heald, near Nashville, thirteen miles southwest of here, the Adams Gulch property, and are sinking a shaft and running a tunnel.

J. Morgan Taylor has bonded 100 acres of gravel property near Indian Diggings, twenty-five miles southeast of here. A New York party is associated with him. They have already begun preparations to operate on a large scale, and will soon apply for a permit to hydraulic. Mr. Taylor is the originator of the water hoisting machinery, which he has been operating largely in Oregon.

Placerville, Cal., March 25, '96.

A Placerville dispatch says six miles south of there D. H. Jackson, who recently bought ground from S. Salisbury, developed it, placed machinery and mills on it and named the mine the Salisbury has sold it to Monroe Salisbury who will sink a 500-foot shaft, erect a hoist, add milling machinery and lay a pipe line.

### Mariposa.

*Gazette*: At the Sierra Buttes Company's Tendron mine, six miles from Mariposa, the 20-stamp mill is running.

At the Tyro mine the last assay made from the 700-foot level yielded over $500 per ton. The company is pushing sinking another 100 feet below the 700-foot level.

The Triumph Development Company, headquarters in Fresno; capital stock is $250,000; general manager is F. A. Alexander; has bonded five claims on Bear creek.

The old Bear Creek mine, seven miles northeast of Mariposa, is about to be reopened by Rippe Bros. The mine has a shaft sunk upon the vein, and is down about 200 feet.

Ludwig's mill is being taken to the Laura LaGrande, Coulterville district, near Hazel Green. It is probable that a 20-stamp battery will take its place at Mt. Ophir.

About the 25th of this month the Yellowstone mine at Bear valley will open up again. A new hoisting plant is to be put in, and it is probable that the number of stamps will be increased from five to ten. The shaft is now down 480 feet, and the owners, who are an incorporated company in San Francisco, are figuring on going down to 1000. As regards the mine itself at the present time, the indications are entirely favorable.

The Alice Clark mine, one and one-half miles from Coulterville, is owned by H. H. Clark of Horseshoe Bend and Mr. MacLymont of the firm of Saville, MacLymont & Co. of San Francisco, mining assayers and metallurgists.

### Napa.

QUICKSILVER COMPANY'S REPORTS.—At the recent annual meeting of the Napa Consolidated Quicksilver M. Co., at Boston, Mass., General Manager Buckminister, vice-president of the corporation reported: "Although the past year has been one of unusual depression, we are happy to say that the operations of the company have been fairly remunerative, and we enter upon the coming year in good condition. The work of prospecting and development has been carried on vigorously and good results obtained, showing a number of strong ore bodies and putting the property in a better physical condition than ever. The different stopes are opened out, showing ore in sight for a long period. We have duplicated the reduction plant by the erection of the new furnace and works, and are ready to largely increase our output should it be deemed advisable. We have yet a large acreage of mining claims unprospected, upon which work will continue to be done as in the past, thus keeping far ahead of the requirements of the furnaces. The company owns a large amount of timber land, and its policy will be to continue to purchase more from time to time as opportunity offers. It has to-day a complete and modern plant. No construction account is maintained."

For '95 the annual report shows: Sales quicksilver, $118,862; on hand, since sold, $69,-125; total expenses, duplicate furnace and reduction plant, $112,205; net earnings, $75,721; dividends, $80,000; profit and loss January 1st, 1895, $44,671; profit and loss January 1st, 1896, $40,243; construction and repairs charged to expense, $19,274; depreciation buildings, $5,-629. The assets of the company are: Cash, $1,036; plant, $700,000; quicksilver, $69,125; supplies, $10,111. The liabilities are: Capital stock, $700,000; unpaid drafts, $4,493; Haas Bros., $34,280; unpaid dividends, $505; unpaid bills, $750; profit and loss, $40,243; total, $780,-272. During the year 17,650 tons of ore were smelted, producing 5,400 flasks or 413,100 lbs. of quicksilver. The company owns at Oat Hill 1,560 acres of land and 340 acres of mining claims, also works valued at $72,170.

The same people compose the Ætna Consolidated Q. M. Co., which owns at Lidell 350 acres of land and 573 acres of mining claims, and works valued at $37,470. General Manager Buckminister says: "In view of the depression in business during 1895 the results accomplished have been very satisfactory, and we commence the year in better shape and with brighter prospects. The dead work on the long tunnel, No. 9, which was run about 4,000 feet to catch the ore chute coming down from No. 7 level, has been completed, and a raise carried through to No. 7 level, and drifts run at No. 3 and No. 9 levels, showing a good ore body extending from No. 7 level to No. 9. Other and extensive prospecting work has been carried on and will be continued, with fair prospects. Furnaces No. 1 and No. 2 are working well and giving good per cent returns, but it is the intention to replace them at an early day, out of the earnings, with a complete modern plant. But a small part of the claims have as yet been prospected. The stopes in the new ore body were not opened until after the close of the year, so the results will show in next year's work."

For '95 the report shows: Sales quicksilver, $72,891; on hand, since sold, $42,350; total expenses, $83,631; net profits, $31,609; dividends, $29,000; balance, profit and loss, $11,609; profit and loss January 1st, 1896, $43,235; repairs to works, $4,766; depreciation, $4,553. The assets of the company are: Cash, $22; plant, $501,712; quicksilver, $42,350; supplies, $7,005; a total of $551,090. The liabilities are: Capital stock, $500,000; Haas Bros., $5,566; unpaid drafts, $3,288; profit and loss, $43,235. The result of the operation shows tons smelted, 16,-490; flasks produced, 3,300; pounds produced, 252,450; drifts and tunnels run, 4,138 feet; winzes sunk, 383 feet.

### Nevada.

The Lone Ridge mine at Blue Tent will be opened by an English company represented by Prof. George Treadwell. In former years ore was taken out that yielded $17 to the ton.

The North Star Mining Company has bought, through J. D. Hague, the Shanghai, White Ledge, Great Britain, Twilight and Tribute claims, on Massachusetts hill, south of Grass Valley, the company thus securing possession of nearly all of Massachusetts hill.

*Transcript:* In the Brunswick mine a body of fine ore is reported by Supt. Nihell; the ledge is eighteen inches and will mill from $25 to $40 a ton.

*Union:* A cleanup of fifteen loads of ore from the Illinois claim, a part of the Menlo Mining Company's property, which has just been made, netted $1,596.50, exclusive of sulphurets. The ore came from the 400 level.

### Placer.

In the Herman mine the distance from the surface to the tunnel is 280 feet.

The *Sentinel* says J. K. Carpenter has a contract for running about 2000 feet of the lower tunnel at Pioneer mine beginning April 1.

GONE TO CARIBOO.—Nearly fifty miners, en route for the Horsefly mine near Cariboo, B. C., passed through Colfax during the present week from Iowa Hill, Sunny South and Damascus. Some of the miners will travel by rail, but the majority of them will ship from San Francisco to Vancouver. From Vancouver they will go to Ashcroft, a distance of 200 miles by rail. The trip from Ashcroft to Horsefly, 175 miles is covered by stage. The party contains some of the best drift and hydraulic miners in California.

### Plumas.

*National Bulletin:* Most of the hydraulic and sluice mines about La Porte have made the most of the water season thus far, considerable work in that line having been done.

At Thistle shaft, from 110 to 120 men are employed, and work is progressing as usual.

The Pioneer mine at Grass Flat, Sierra county, has only a few men employed, and they are engaged in development work.

Ah Tye leased from the English company a part of the tailings in Slate creek for $9000, but other parties have taken possession of that portion of the creek bed and will not permit the lessee to work. Dr. Mussey, representing the English company, will, it is understood, begin legal proceedings.

### Riverside.

Riverside men have taken hold of the Hendsch mine and are developing it with excellent results.

### San Bernardino.

The McHaney (Desert Queen) mine, which has so far contributed considerable to the mining literature of southern California, is again distinguishing itself. Workmen are now reported to have struck "in a new shaft a big body of black iron ore heavily sprinkled with free gold." When "black iron ore" gets to showing "free gold," the locality becomes an interesting one.

A. F. Judson of Colton has just sold an interest in his group of four mines in the Virginia Dale district to Eastern men, and a ten-stamp mill will be erected at once and a pumping plant erected to bring water from a lake, three and one-half miles to the mill.

It is reported that the Ibex mill and mine will start up with a full force soon.

The rush to the Ibex district continues, and a number of the claims that have been prospected run well in gold. A townsite called Smyzerville has been laid off.

### San Diego.

AT JULIAN.—The Owens Company will sluice the tailings which have accumulated below the mill.

### Shasta.

Superintendent F. D. Fraser of the Siskiyou placer mine, on Clear creek, arrived in Yreka Thursday with six and one-half pounds of gold dust, valued at $1800, the result of a cleanup from nineteen days' run. The ditches on the property, of which there are sixteen miles altogether, are new and gave considerable trouble in the beginning, the banks settling and breaking away, but permanent repairs have been made and no further trouble is anticipated. There will be no doubt of a steady yield of $100 per day from this mine, the superintendent asserts, after everything is in ship shape. J. F. Morley has been engaged to make a report on the property for the New York stockholders.

A tramway from the Old Spanish mine, near Lower Springs, to a point on the railroad a few hundred yards south of the Middle Creek depot, will be built to convey ore from the mine to the railroad, where large ore bins will be erected, so that the ore can be run through chutes into the cars. The tramway will connect with that of the Eureka Tellurium gold mine at their upper works, about a mile above their mill, which is situated a short distance from the railroad. The Eureka Company will continue to use their tramway, and will also erect bins. It is expected that the ore from both of these mines will be reduced at the smelter of the Mountain Mines, Limited, at Keswick.

At Sunny Hill the Bell mine has been sold to a San Francisco mining company, which also owns and operates other mining property in Shasta county. Work will commence at once. Specifications, etc., are out calling for bids to put in a large 1000-foot tunnel, to be begun on April 1st and to continue at the rate of at least 100 feet a month till completed. The conditions will necessitate putting in power drills, with all accompanying appurtenances. This tunnel will cut the ledge at a depth of $600 feet from the surface, which is deeper by 400 feet than any ledge has been tapped in that district.

The *Free Press* says that at Harrison gulch there are forty locations, and all that have been prospected have turned out rich. Fowler and Rhodes own the extension to the Lucky Baldwin. From 100 tons on the dump 82 tons were worked and resulted in forty-nine pounds of amalgam. Nine pounds sent to Selby's netted $1500. They first sunk forty feet on the ledge, then drifted both ways, and have about 100 feet of tunnels.

*Searchlight:* The ledge of the Niagara at French Gulch, which was reported "pinched out" recently, has again been discovered, and the production of the mine, from present indications, bids fair to exceed any output of its past history.

At the Delta Lava Cap mine, owned by Deming, Preston & Co., work is progressing regularly. They are now running a crosscut tunnel to tap the lowest depression of bedrock, and are now in 140 feet. Where Dog creek cuts this channel a rich bar was deposited.

Negotiations are in progress for the sale of the Ellory, the Milkmaid and the Washington mines of French Gulch.

The A. C. D. G. M. Co. has finished its ditch and flume; the tunnel has been widened and track laid. The tunnel will be extended 50 feet farther in order to reach the deepest portion of the channel, but in the meantime gravel will be taken out of the drift from the upraise and sluiced. A few weeks more of dead work will expose this ancient lava-capped channel.

### Sierra.

*Record:* John Brandt has received an order for snowshoes for horses, from T. J. Field, of Juneau, Alaska. They are to serve as patterns for the Juneau blacksmiths. It seems that no one in Juneau understands the mechanism of the horseshoe. They got the idea of using them in crossing the Alaska snow fields from Mr. Morgan, who went to that country from this valley last fall.

*Enterprise:* The Buttes Saddle Co. has seventeen men employed under Superintendent Miller. The pay chimney is about 5 feet wide and is in contact with slate and porphyry. A second ledge has recently been struck which is about 15 feet wide and averages $8 per ton. The 10-stamp mill is run by water power under 300 feet pressure.

The Rising Sun and Early Dawn mine has struck some fine gravel similar to that of the Bald Mountain, and is expected to commence taking out pay in a short time. The Sierra Buttes tunnel No. 9 pierced 500 feet of this gravel while running their 7000-foot tunnel on the 2000-foot level. Indications point to this property as immensely rich.

The Bonanza, Young America and Phoenix are shut down, awaiting arrangements for their further development.

### Siskiyou.

*Journal*: The McConnell & Quinn claim is in operation, under lease to Chinamen, who get 80 per cent of the proceeds.

The pumping plant at Shasta river is kept in constant operation in furnishing water for the giants at the Espey, Hunter & Co. mine.

All the mines around Oro Fino are running at full blast, with a bountiful supply of water. A large number of men are employed in the mines in this section during the busy season.

The American Bar Co. at Klamath river expects to be in readiness for hoisting pay gravel inside of two weeks, and anticipate taking out considerable gold before the winter storms commence again.

J. H. Smith of the firm of Hale & Smith, railroad contractors of Portland, Or., and one of the stockholders in the Seattle Placer Mining Co., is now superintendent of that company.

While hunting cattle in Beaver creek A. Condrey discovered an exceptionally fine asbestos ledge. He intends doing considerable work this spring in developing the property.

J. C. Wood of Nolton, Siskiyou county, has bought from the Seattle Placer Mining Co. a sawmill, which has a capacity of 6000 feet a day.

### Trinity.

AT HAY FORK.—Pragmore, Gray and Duncan have located a ledge and gone to work taking out quartz and building an arrastra. The mine is four miles from Hay Fork and twenty-eight miles from Weaverville.

Two other mines are being opened on Kingsbury gulch.

### Tuolumne.

*Democrat:* Operations on the Louisiana mine, at Cherokee, will shortly be resumed.

The new twenty-stamp mill on the App mine, at Quartz Mountain, started up Thursday.

J. T. Faxon of Sonora, has a location on the mother lode, named the Isabella-Gem-Consolidated, a continuation of the Rawhide and Rappahannock mines.

Work on the Seminole and Mayflower group of mines which recently ceased, is to be soon started again. The company has decided to do 1300 feet of tunneling, drifting and sinking. While this work is in progress sufficient ore will be taken out to keep the mill on the Seminole mine in operation. Col. Coles, is the superintendent.

At the Mt. Zion mine, near Groveland, recently bonded to the Tuolumne County Mining and Development Company of Fresno, for $5000 will be in order. It is proposed to sink a shaft and run a tunnel.

## NEVADA.

In Mason valley a new custom mill to be run by water power is about ready to start up. The ditch has just been completed. In Spragg and Martin districts there is a large amount of gold quartz on the dumps and the mines are steadily improving in richness. The mill is not large but is first-class in all its appointments.

Some rich gold mines are being opened in Spring Valley, Washoe county, near Steamboat. A lot of 400 tons now on the dump will be handled at the Reno works. Assays show that it will pay well.

The mine discovered by Indian Jim, down in Douglas county proves to be wonderfully rich, and a five-stamp mill is being set up to work the ore. The vein is all alive with free gold.

The Raycraft brothers will now themselves work the Buckeye placers. They will get water by laying an iron pipe from a lake to their diggings.

### STOREY COUNTY.

ON THE COMSTOCK.—The *Enterprise* says: The point on the lode which is being watched with the greatest interest is the 750 level of the Occidental. It is expected that in about three weeks the ore body encountered on the 550 level will be encountered.

In the leading Comstock mines all is going on about as usual. At Con. Cal. and Virginia the past week the yield from the 1650 and 1750 levels was 113 tons of ore of the average value of $47.57 a ton. At the Ophir old works ore averaging $10.50 a ton is being taken out on the old tunnel level. It is nearly all gold. During the week just before the trouble culminated between the miners and the newly appointed Supt. Tangerman, which resulted in their running him out of the town, twenty-seven carloads of ore were extracted on the 975 level of the Hale & Norcross assaying $25.29 in gold and thirty-one and seven-tenths ounces silver per ton. On hand in the ore-house is about 200 tons of ore. At the Occidental the gold vein found on the 650 level has been followed a distance of 94 feet to the southeast and is still in fair grade ore. A cross-cut is being run on the 750 level to tap this rich chute of gold ore at that depth. In the work is being used a fourteen-horse power Danish best crude oil engine, driving a Rix air compressor that runs the drills. This oil engine is a new departure on the lode.

The official weekly letters from the Chollar and Potosi say:

CHOLLAR.—In the stope above No. 2 crosscut, 450 level, and the south drift from it, we are assorting old fillings on the sixth floor and saving the bunches of pay in place lying to the west of the old stopes. In the south stope near old Potosi shaft we are opening to the south on some fair grade ore, and turning over the old fillings at that point, from which we are able to save about half as pay. On the 100 level the south drift from No. 2 west crosscut was extended 30 feet and stopped, the face remaining in low grade material. We are engaged on repairs in the north drifts on the 450 and 550 levels. We have saved during the past week 54 tons and 800 pounds of ore, the average top car sample of which was $40.66, silver calculated at par.

POTOSI.—The upraise from the south drift, 450 level, has extended 7 feet, and is now up 84 feet, at which point it has been temporarily stopped, and we are now engaged in opening another compartment to the east with the intention of ultimately connecting it with the south drift on the tunnel level, now being opened. The top of the raise shows the same vein matter reported last week, except that the quartz has given place largely to clay. The west drift on the 650 level has been repaired and retimbered for a total distance of 338 feet from the shaft. On the tunnel level

we are making good progress in the repairs of the south drift and have completed 200 feet. At the Brunswick lode good progress is being made at all points, but there is as yet no find of value to report. The Savage company has worked at the Mexican mill 550 tons of ore averaging $22.69 a ton. Their concentrates average $304.24 in gold and $468.24 in silver, a total of $790.48.

On the outside Dan De Quille in the Salt Lake *Tribune* reports that the ore from the Logan mine at Como is to be worked at the Rock Point mill, Dayton. There are now 600 tons of ore on the dump. With this accumulation in the start the mill can be kept going.

### OREGON.

BAKER COUNTY.

The French mining and exploring syndicate of Paris and Havre has purchased the Flagstaff mine, in the Virtue-Columbian district, the consideration being $20,000. Work has been resumed on the Snow Storm and Lilly White mines, in the Sanger district. A large body of rich quartz is exposed in the 600-foot level of the Virtue mine.

*Democrat*: The Exploring Syndicate of Mines and Mining Company, composed of Paris, Havre and Brussels capitalists, have bought the Burnt River placers, the Clark's Creek gravel mines, a tract nearly six miles square, the Flagstaff quartz mine in the Virtue district, making an investment of upwards of $100,000.

H. H. McIntire, Minneapolis; U. L. Lamprey, St. Paul; and W. H. Young, Butte, have recently purchased the Golconda mine in Cracker Creek district.

Col. H. Wolters of Louisville, Kentucky, is at the head of a newly organized company which owns the Red Jacket and other mines at Cornucopia, formerly owned by the Oregon Gold Mining Company. The new company contemplates extensive operations and resumption of work at the Red Jacket mine and mill.

JOSEPHINE COUNTY.

*Courier*: A. W. Silsby has arranged to haul ten tons of copper per day from Waldo to Grant's Pass, the work to begin as soon as the roads can stand it. The railroad has made some concession to the Elmer Bros., and carload lots of twenty tons each will be sent to Baltimore.

The difficulties between the Black Gold Channel Mining Co. and J. Bouse, the lessee of the mines on Foots creek, have been adjusted. A certificate was given by the attorney for the company to Mr. Bouse, stating that the development work done is satisfactory and the lease remains in force until May 1, 1896. In turn, Mr. B. has entered into an agreement to pay all debts for labor and material which have been or may be contracted during the life of the lease. He claims that he will now be able to raise the required funds with which to pay the debts contracted during his regime.

### WASHINGTON.

A two-thirds interest in the Friday mineral claim, in the Squaw Creek district, is reported sold to Captain Griggs of the steamer Ellensburg for $10,000. Three cars of ore shipped last fall gave a gross return of $93 a ton. The mine is developed by a shaft eighty feet in depth and a tunnel in 300 feet. This is expected to cut the vein at a depth of 130 feet.

Miners have arrived at Monte Cristo from the Michigan and Wisconsin copper regions. Work of driving Mystery Number Three is going on. It will soon reach the Pride of the Mountains workings and will take the place of the tramway now running to the concentrator for bringing down ore. The concentrator was shut down for a portion of last week on account of the Mystery tramway again getting out of repair. The big concentrator will again begin running with the west side of Golden Chord ore. Mr. Nicholson, who has been foreman of the Union Concentrator Company's concentrator and the Mystery and Pride of the Mountains tram lines, has resigned and his position is being filled by Mr. Taylor.

### BRITISH COLUMBIA.

The Morning Star Gold Mining and Milling Company of Rossland has incorporated under the act of 1862 of the old English law for $1,000,000 at $1 per share, with 200,000 shares of treasury stock set aside for development purposes. The Morning Star full claim is 1500x1500 feet. P. A. Largey is superintendent.

At Rossland the Le Roi closed down on the 16th until the skip is in order.

The British Columbia *Mining Journal* says: Stock in the Cariboo mine is now selling at $17 per share. It will decrease in price somewhat by raising the amount of capitalization from $300,000 to $500,000. Horsefly hydraulic stock, we are informed by Vancouver brokers, is now selling from $10 to $12 per share.

The Silver King tramway will be cut in two.

Ontario produced $65,000 worth of gold in 1895.

The Nelson smelter commenced its second run last week.

The output of British Columbia coal for 1895 was 939,634 tons.

### ALASKA.

A letter written by G. R. Voss, dated Forty Mile, Jan. 23rd, says: "Quartz veins have been struck and a mill will be started in July. The ore is low grade, averaging about $8 per ton in gold, but free milling. Miller creek, in this district, will yield a large sum of money this winter, and Glacier creek will not fall far behind. Quartz mining will make this a permanent camp. Circle City is a placer camp, for it is off the quartz belt. We have had a very severe winter, the thermometer registering 72° below zero on Jan. 3rd, and it was 62° below yesterday."

Horses are a great help on the Yukon, but the animals are scarce and their services hard to get. Most of the freighting is done by dog teams. From Fort Yukon to Circle City, a distance of eighty miles, freight costs 15 cents per pound. From Circle City to the mines, seventy miles distant, in winter 15 cents per pound and in summer 45 cents per pound. A deerskin canoe costs $5, mooseskin gloves $2.50, and moccasins $2.50 per pair.

Twenty-five Yukon sleds, some of them made to be hauled by hand and some to be pulled by dogs, piles of furniture and stacks of miners' "packs" are to be seen in the ocean warehouse on the Northern Pacific wharf, says the Tacoma *Ledger*. They are to be placed aboard the City of Topeka and with their owners sail for Alaska. The exodus for the northern territory continues. It is becoming a rush. So great is the demand for tickets that the Pacific Coast Steamship Company's local agency is unable to fill all requests and many are sent away who otherwise would have gone on the Topeka. The twenty-five sleds piled up in the warehouse represent twenty-five Yukon-bound parties. With each sled is a complete outfit.

### UTAH.

*Tribune*: The periodical story concerning the presence of free gold at Mercur may be true, but it is generally discredited by experienced miners. Several times in the past few weeks stories of this nature have been put in circulation, and while such a thing may occur in any formation, it is not likely to be found in place or in sufficient plenteousness to ever induce the miner to believe that Camp Floyd is other than a cyanide proposition.

AT SILVER REEF.—*Review*: The great sandstone reef that surprised geologists by producing $14,000,000 worth of silver is still being worked by "chloriders," men who explore the workings of the old mines for little pockets of rich ore that have been overlooked, and some of them are earning much more than wages. Mr. R. C. Lund of St. George, who was in Salt Lake last week, reports discoveries in the Thompson mine of large bodies of sandstone that carry from forty to sixty ounces in silver. The reef, he believes, is not half worked out, and were silver $1 an ounce Silver Reef would be a very lively camp. The Barbee & Walker custom mill will soon be started up on one of its periodical runs for the purpose of treating the sandstone taken out by the "chloriders." This is a five-stamp mill, but so soft is the rock that it crushes fifty tons per day, and the run usually lasts about six weeks. There are two other mills in the district, but they have been idle for years. The richest of the Silver Reef mines have been worked out down to the water level, and could some economical method for draining the ground be devised they might still be profitably operated. A project to generate electric power in the Rio Virgin river, six miles distant, and transmit it to Silver Reef for the operation of electric pumps has been under consideration, but it is doubtful whether anything will be done while silver remains at its present figure.

### IDAHO.

Supt. Jennings of the Star mine, at Hailey, says he has an ore chute 400 feet long, with 100 feet of backs. He intends to put in a hoist and sink 300 or 400 feet. There are twenty men employed.

The Columbia Company, at the Yellow Jacket, has bought a cyanide process for the reduction of the ore in the Columbia mine at the Yellow Jacket, says the Salmon *Republic*, which will treat fifty tons a day. The ore will be crushed with Cornish rolls, roasted and treated with cyanide.

AROUND PIERCE CITY.

(Special Correspondence)—Golden Reward.—Work on this claim is being rapidly pushed ahead. The tunnel was driven 24 feet last week. There is about 8 inches of ore in the face, but it is refractory, and the owners are getting out a carload of the best of it for shipment.

Idaho Group.—This property is closed down for the present, as it is necessary to make some improvements in the mill and put in a concentrator.

Bond.—The Crescent Co.'s mill is running as usual, but with a smaller force of men in the mine.

Frisco.—Owing to water the work was suspended on the shaft at 60 feet, and a tunnel to tap the shaft is being driven, under contract.

Mother Lode.—This claim, owned by Messrs. Pasold, Jacobs & Gilbert, and which adjoins the Frisco and Bond, is being developed. Good ore is being uncovered.

Golden Ribbon.—The shaft on this property is still going down. The ore is rich but small.

Miner.—It is rumored that this property has been bonded by Chicago parties, but the consideration is unknown. There have been over $75,000 expended on this property in development work and machinery, a Crawford mill being among the latest additions.

Lock and Key Group.—This property, owned by I. B. Cowan and others, is showing up well. Free gold is visible in the ore. It runs about $50 per ton. The paystreak is about 20 inches wide. It is the intention of the owners to put a stamp mill on this property when the snow goes off.

Placer miners are all busy now and the camp is resuming a more life-like appearance. This camp will most likely have an unusual rush of men looking for employment this summer, and of course large numbers will be disappointed, who come here expecting to make a stake in a season.

Amongst the placer mining companies business will be good this season on account of the heavy fall of snow.

Rouch, Crowley & Grun are busy getting in shape to make a big cleanup this season.

Dr. J. H. Morris & Co. are preparing to start up their pipe, but they have over 8 feet of snow on their property on the headwaters of Oro Fino creek. They will not manage to do much for a few weeks. They have in 600 feet of flume and estimate they will average $1000 per month, with two shifts. Gravel will average 4 feet in depth and go 40 cents to the yard. Last summer they expended $3000 on this property.

Pierce City, Idaho, Nov. 20, '96.

### MONTANA.

*Miner*: The Atlantic shaft of the Boston & Montana Company has reached a depth of over 500 feet.

The Bozeman mine, at Pony, which was bonded by Merrill, Cowan and Gamer, is sold to H. Albertson, et al., under bond, for $30,000. Five thousand dollars of this amount had been paid some time ago. The new owners will start at once to develop the property.

At Phillipsburg Superintendent Babcock of the Golden Scepter Gold Mining Company will put up a 100-stamp mill. Each stamp will weigh 900 pounds. He will also build a six-mile cable road, which is to convey the ore from the mine to the mill, and put in a 900 H. P. electric engine, which will furnish power for the trolley cars and for lighting the entire camp with electricity, and which will also furnish power by which the mill will be operated; a 10-drill air compressor and other necessary machinery.

The Golden Scepter Mining Co. at Bonito has decided to erect a 100-stamp mill and construct and equip an electric road five miles long, from the mine to the mill.

### WYOMING.

The Spring Creek Placer Mining Company, operating placers in the Douglas Creek district, southwest of Laramie City, has disposed of 300 acres of placer ground to Ohio parties for $30,000 cash. The Spring Creek Company is composed of five Cheyenne and Laramie men who worked the placers last season at a profit and were preparing to work them during the coming season. The sale nets them $5000 each over their investment, and they still own several hundred acres of valuable placer ground.

### COLORADO.

The sale of the Niagara mine and Niagara Extension to Pittsburg parties, the consideration being $75,000, of which $25,000 was paid for possession, is reported from Central City. The shipments have been of high grade; returns on a seven-ton lot of unassorted ore gave 6.01 ounces in gold and 9.60 ounces in silver per ton. The whole vein is mined as smelting ore.

Cripple Creek *Mail*: The Elkton produces monthly 334 tons, average value in gold $112.15, with a total output of $39,463; the Garfield-Grouse, 15 tons, $230 values, total output $3,600; the Jack Pot, 19 tons, $600 values, $11,400 output; Victor, smelting, 159 tons, value per ton $255.34 gold, $2.87 silver, mill ore 501 tons, $20 value, with a total output of $51,234.42, last dividend 10 cents; Anaconda, smelting, 126 tons, gold value $72.64, milling 330 tons, gold value $19.86, total output for both, $15,776.58; Cripple Creek Consolidated, 5,085 tons, with an average of $100 per ton to March 1, 1896.

A very interesting and somewhat annoying condition of affairs has arisen in the smelting industry of the State, and has affected the plants all over Colorado. It is, in brief, a silica famine. There is such scarcity of silicious ores at the present time that the Philadelphia smelter of Pueblo has been compelled to shut down several of its furnaces. Some of the Denver plants are also affected, but thus far none of the Leadville smelters have been compelled to close down any of their furnaces, although it has been very close "scratching." The scarcity of the silicious ores is due to the fact that most of the mines which have been supplying this class of ore have practically ceased taking it out. Many of them have, it would appear, run out of the ore, while one or two have closed down.

Cripple Creek *Times*: Statistics from the Pueblo smelter show that the average value of all ore received there from the Cripple Creek district for 1895 was $120.24 per ton.

SUED FOR $450,000.—*Chieftain*: In the suit of A. M. Hendry against the Pueblo Smelting and Refining Company, Hendry sues the smelter for $450,000, and states that in 1892, '93 and '94 certain parties, by force of arms, wrongfully and unlawfully broke into a vein of mineral within the surface boundaries of the Anaconda mining claim, situated in the New placer mining district, in Santa Fe county, N. M., and took out 4000 tons of silver, lead and gold-bearing ore, with an average value of $100 per ton. The parties who took out the ore caused it to be shipped to the defendant in this action, which converted it to its own use. He asks for $450,000 damages and costs of suit. The company admits that it did get some ore from that property, buying it in good faith from the Lincoln-Lucky Mining Company. No such amount as that named in the complaint was ever received and what was purchased was far from being $100 ore, but, instead, averaged between $15 and $18, the highest running in the neighborhood of $40. The Anaconda claim and Lincoln-Lucky claims crossed each other and the two companies had some trouble over their veins, and the suit is probably an outgrowth of that controversy.

### NEW MEXICO.

The Old Abe gold mine at White Oaks caved in last week from the first to the sixth levels, or 700 feet. The miners were out to dinner at the time or there would have been heavy loss of life. The loss is estimated at $50,000. About a year ago the timbering of the mine caught fire and a number of lives were lost.

Silver City *Sentinel*: Bell & Stevens are working men on the Mina Grande mine at Pinos Altos sinking two shafts, seventy feet apart, to the main ore body. The vein is from two to three feet in thickness, is easily mined and carries about $20 in gold per ton. The ore is free milling and will be treated at the Bell & Stevens mill.

The Eberle mine at Mogollon is employing five men on tunneling and development work. F. X. Eberle, the owner of the property, says he intends soon to erect a fine mill.

Work is progressing on the smelter at this place, ore and supplies are being received daily, and the plant will open for a successful run some time during the latter part of the month. The company intended to start the works about the 15th, but upon close examination of the furnace it was thought unwise to blow in until they could procure a new one to take its place. They ordered a new furnace and expect its arrival in a few days.

The Newcomb mill, at White Signal, is nearing completion.

F. R. Brown, manager of the Deep Down mine at Mogollon, has new machinery for the mill. On the 40-foot level the vein runs from 9 to 30 feet wide and has a pay streak from 8 to 10 feet wide. Much of the ore runs $16 per ton. The present cost of taking out ore is $1.10 per ton.

### ARIZONA.

Miners along the Hassayampa are jubilant over the prospect of starting reduction works in Prescott.

The Volcanic mines near Gila Bend are reported to have been sold by Benjamin E. Lower for $50,000. The purchasers are to erect a fifty-ton smelter.

A Prescott dispatch says the first payment by Ohio men has been made on the Blue Dick mine, eight miles from Prescott, and that the new company expects to spend $150,000 at once.

James Douglas and Supt. Cook, representing the United Globe mines at Globe, have decided to build a tramway between the Buffalo mine and the smelter.

At Goldfield the Mammoth people are continuously prospecting, exposing ore in different places, and have sufficient ore ahead to run the mill. The last working of consequence is 1000 feet south of the old shaft, where the work was continued to a depth of 80 feet, which exposed ore of considerable richness. From a point 15 feet from the surface down a drift was run from this shaft, sunk on the hanging wall, to the other wall, about 70 feet through ore.

The Bull Dog mill is running steadily on ore principally from the Highland mine.

South of the Bull Dog the owners of the Cousin claim are sinking a 50-foot shaft, and at a depth of 18 feet free gold was found in pockets. The ore is heavily copper-stained and is from 4 to 6 feet in width.

The Pomeroy mill is being put in order and will be run by N. Wheeler.

The Phœnix *Republican* says there is now a prospect that Harqua Hala camp is soon to regain its ancient glory. The old mine, it is true, is closed down, perhaps for ever, as the diamond drill fails to develop any more such wonderful bodies of ore as were uncovered by Hubbard & Bowers. The mill is now working on tailings from the old dump, and a fair record made by the aid of cyanide. When the tailings are done with then it was proposed to ship the mill to Australia. But it appears probable that the machinery will be soon again running on ore from a near-by strike. Immediately adjoining the Harqua Hala Bonanza group, and exactly parallel, across a little gulch, is a claim owned by Quinn brothers, with whom, however, are associated Sullivan & Hall, the Goldfields miner magnates. This is the mine that is believed to have in it all the elements of a bonanza of the first rank. The Quinn claim is as yet but little developed, yet at an inconsiderable depth has been exposed an ore body 12 feet in width that assays from $15 to $50 to the ton in free milling gold. Unlike the Bonanza, it would appear to have a well-defined ledge, and the profit from its workings is sure to be immense. The showing thus made has encouraged the mine owners of the Harqua Hala and Eagle Tail districts to start development work to uncover the hoped-for underground riches.

GILA COUNTY.

*Silver Belt*: The deal was closed last week by which the New York stockholders in the Kasser Gold Mining Company acquired the interests in that property of R. E. Humphrey and C. H. Hill, and the first payment has been made. Recent developments have proved the value of the property and the ore is said to be now more abundant and of a higher grade than at any time since the company began operations. A pipe line, nearly a mile in length, is to be put in about April 1 to increase the water supply. Considerable bullion has been produced during the past three months and the outlook for future success is bright.

### SOUTH AFRICA.

South African *Mining Journal*, Feb. 8: Mr. Howard Hill, the capable manager of the Sheba Co., has sent his resignation in to his board and it has been accepted. In the meantime the company under his charge is apparently experiencing a return to the palmy days when the yield per ton was reckoned in ounces. Lately 1¼ ounces have been obtained, and during January a record output has been achieved. Sixty stamps crushed 3130 tons, the mesh used being 1600. The gold produced was 7391 ounces 15 pennyweights, equal to 2 ounces 7 pennyweights per ton, and this was supplemented by 2139 ounces 3 pennyweights from the cyanide vats. The total recovered was 9530 ounces 18 pennyweights, and if the 479 ounces, which is the assay value of the concentrates, be added, the total is 10,010 ounces from sixty stamps. This is, perhaps, the highest return yet obtained in South African mining from sixty stamps, and the return clearly shows that there is still good stone in the Sheba. The incoming manager is not likely to be grateful to Mr. Hill for establishing such a record, as unless the quality of the stone is everywhere improving it will be difficult to maintain the figures for January. The total production of the Barberton fields during 1895 was about 60,000 ounces, and this yield of the Sheba is at the rate of twice this quantity from one mine alone. How long will it last?

## Recent Publications Received.

"*A Practical Treatise on Compressed Air and Pneumatic Machinery,*" by Edward A. Rix and A. E. Chodzko, pneumatic engineers for the Fulton Engineering and Shipbuilding Works, San Francisco, manufacturers of mining, milling, smelting and electrical machinery, a handsome brochure of 222 pages, black and gold, elaborately produced in flexible leather binding, the general appearance of the book being the same as Haswell, or Kent's Mechanical Engineers' Pocket Book. It is a California production throughout, including authorship, subject and mechanical detail. It treats of work done by a California firm, by California engineers; the curves, tables and engineering data are original and were specially prepared by the authors; the matter treated of is not theoretical or suppositious, but is a tangible creation in successful operation. While in the abstract the subject is an interesting one to civil and mining engineers and others, the contents are of practical value, and the book goes beyond being a mere addition to current technical literature, as it adds to the sum of knowledge on a scientific subject of present practical importance. Copious illustrations and sectional drawings accompany the discussion of the different types of air compressing machinery. An interesting feature of the work is the reproduction in its entirety of a handsomely illustrated article on "The Pneumatic Torpedo Plant at the Presidio," written by E. A. Rix, and which originally appeared in the *Journal of Electricity*. Mining men and engineers in the west half of America will find the data of practical value, and up-to-date on compressed air and its successful application as a motor. The price of the book is $4, postpaid. It may be ordered from the Fulton Engineering and Shipbuilding Works, No. 213 First street, San Francisco, or from the Rix Compressed Air Machinery Company, 11 and 13 First street, San Francisco.

"*Journal of the Association of Engineering Societies for February, '96,*" the leading article being a paper on "Engineers—Consulting, Inspecting, Contracting: Their Relationship to Each Other and to Their Clients," read by Geo. W. Dickie, of the Union Iron Works, at a meeting of the Technical Society of the Pacific Coast at their rooms in the Academy of Science Building, this city, June 2, '95, with discussion thereon by John Richards, C. E. Grunsky, Otto Von Geldern, Randall Hunt and other prominent members of the society. "Triangulation Preparatory to Alignment of a Tunnel" constitutes the principal remaining contents of the journal, which, with its twenty pages of advertisements, presents a prosperous business appearance.

"*The Engineering Magazine,*" edited by Jno. R. Dunlap, Times Building, N. Y. Special mention is due this industrial publication, and its special value to engineers. Science is simply organized knowledge; art, the application of science; and the science and art of civil and mining engineering finds scope and representation in the pages of this excellent magazine. While the MINING AND SCIENTIFIC PRESS cannot agree with the editorial views of the *Engineering Magazine* as to "sound money" and kindred topics, yet these are largely matters of opinion, influenced by environment, and are to be regarded without prejudice. The inevitable article on "The Roentgen Rays" is of more than ordinary serial importance, being written by M. I. Pupin, who occupies temporary prominence by reason of experimental work in connection with this new radiance. "Prospecting with the Diamond Drill" is of interest and value, and the article reproduced in these columns on the 21st inst., "Practical Assaying at Mines and Works," by a practical man, is also of special value. The *Engineering Magazine* has several features that should commend it to the Pacific coast: it is not hidebound; it recognizes difference of thought and tries to be just without being unduly generous; it every month presents a complete and valuable descriptive index of the leading features of the leading scientific, engineering, mining, electrical and other industrial journals of all English speaking communities, giving the name, where it appeared, what it is about, its length, number of words, and undertakes to furnish the article to any one for a trifling amount, varying from 10 to 25 cents; it has departments edited by skilled specialists, treating of nearly every phase of industrial life, in each of which a happy medium seems to be struck between the intense conservatism of the duller technical publications and the quasi-scientific sensationalism of the daily press, the general impression in the mind of the reader being that the statement is reliable. The price of the magazine is $3 per annum, and it is well worth the money.

"*Sigmogomphius Le Conte, a New Castoroid Rodent from the Pliocene near Berkeley, Cal.,*" by Jno. C. Merriam, is issued by the University of California as a special bulletin, being descriptive of fossil rodent remains and the geological formation in which they were imbedded, with some observations and deductions therefrom. Bulletin No. 12 from the University is on Malignite, a family of basic plutonic orthoclase rocks rich in alkalies and lime, intrusive in "The Contchiching Schists of Poohbah Lake," by Andrew C. Lawson, with full geological and mineralogical details, chemical analysis, and scientific discussion thereon. Among Prof. Lawson's concluding remarks are the following: "The interest attaching to the rocks described in the preceding pages is twofold. To the systematist they furnish new material for any detailed scheme of classification of rocks. To the student of petrogenesis, to whom artificial schemes of classification are liable to be a hindrance rather than a help, they afford another instance of a very sharply defined petrographic province in which the different types of rock are undoubtedly the products of differentiation from a common magna. The most striking fact which a review of the petrographical descriptions discloses is that intensely contrasted mineralogical, structural and textural variations are the concomitants of very moderate changes in chemical composition. This is well illustrated by a comparison of the analyses of the garnet-pyroxene-malignite and the amphibole-malignite."

"*Catalogue of the Brown Hoisting and Conveying Machine Co., Cleveland, Ohio,*" 89 pages, 6x9 in., well gotten up typographically, and descriptive, from the commercial point of view, of the cranes, hoists, etc., manufactured by that company.

## Coast Industrial Notes.

—A sub-port of entry will be established at Santa Barbara, Cal.

—Eastern men propose shortly to complete a $200,000 brewery in San Diego.

—The rock-crushing plant at Folsom will be in operation by the 15th of April.

—Vallejo, Cal., citizens have organized the Vallejo Ferry Co., capital stock, $60,000.

—The Nevada County power company has bought the Grass Valley, Cal., electric light works.

—The expected raise in Los Angeles oil has come about. It is now rated at the exchange at 80 cents per barrel.

—The Capital Electric Light, Motor and Gas Company of Boise, Idaho, will double its capacity. The improvement will cost $20,000.

—The battleship Oregon is about finished at the Union Iron Works, and is now receiving a general going over preparatory to her trial trip.

—New Whatcom and Fairhaven, on Bellingham bay, Wash., are now given out as the probable salt water terminus of the Great Northern.

—Last Saturday the Risdon Iron Works of this city signed a contract with the Harbor Commissioners for the wrought steel work on the new Union Depot building for $188,000.

—The barkentine Behring, the first Russian sailing ship to visit this port for twenty years, arrived last Saturday from Yokohama, to load general cargo for the Russian Sealskin Co.

—To date the San Francisco and San Joaquin Valley Railroad directors have paid out $1,222,250 for construction. The road is built to the Tuolumne river and in another month will have reached the Merced river.

—The contract for 2200 tons of steel beams and girders for the new nineteen-story Spreckels building, corner Third and Market streets, this city, has been let to the Pacific Rolling Mills, the largest contract of the kind ever given out on this coast.

—The South San Francisco pottery, owned by Steiger Bros. of San Jose, has suspended operation. About seventy employes are out of work, and future operations are uncertain, though it is believed that the proprietors, who are honorable men, will be able to adjust all financial matters and resume.

—Eastern Oregon reports being overrun by useless horses, which are becoming wild, and the people are at a loss to know what to do with them. There are 100,000 horses in eastern Oregon that cannot be given away, and they must not be allowed to run wild on the ranges, for they will breed so fast that the country will be ruined by them.

—A new method of hauling logs has been introduced at the camp of McDougall & Jackson, near Arlington, Wash. They employ an endless cable, two miles in length, which is operated by a stationary engine at the landing. The firm cut 12,000,000 feet off of one claim (160 acres) last year, valued at $43,000, said to be the most profitable claim ever cut in the State.

—On the first of March the wages of men employed on the Miller & Lux ranches in Mason Valley were reduced from $25 to $20 per month. The men, including those who were feeding cattle, quit work and published a card in the Yerington *Rustler* in which they say they ask nothing unreasonable, and if Miller will restore the old rate they will go back to work.

—Washington State's lumber shipments by rail for the first sixty days of '96, were 16,399,000 feet as against 8,440,000 for the corresponding period of '95. The shingles taken out of the State in the two months of 1896 were 179,520,000 as against 220,480,000 in the corresponding months of 1895, a falling off in shingles of 40,000,000, while the lumber shipshipments doubled in the two months over those of last year.

—Some ambitious Arizonians last week incorporated at Prescott the Saluda Southern Railway Company, capital $19,755,000, to build 878 miles of road from a new town to be started eighteen miles north of Phœnix upon the land of the Rio Verde Canal Company, which company is now constructing a water-storage system on the Verde river and a canal, and expects in two years to irrigate 200,000 acres in the Salt river valley.

—In 1860 the assessed valuation of what is now the State of Washington was $4,394,735, with a population of 11,694; in 1870 the valuation had increased to $10,642,863, with 23,955 population in 1880 the valuation was $23,810,693, with 75,116 population; in 1892 the valuation was estimated at $400,000,000, with 375,000 population. Now it is estimated at $450,000,000, with the population estimated by Governor McGraw at 415,000, Jan. 1, 1896.

—A colony of 100 Slavonians from the Eastern States led by Rev. Mr. Jeram have secured 40,000 acres in Eden valley, Mendocino Co., and will attempt settlement there on the co-operative plan. There are 100,000 shares of stock at $5 per share. Each settler must have twenty shares. Having fifty shares entitles one to a lot in a townsite. Some one will doubtless make some money in the scheme.

—The Puget Sound, Mount Tacoma and Eastern Railway Company has incorporated at Tacoma, Wash.; capital stock, $2,000,000. G. L. Holmes, P. V. Cæsar, L. R. Manning, I. W. Anderson, T. W. Enos, W. C. Wheeler, trustees. The enterprise is said to be backed by Eastern capital; object, to follow the Hart logging road, of which ten miles are already built, to Mount Tacoma, forty miles away, as a scenic route, and then build eastward to a probable connection with the Burlington.

—In reply to some recent notice herein of local comment on the price of electric power in Sacramento from the Folsom Water Power Co., the *Pacific Electrician* in its February issue, just received, says that the S. P. Co. has contracted for electric power for three of its shops in Sacramento at a cost of $50 per H. P. per year, and that any power user in Sacramento desiring power in large units can get it at that rate. The electric company is supplying about 950 H. P. in that city and earning more than its interest account and running expenses.

—The Western Packing Company of Portland, Or., which commenced the slaughter of range horses some six months ago, closed its abattoir Feb. 24. The company had slaughtered 7000 horses in all, and had a market for pickled horse flesh in Antwerp, but owing to Chicago packers having shipped a lot of flesh from diseased horses there, the Belgian Government closed the country against American horse meat on Feb. 1. Several tons of pickled horse meat were shipped to Japan as an experiment, but no market was found there and the meat was thrown into the ocean. It was found that the receipts from fertilizer made of bones, blood and waste meat, and from sale of hides, tails, etc., would not balance the cost of horses and slaughtering, and as no more meat could be sold for the present the establishment was closed. The company says it may reopen next fall, when the range horses are fat, and if it does it will establish a market in Chicago for the sale of horse flesh, as a number of persons there who have tried the meat have formed a liking for it.

—The decision of the Supreme Court sustaining the AlamedaCo. Supervisors in awarding the franchise from Oakland to Livermore to E. P. Vandercook has removed the last obstacle in the way of the construction of the road. A few months ago Mr. Vandercook went East and received many pledges of support for his road when the cloud on the franchise was settled. Now that the franchise has been affirmed the construction of the road will be pushed with all possible haste. The new road will start at the terminus of the present system managed by E. P. Vandercook at Fruitvale. From there it will go along the foothills toward Haywards, only keeping well to the north of the county road, which is traversed by the Haywards electric line. A branch will run from the main line to Haywards. The line will run to Livermore and thence to the Corral Hollow mines and will be operated by electricity and will be adapted so as to carry both freight and passengers. It will open up much new territory and such a line has been in demand for several years.

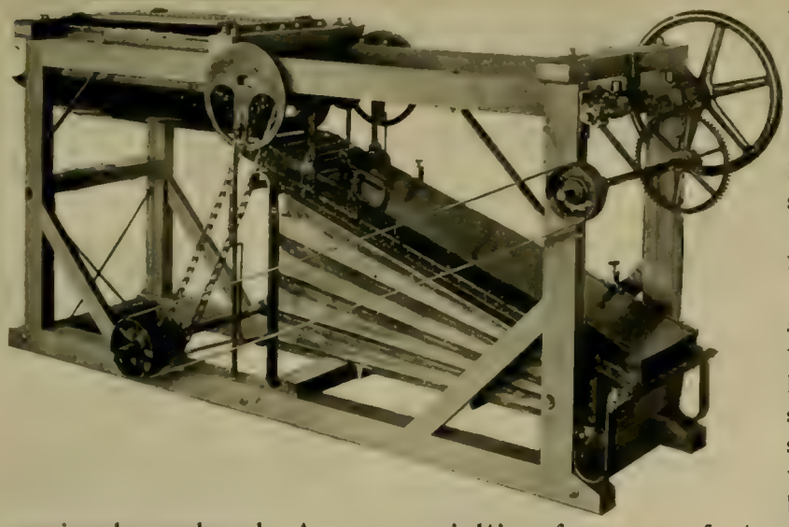
—The Manufacturers' and Producers' Association held its first annual meeting in the Chamber of Commerce building, on California street, this city, on the 25th. H. T. Scott, president of the association, occupied the chair. The several reports were read. The report of the secretary, L. R. Mead, has received previous notice herein; the report of Treasurer Sbarboro showed receipts for the year $8249.12, disbursements $8009.45. On motion the annual dues were increased from $6 to $10. The following gentlemen were elected directors: Horace Davis, H. J. Crocker, J. W. Kerr, A. Derham, W. F. Bowers, J. P. Currier, A. Sbarboro, M. J. Keller, M. McGlynn, A. McLaughlin, L. R. Mead. At a subsequent meeting the directors elected the following officers: President, Horace Davis; first vice-president, M. J. Keller; second vice-president, W. F. Bowers; third vice-president, H. J. Crocker; treasurer, A. Sbarboro; secretary, L. R. Mead; assistant secretary, Fred H. Dingle; manager, S. H. Tacy.

## Personal.

CHAS. BUTTERS expects to return from South Africa to Shasta Co. about July 1st.

SAMUEL BLIGHT of Grass Valley succeeds A. Walrath as superintendent of the Old Flag mines, Brown's Valley, Cal.

THE Amador *Record* says F. Pierce, who has occupied the position of foreman at the Oneida mine since work started up, has accepted a position in a New Zealand mine at a salary of $300 per month, and will leave for that country on the first of April. He will be succeeded in the Oneida by Mr. Comstock of Virginia, Nev.



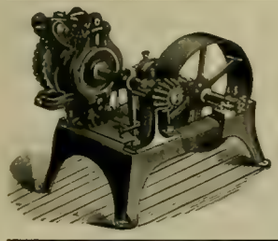
PROF. W. P. BLAKE, well and widely known, who is at present sojourning at Tucson, Arizona, has been invited by the Tucson Scientific Society to deliver a lecture on "Meteorites." As soon as the Professor began to look into the subject and take notes meteors began to fall all over the country—one in New Mexico—and several more are expected from different parts of the country purposely, no doubt, to supply the Professor with abundant material for his paper fresh to hand. It is to be hoped the Professor will not set out to lecture on earthquakes or he might be supplied with data to order greatly to general ill-doing and consternation.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.



WE make mining machinery of all kinds. We also "make the Miner," that is, Woods' Dry Placer Miner, as illustrated here. Users say it is "really perfect." In writing about it ask for catalogue 51.

Smelters are using our semi-steel moulds, kettles and pots extensively; they give first rate satisfaction. We are also making welded steel water jacket furnaces, better than anything previously produced. Among specialties of our manufacture are perforated metals; also riveted steel pipe for hydraulic lines. You will find us obliging in making estimates and giving particulars, as we aim to serve the interests of our customers in the best way.

The only successful device for saving fine free gold from clay, talc or slimy ores. Has been proven far superior to horizontal plates in every instance. Endorsed by leading millmen. Send for catalogue and price list.

MIDAS GOLD SAVING MACHINERY CO., 114 First St., San Francisco.

## The General Gold Extraction Co., Ltd.,

PELATAN-CLERICI PROCESS.

Patented in U. S. and Other Countries. Capital, £100,000.

London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.

This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.

Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.

Local Manager for U. S., F. CLERICI.

DETACHABLE BUCKET WIRE-RO E TRAMWAYS,

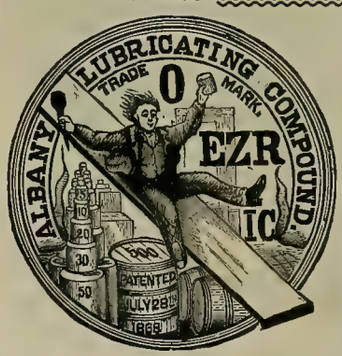
Roller Grinding Pans, Desulphurizing Furnaces, Etc.

Improved Self-Contained Cushion-Frame Five-Stamp Mill.
Patented in the United States and Foreign Countries.

The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill

FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.

SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.



THIRD: The Large Amount of Space Saved.

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List.

STAMP SHOES

STAMP DIES

These castings are extensively used in all the mining States and Territories of North and South America. Guaranteed to prove better and cheaper than any others. Orders solicited subject to the above conditions. When ordering, send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS & CO., Agents, 141 and 143 First Street, San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

## H. D. MORRIS & CO., DEALERS IN MINING MACHINERY AND SUPPLIES.

141-143 First Street, San Francisco, Cal.

MANHATTAN RUBBER BELTING, PACKING AND HOSE,
SANDERSON DRILL STEEL,
MORRIS CENTRIFUGAL PUMPS,
LIGHT STEEL RAIL.

## RIX COMPRESSED AIR MACHINERY CO.

MANUFACTURERS OF

AIR COMPRESSORS AND ROCK DRILLS,

OFFICE AND WORKS—11-13 FIRST STREET, SAN FRANCISCO

# Westinghouse Electric and Manufacturing Company,

PITTSBURG, PA.

The Largest and Most Completely Equipped Electrical Manufacturing Establishment in the World.

POWER, INCANDESCENT AND ARC LIGHTING, FROM THE SAME CIRCUITS.

We have purchased and are the SOLE OWNERS of the patents issued to Nikola Tesla for the POLYPHASE ALTERNATING SYSTEM, now recognized to be the most successful system for lighting and power purposes.

We furnish complete lines of apparatus for the perfect equipment of ISOLATED PLANTS for Hotels, Office Buildings, Flats and Factories.

STANDARD SYSTEMS

for distribution of light and power in LARGE MANUFACTURING ESTABLISHMENTS, MILLS and MINES.

WESTINGHOUSE ELECTRIC RAILWAY SYSTEM,

the Most Durable, Economical and Efficient on the Market.

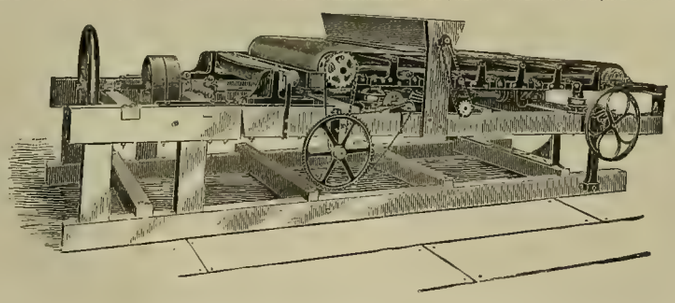
# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.



Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.

NINETY-FOUR AND ONE-HALF PER CENT
—SAVED—
ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.
SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION.
CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.
THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.
Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.
Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator.
You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,
E. L. BALLOU, Propr. Ballou Reduction Works.

# The Edward P. Allis Company, Milwaukee, Wis.

Established 1860.

# Market Reports.

## The Markets.

SAN FRANCISCO, March 26, 1896.

Rains the past week, with the outlook at this writing favorable for a general rainfall, are creating a feeling of more confidence in trade and manufacturing circles, which is doing no little in offsetting the feverish and unsettled feeling caused by failures among retailers the past winter. The conviction is gaining ground that, with weak firms forced to the wall, those remaining will be in better position and business rest on a more stable footing for the future. There is still free shipment of goods and machinery to Alaska; but with the next month this demand will fall away. From the gold-mining districts on this coast come confirmed advices of general activity. There is a large influx of miners and prospectors. In this city it is stated that there is a good inquiry for mining property, but few sales have been closed, although several are being negotiated.

In the money market there is more money held by the banks than before known; and while they are desirous of placing funds, still the best of security is demanded, which makes it bad for average borrowers to be accommodated. This discrimination is not confined to San Francisco, for the East reports a similar state of affairs. It is stated by the better informed that conditions at the East will change for the better, when the Cuban war talk blows over. Fears of foreign complication invariably have a bad effect. In Europe business has revived, and more activity is reported than for fully five years. The improvement abroad will extend to this country unless we should have a war with Spain, which is hardly likely to occur.

**New York Silver Prices.**

NEW YORK, March 26.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. | Copper. | Lead. |
|---|---|---|---|---|
| Friday | 31 3-16 | 68⅛ | 11 00 | 3 15 |
| Saturday | 31 5-16 | 68⅝ | 11 00 | 3 20 |
| Monday | 31 7-16 | 68⅝ | 11 00 | 3 15 |
| Tuesday | 31¼ | 68¼ | 11 00 | 3 15 |
| Wednesday | 31⅜ | 68⅜ | 10 75 | 3 15 |
| Thursday | 31¼ | 68¼ | 10 75 | 3 15 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.87 |
| London Merchants | $4.85 |
| London Sight Bankers | $4.88 |
| Refined Silver, per oz., 1000 fine | 68¼c |
| Mexican Dollars | 55@56c |

SILVER.—The market has continued to fluctuate. European advices state that the buying is not of a pronounced character and confined largely to India and The Straits. China does not as yet take much. The latter country has placed through the Hongkong & Shanghai Banking Corporation a new loan in England. It is for sixteen million pounds sterling, but the particulars are not likely to be made public for several days yet. What effect this new loan will have on silver it is hard to say. We are informed by a person who is in position to know that it calls for gold, and that the money is already in the hands of the London banks. He says that the money is for the purpose of paying war indemnity, and also building vessels of war and other national purposes. While this may be correct in the main, yet it is not at all reasonable to believe that China does not want to import silver. This demand is likely to come later, and if it does, the market ought to improve.

In the local market the situation is unchanged. Buyers do not appear to compete, which keeps the price fairly steady. The steamer Belgic for China took out the past week $61,650 in bullion.

MEXICAN DOLLARS.—The market holds steady at from 55 to 56 cents. The last steamer for China took out 214,000. Dealers report an improving demand.

COPPER.—The market at the East improved slightly, but was weaker towards the close. The export demand is very heavy, taking over one-half of this country's output. English mail advices state that the continent has been a heavy buyer. A private circular reports the London market as follows: "Locomotive builders are said to be full of orders until the end of the year. For war and mercantile ships much copper is being, and will be, required. Makers of copper wire are very busy (one order for 800 tons having recently been placed), and to-day the Government invites tenders for 800 tons of Wallaroo, Burra, or Lake copper—presumably for the manufacture of cartridges."

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

LEAD.—The market at the East advanced slightly, but towards the close it is weaker. The output in this country is said to be about the same as it was last year, as is the consumptive demand. In our market there is nothing new to report.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—Outside of a good demand for shipment up north, there is nothing new to report.

The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

QUICKSILVER.—The stocks held are reported large, but the combination holds at former quotations. The demand is said to be only fair.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 40 00 |
| West Coast of Mexico, for Export | 35 00 |

BORAX.—The shipments eastward continue to absorb the output on this coast.

The market is quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6½ |
| Refined, in sacks | 5⅞ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

TIN.—There is a light demand for both pig and tinplate. The bulk of requirements for spring purposes has been met. At the East and abroad the markets rule steady. If silver should advance, better prices would rule on speculative buying.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14¼c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—There is a fair Eastern demand. The market is quoted at 9 cents as an outside figure.

COAL.—The general situation is essentially unchanged. Large handlers and consumers do not seem disposed to anticipate wants to any extent. This conservatism is due to fears that the wheat crop will be large, which will send an increased number of coal-laden ships to this coast for outward cargoes. The spot market is steady, with a larger consumption of steam reported.

SPOT FROM YARD—PER TON.

| | | | |
|---|---|---|---|
| Wellington | $7 50 | @ | 8 00 |
| Greta | 6 00 | @ | 6 50 |
| Nanaimo | 6 50 | @ | 7 00 |
| Gilman | 5 50 | @ | 6 00 |
| Seattle | 5 00 | @ | 5 50 |
| Coos Bay | — — | @ | 4 50 |
| Cannel | — — | @ | 8 00 |
| Egg, hard | — — | @ | 13 00 |
| Walisend | — — | @ | 6 50 |
| Scotch Splint | — — | @ | 7 50 |
| Brymbo | — — | @ | 7 50 |

TO ARRIVE—CARGO LOTS.

| | | | |
|---|---|---|---|
| Australian | 5 25 | | |
| Liverpool Steam | 6 25 | | |
| Scotch Splint | — — | | |
| Cardiff | 6 25 | | |
| Lehigh Lump | 9 00 | | |
| Cumberland | 13 50 | | |
| Egg, hard | 10 00 | | |
| West Hartley | 6 50 | | |

COKE.—The spot market is in favor of buyers, which keeps distant or forward shipments inactive.

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 8 50 |
| " in sacks | — — | @ | 9 50 |
| Cumberland | — — | @ | — — |

LUMBER. — The export shipments from this coast continue free, which keep the market strong. In the local market the demand is only fair, but an improvement is looked for soon.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 16 00 | @ | — — |
| Pine | 13 00 | @ | 18 00 |
| Spruce | 25 00 | @ | 30 00 |

NAILS.—The market is quite firm. Considerable buying is reported in anticipation of an advance next Wednesday.

The market is quoted as follows:

| | |
|---|---|
| Wire, carloads, basis per keg | $3 07½ |
| " jobbing, " " | 3 20 |
| Cut, carloads, " " | 2 82½ |
| " jobbing, " " | 2 95 |

IRON.—In our market a good demand is reported. The placing of orders for structural and other purposes is said to be larger this year than for two or three years past. For one building alone over 2000 tons will be consumed by the rolling mill, which secured the order against Eastern bids. Eastern advices continue to note a decrease in the output of the furnaces, but it is still very large. The present weekly output will bring the aggregate for the year up to over 9,500,000 tons.

## Mining Share Market.

SAN FRANCISCO, March 26, 1896.

The market the past week was quite active from Friday to Monday at steadily advancing prices for Yellow Jacket, Crown Point, Belcher and Seg. Belcher. The rest of the market sympathized slightly. As the market began to setback for the above, it strengthened for Sierra Nevada and Union in the north end. When the two latter had advanced about ten per cent, the entire market showed more strength, with free transactions recorded in nearly every stock on the list. The strong market was followed by free selling from the bear contingent, which caused lower prices along the entire line. The largest decline has been in Crown Point, Yellow Jacket and Belcher in the Gold Hill group and in Sierra Nevada and Union in the north end. The advance in the leaders on the up move was slightly over double from the lowest prices for shares in the three Gold Hill mines and about 90 per cent in the shares of the two north end mines. This is the most pronounced up-move that has been made for many months and, as usual, only a few outside operators profited by it, for it is said they became too bullish at the wrong time. At this writing the market looks unsettled, and when this is the case it is dangerous for small operators. All kinds of disquieting rumors are afloat. That which creates the most fear is the turn affairs took at Virginia City when the miners took the law in their own hands and ran the newly appointed superintendent of Hale & Norcross, who is also superintendent of West Con. Virginia, out of that place. Fears are expressed that this may be followed by an appeal for protection, which would precipitate affairs at Virginia City and interfere with the workings of some of the other mines. So far the writer is not advised as to what course will be pursued, for the situation is being discussed and no definite understanding arrived at at this writing. Until this is settled on, it looks as if the market will be subject to slight ups and downs. What will be the outcome is purely guesswork. There can be no doubt that the work done and which is expected to be done in several of the mines is of a favorable character, and if affairs were settled would cause better prices.

An assessment was levied the past week by Gould & Curry, which will be followed within the next thirty days by several more.

The news from the Comstock mines reports continued active work, considering the number of miners employed, in Alta. While this is the case, it points to more time before definite results can be ascertained. In the Gold Hill group Overman and Belcher are still raising some ore, but it is not sufficient in quantity or value to have any effect. The work in Crown Point continues on several levels, but it is of dead-work character, which will be followed later on by exploiting the different levels on which they are now at work. Even with the starting of new work to the east and west, it will take considerable time before reaching the objective points sought. No news is allowed to leak out from Yellow Jacket, but it is reported that some work is being done, but on what level or in what direction it is not stated. In the absence of more definite information these reports may be put out for the purpose of influencing the market. The joint west drift that is being run by Confidence, Challenge and Con. Imperial continues to be driven slowly ahead. When this drift is extended still farther, it is stated that connection will be made with the lateral west drift which has been run by Confidence and Challenge into the Con. Imperial ground. With this connection made, considerable ground will be open for active exploiting. In Alpha more or less dead work to the west is still being made. In Potosi, Chollar and Savage of the middle group active work is still the order, with no particular change in its character. Some ore is being raised, but it does not cut any figure in the market. Work in Hale & Norcross is still suspended pending a settlement with the Miners' Union. The work in Gould & Curry and Best & Belcher is confined to the levels heretofore reported. In Con. Virginia exploiting work is being done on several levels; that under way on the 1000-foot level seems to attract the most attention. There are those who contend that an ore body is liable to be found within the next few months. Their opinion is largely theoretical and therefore may not prove correct, but it is to be hoped that they are right. In Ophir more or less active work is being done, without as yet encountering anything of an encouraging character. In Union and Sierra Nevada the work is not essentially changed since our last week's review. It is expected that the new work started will strike ore. From all that can be learned, it will take considerable time and money before finding out if there is much ore lying in the direction to which they are running. Work in Utah is confined to cleaning out and repairing an old west drift. When this is completed the drift, it is said, will be extended farther west.

From the Brunswick lode our advices continue to state that the work in Occidental is confined largely to extending the drift on the 750-foot level, so as to intercept the ore found above. If it is found to extend down, and is wider and of higher grade than found above, it will do no little in reviving interest in that lode. The work being done by the other companies on the lode is not calculated to excite attention, owing to its being preparatory to exploiting later on. When the latter is started then more interest will be taken in it.

From the Bodie district our advices state that a few tons of ore is being raised each week by Bulwer while prosecuting the work heretofore reported. In Bodie low grade ore is still found. The work in the mines in this district is not calculated to raise the expectation of shareholders that anything of much value is likely to be discovered soon.

The following illustrates the changes of the week:

| MINES. | Mar. 19. | Mar. 26. |
|---|---|---|
| Alpha | ..... | $ 10 |
| Alta Consolidated | $ 16 | 17 |

## Recent Mining Incorporations.

Atlas Mining Co., San Francisco; capital stock, $1,000,000, $250 subscribed; J. W. Pew, G. H. Waggoner, F. Avery, J. M. Quay, L. Samuels, San Francisco, directors.

Oro Camero, Blue Cement Gravel and Gold Mining and Milling Co., San Francisco; capital stock, $100,000, $500 subscribed; E. C. Rigney, W. S. O'Brien, Oakland, W. and M. G. Butterfield, Menlo Park, A. M. Hungerford, Sausalito, directors.

Union Gold Mining Co., San Francisco; capital stock, $5,000,000; G. E. Williams, Placerville, G. Lambert, G. H. Hawes, S. R. Stone, A. W. Bell, San Francisco, directors.

Minaret Mill & Mining Co., San Francisco; directors, E. J. Caldwell, G. R. Armstrong, H. J. Gallagher, J. H. Scott, R. C. Braun, J. Bamber, W. J. Tuska; capital stock, $2,250,000; $1200 subscribed.

Clear Creek Mining and Power Company; Redding, Cal.; capital stock, $50,000, all subscribed. E. Markwick, J. W. Hare, Redding; H. F. Eckert, San Francisco; H. R. Sorenson, Berkeley; H. P. Mudd, Shasta, directors.

Avalon Mining Company, San Francisco; capital stock, $1,000,000, $70 subscribed. A. K. Stevens, J. Armstrong, R. N. Graves, San Francisco; C. H. King, F. S. Cook, G. E. King, Berkeley; W. H. Worden, Oakland, directors.

## Recent Mining Dividends.

THE Silver King mine, Utah, paid a $37,000 dividend on the 7th.

THE Isabella Mining Company paid a dividend of 1c on the 25th.

THE Montana Ore Purchasing Company paid a bonus dividend of $1 per share on the 20th.

THE Homestake mine, South Dakota, paid its usual monthly dividend of 25c per share on the 25th.

THE Mercur, Utah, distributed a dividend of $25,000 among its stockholders on the 21st, a total of $425,000.

THE CALIFORNIA DEBRIS COMMISSION—having received applications to mine by the hydraulic process from A. J. McDonald, in the Kanaka Valley Mine, at Salmon Falls, El Dorado Co., to impound tailings in a ravine; from Paris Bean, in the Empire Hill Mine, in North-East Township, Yuba Co., to impound tailings in Empire Creek and in an old pit; from John J. Bailey, in the Badger Hill Mine, near Placerville, El Dorado Co., to impound tailings in a ravine; from B. Guidici, in the Grasshopper Hydraulic Mine, near Pleasant Valley, El Dorado Co, to impound tailings in a ravine; from Mrs. Amalie Hafner, in the Dark Ravine Mine, near Crescent Mills, Plumas Co., to impound tailings in Dark Ravine; from E. D. Hurd, in the Miners' Row Mine, near Michigan Bluff, Placer Co., to impound tailings in a ravine; from Alfred A. Ludwig and William Everest, in the Nellie Bly Mine, near Igo, Shasta Co., to impound tailings in a ravine; and from R. R. Gumbert, in the Duquesne Placer Mine, at the head of Poplar Creek, Plumas Co., to impound tailings in a ravine—gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on April 6, 1896, at 1:30 P. M.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR WEEK ENDING MARCH 17, 1896.

556,608—OILER—T. M. Anderson, New Whatcom, Wash.
556,571—LOG LOADER—Bateman & Lyda, Forest Grove, Or.
556,432—BICYCLE ALARM—L. D. Craig, S. F.
556,735—WATER FILTER—W. B. Farwell, S. F.
556,535—PUZZLE—C. M. Fitz, Oakland, Cal.
556,624—CAR WHEEL—C. W. Flint, Port Townsend, Wash.
556,667—GAS GOVERNOR—G. E. Ford, Golden Gate, Cal.
256,625—LOGGING JACK—J. E. Gilchrist, South Bend, Wash.
556,462—APPARATUS FOR STARTING RACES—A. Gray, New South Wales.
556,737—SADIRON—J. F. Hagerty, S. F.
556,528—HARNESS BUCKLE—S. P. Haney, Ione, Or.
556,466—CRUSHING MILL—F. A. Huntington, S. F.
556,652—PROJECTILE—L. A. Johnson, S. F.
556,583—HORSE POWER—T. F. Marquand, Florence, A. T.
556,434—ELEVATOR—J. Parkinson, Los Angeles, Cal.
556,435—ELEVATOR—Parkinson, Martin & Bowen, Los Angeles, Cal.
556,640—WHEEL BEARING—J. Pettinger, Santa Barbara, Cal.
556,375—FIREPROOF BUILDING—G. Rushforth, Stockton, Cal.
556,501—PHOTOGRAPHS—F. A. Taber, S. F.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

BICYCLE CLEANING STAND.—C. A. Wright, San Francisco, Cal. No. 556,076. Dated March 10, 1896. This invention relates to a means for supporting bicycles in a reverse position so that they may be conveniently cleaned. It consists of a framework having an adjustable saddle support at one end, and swivel clamps at the opposite end adapted to receive and lock the handle bars so that the machine, when inverted, is held firmly and can be easily cleaned or attended to. The device stands upon legs of suitable or convenient height, and is provided with a box for containing cleaning cloths, tools, etc., the whole being mounted upon castors so that it can be easily transferred from point to point.

APPARATUS FOR USE IN STARTING RACES.—Alexander Gray of Canterbury, N. S. W. No. 556,462. Dated March 17, 1896. This invention, as its name implies, is especially designed for use in starting horse races. It consists essentially of a barricade and means connected with the same for moving it in a straight line in an upwardly inclined direction ahead of and from the horses. The barricade itself is composed of two side frames from which wires, tapes or other suitable material, are stretched across the track. Tapes are preferred. Each side frame of the barricade is secured to or forms part of the sliding block that can be caused to slide rapidly up an inclined slide by any suitable means. The slides incline upward ahead of the horses, their lower ends being about 4 feet from the ground and their upper ends at an elevation sufficient to carry the barricade to such a height as to be clear of the jockeys' heads as they pass under. Each sliding block is held at its lower position by means of a trigger or other suitable contrivance and both triggers are arranged so that they can be operated simultaneously. Suitable contrivances are employed whereby a tension is produced upon the tapes of the barricade when at its lowest position.

CRUSHING MILL.—Frank A. Huntington, Oakland, Cal. No. 556,466. Dated March 17, 1896. This mill is one in which the rollers are mounted at an inclination upon an axes which are parallel with the plane of the inclined surface of the crushing die, and said rollers are adapted to move bodily to and from the die in a plane at right angles thereto whereby they crush and grind the ore with a force due to their weight and to centrifugal action, and held to accommodate themselves to inequalities and obstructions in the ore bed.

## A Good Belting.

Belting plays such an important part wherever machinery is used, that it behooves those who have to pay the bills to give the matter of its selection careful consideration, as to quality and general adaptability to the purposes for which it is intended. The leather belting manufactory of Fred R. Cook (successor to A. O. Cook & Son) at 208 Mission street, this city, is one of the oldest belting concerns in the West, having been established here now for about a quarter of a century. It selects its hides and does its own tanning, always with an eye to producing the toughest and most durable belt that can be made, rather than the lowest price. That every facility is at hand for turning out a good article will be apparent to those who visit the works. While belts of all descriptions are being made to order, there is still kept in stock a full line for filling quick orders—flat and round belts, rawhide, lace, leather, etc.

One who deals with the Fred R. Cook belting house once, whether by mail or in person, is very likely to continue its patron. *

Detachable chain belt, sprocket wheels, malleable and steel elevator buckets, elevating and conveying appliances.

# Assessment Notices.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, Cal. Location of works, Auburn Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 20th day of February, 1896, an assessment (No. 2 of 10 cents per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, 257 Twelfth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of April, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 30th day of April, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. WINTERS, Secretary.

Office, 257 Twelfth street, San Francisco, California. Office hours from 8 to 10 P. M.

---

CON. CALIFORNIA AND VIRGINIA MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 4th day of March, 1896, an assessment (No. 6), of 30 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on TUESDAY, the 28th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

---

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1896, an assessment (No. 5) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 4th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 56, No. 309 Montgomery street, San Francisco, California.

---

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees held on the twenty-fifth day of March, 1896, an assessment (No. 78) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth (28th) day of April, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED R. DURBROW, Secretary.

Office—Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

## DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 3) levied on the Tenth (10th) day of February, 1896, the several amounts set opposite the names of the respective shareholders as follows:

| Names. | No. Cert. | No. Shares. | Amt. |
|---|---|---|---|
| John E. Todd | 5 | 2,500 | $125 00 |
| John E. Todd | 6 | 2,500 | 125 00 |
| John E. Todd | 9 | 2,500 | 125 00 |
| John E. Todd | 55 | 2,500 | 125 00 |
| Wm. H. Caln | 7 | 2,500 | 125 00 |
| Wm. H. Caln | 8 | 2,500 | 125 00 |
| Chas. A. Moore | 102 | 7,222 | 361 10 |
| Chas. A. Moore, Trustee | 103 | 7,222 | 361 10 |
| Percy P. Moore | 117 | 6,000 | 300 00 |
| Percy P. Moore | 118 | 7,222 | 361 10 |
| Percy P. Moore, Trustee | 130 | 468 | 23 40 |
| E. C. Godfrey, Trustee | 160 | 6,667 | 333 35 |

| F. R. Harris | 43 | 1,000 | 50 00 |
| F. R. Harris | 44 | 1,000 | 50 00 |
| F. R. Harris | 45 | 1,000 | 50 00 |
| G. B. Libby | 83 | 2,000 | 100 00 |
| N. L. Bell, Trustee | 128 | 250 | 12 50 |
| A. U. Rugg | 16 | 1,000 | 50 00 |
| A. U. Rugg | 67 | 1,000 | 50 00 |
| Louise V. Rugg, Trustee | 149 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 150 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 151 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 152 | 5,000 | 250 00 |
| Louise V. Rugg, Trustee | 155 | 1,000 | 50 00 |
| Louise V. Rugg, Trustee | 156 | 1,000 | 50 00 |
| Louise V. Rugg, Trustee | 157 | 500 | 25 00 |
| Louise V. Rugg, Trustee | 158 | 2,500 | 125 00 |
| Louise V. Rugg, Trustee | 159 | 2,500 | 125 00 |
| W. B. Rugg | 109 | 5,000 | 250 00 |
| G. H. Ripley, Trustee | 120 | 400 | 20 00 |
| G. H. Ripley, Trustee | 121 | 200 | 10 00 |
| E. C. Godfrey, Trustee | 141 | 1,667 | 83 35 |
| E. C. Godfrey, Trustee | 142 | 3,000 | 150 00 |
| E. C. Godfrey | 133 | 3,193 | 159 75 |
| E. C. Godfrey | 134 | 4,000 | 200 00 |
| Jos. A. Pratt | 3 | 2,500 | 125 00 |
| Jos. A. Pratt | 54 | 2,500 | 125 00 |

And in accordance with law, and an order from the Board of Directors, made on the 10th day of February, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Nos. 37 and 38 Crocker Building, San Francisco, California, on FRIDAY, the 10th day of April, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, 37 and 38 Crocker Building, San Francisco, California.

## ASSAYER WANTS POSITION.

Young practical man about mine, mill, chlorination or cyanide works. Address "MOTHER LODE," care MINING AND SCIENTIFIC PRESS.

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**
**220 Market Street..... San Francisco, Cal.**

### *Assaying.—Part I—Gold and Silver Ores.*
Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price, postpaid.....$1 00

### *Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

### *Assayer's Guide.*
By Oscar M. Lieber.....$1 50

### *Assayer's Manual.*
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

### *Manual of Assaying—Gold, Silver, Copper and Lead Ores.*
By Walter Lee Brown, B. Sc. One colored plate; 152 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

### *Notes on Assaying and Assay Schemes.*
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

### *Blowpipe Analysis—Manual and Qualitative.*
By F. M. Endlich.....$4 00

### *A Practical Guide for Prospectors and Miners.*
By C. W. Moore. With numerous illustrations.....$4 75

### *The Explorer's and Assayers' Companion.*
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

### *Aaron's Leaching Gold and Silver Ores.*
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

### *Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

### *The Lixiviation of Silver Ores with Hyposulphite Solutions.*
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

### *Modern Copper Smelting.*
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

### *The Metallurgy of Gold.*
By M. Eissler. Profusely illustrated.....$5 00

### *Losses in Gold Amalgamation.*
By W. McDermott and P. W. Duffield.....$2 00

### *Electricity in Mining.*
By Sylvanus P. Thompson.....80 cts.

### *Practical Treatise on Hydraulic Mining.*
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, postpaid.....$5 00

### *Practical Hydraulics.*
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

### *Hydraulic Gold Miner's Manual.*
By T. S. G. Kirkpatrick. With plates and cuts.....$2 25

### *Manual of Hydraulic Mining for the Use of the Practical Miner.*
By T. E. Van Wagenan.....$1 00

### *The Sampling and Measurement of Ore Bodies in Mine Examinations.*
Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

### *Manual of Mining.*
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages. 8vo., cloth.....$4 00

### *A Text Book of Mineralogy.*
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

### *Manual of Determinative Mineralogy.*
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

### *Metallurgy of Silver, Gold and Mercury in the United States.*
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and fo ding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 50

### *Metallurgy of Silver, Gold and Mercury—Continued.*
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

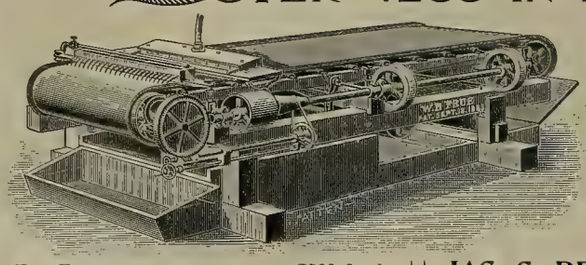
### *Notes on the Treatment of Gold Ores.*
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

### *A Practical Manual of Minerals, Mines and Mining.*
By H. S. Osborn.....$4 50

### *Matte Smelting—Its Principles and Later Developments, with an Account of the Pyritic Processes.*
By Herbert Lang.....$2 00

### *Cyanide Processes for Gold and Silver Ores.*
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

### *Practical Metallurgy and Assaying.*
By A. H. Hiorns.....$1 50



### *The Practical Metal Worker's Assistant.*
By Oliver Byrne. Illustrated.....$5 00

### *Quartz Operator's Handbook.*
By P. M. Randall.....$2 00

# FRUE ORE CONCENTRATOR.

OVER 4200 IN ACTUAL USE.

Manufactured under Patents of
April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.

## The Hydraulic Gravel Elevator.

Much interest is now being taken by miners all over the coast, more especially southern Oregon, Idaho, Washington and British Columbia, concerning the hydraulic gravel elevator, and weekly inquiry is received concerning this appliance of hydraulic mining. While this modern system of working gravel deposits where the natural gradient is insufficient has been used in this State in a number of places for several years, it seems little known to the mining fraternity generally. It is accordingly deemed of sufficient importance to deserve illustrated notice. Our illustrations on this page are from recent photographs of operations at North Bloomfield, Nevada county, this State. Fig. 1 portrays the familiar California scene of a giant playing against the bank. Fig. 2 illustrates a hydraulic elevator in operation. Ordinarily in that location the tunnel depicted in the engraving is used. But in accordance with the mandate of the U. S. Debris Commission that tunnel is in disuse. The waste material flows down through the channel depicted in the foreground of Fig. 2, and is there shot up through the elevator into the dam, there to be impounded.

FIG. 1.—HYDRAULIC GIANT IN OPERATION.

The history of the hydraulic gravel elevator began in this State in 1880, and its first introduction was by the Yreka Creek Gold Mining Co. at Yreka creek in Siskiyou county. The pattern was the Cranston patent. The gravel was elevated there about 40 feet, the pressure used was 266 feet, about 800 inches of water was used on the elevator, and two giants piped the gravel to the elevator, using two and one-half and three nozzles. This worked well, but the supply of water was not sufficient to run it steadily without reserving, which made it unprofitable, and work, after two years, was stopped. At McGilvery's, on the Trinity river, in Trinity county, an elevator was used in working a low bar in 1881, the upcast being a wooden box lined with blocks. Made in the style of a sluice, with the top side open and placed on an angle of about 30°, this worked very well where the gravel had only to be elevated a short distance. The same kind of a contrivance was used at Oro Fino, Siskiyou county, by the Eastlick Bros., which was simply a nozzle placed at the lower end of an open sluice, paved with blocks and placed at an angle of 30° or 35°, which acted as a force pump and carried the water and material out of the pit. These crude appliances have been done away with, as it was found to be impracticable when much depth was reached.

FIG. 2.—HYDRAULIC ELEVATOR AT NORTH BLOOMFIELD.

About this time J. H. Martin, a practical miner of Oroville, Butte county, secured a patent on an elevator similar to the Cranston pattern. The Joshua Hendy Machine Works of this city being the owners of the Cranston elevator, secured the Martin and improved upon them both by building one of their own, though they built the Martin pattern when desired. The Miocene mine at Thompson's Flat, near Oroville, was the first to use the Martin elevator, the purpose being to elevate the tailings to a place for impounding, but it was found to be impossible to keep the tailings from getting into the Feather river, and they were enjoined. At the Miocene 1000 inches of water, with a 6-inch nozzle and 300 feet pressure, was used in a 20-inch upcast. The gravel was raised 30 feet, but the pressure here was too great for the height, which made it very difficult to get anything to stand at the top, where the stream was broken down to enter the outer sluice.

R. H. Campbell used a Martin elevator at his Quartz Valley mine for five years, and experimented perhaps more with elevators than any other person in the State. At his mine 1000 inches under 240 feet pressure was used through a 6-inch nozzle and a 20-inch upcast, elevating the gravel and water from two giants, which used 700 inches of water, to a height of 41 feet. This was perhaps the best adjusted plant used, and gave satisfaction, running continuously night and day for four and five months of each year, with very little repairs.

In 1889 the Joshua Hendy Machine Works contracted to erect one of their hydraulic gravel elevator plants at the North Bloomfield for elevating the gravel 96 feet and depositing in the old excavated pit, there to be impounded. This was successfully done with 1500 inches of water under 540 feet pressure, discharged through a 6-inch nozzle into a 20-inch upcast 113 feet long and delivering the material into an upper discharge sluice at a vertical height of 96 feet, from a large giant that was using 800 inches of water against the bank. The only difficulty in operating this plant was caused from the great amount of friction or wear and tear at the throat of the machine where the gravel entered. Considerable experimenting was done which demonstrated the fact that under proper conditions the gravel elevator can be used very effectually and at nominal cost. It is only a matter of time when they will come into general use where natural grade for carrying away the debris is absent and the water under pressure is obtainable.

The question is asked, How much gravel can be elevated in a day with an elevator? which, in general, is as easy to answer as the question, How much can one haul with a team? without stating the number of horses to be used or the kind of a road it is to be hauled over. A hydraulic gravel elevator must be fitted to the conditions, and in order to obtain proper information concerning them the miner should state the height the gravel is to be elevated

(Continued on page 265.)

# MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

*Office, No. 220 Market Street, Northeast Corner Front, San Francisco*
*Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

San Francisco, April 4, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Hydraulic Giant in Operation; Hydraulic Elevator at North Bloomfield, 261. R. H. Campbell's Duplex Hydraulic Gravel Elevator; Eco Magneto Watchman's Clock, 265. Rand Compressor in the Atchison, Topeka and Santa Fe Shops; Rand Compressor for the Chicago and Northwestern Railway, Showing Details of Engine and Intercooler, 266. The "Racycle" Narrow-Tread Crank Hanger, 267.

EDITORIAL.—The Hydraulic Gravel Elevator, 261-265. Tailings to be Reworked by New and Improved Processes; Separation of Gold from Black Sand; The Lead Ore Bill; Proceeds of Patented Mineral Lands; Decision in the Spring Valley Mine Case; The Reorganization of the U. S. Debris Commission Complete; The California State Mining Bureau; The Necessity of United and Harmonious Efforts, 262.

MECHANICAL PROGRESS.—Air Compressors for Railway Use, 266. The "Racycle" Narrow-Tread Crank Hanger, 267.

ELECTRICAL PROGRESS.—Some Notes on Dynamometers, 267.

SCIENTIFIC PROGRESS.—Tendency to Return to the Old "Vitalistic" Theory of Living Matter, 267. New "X" Rays Discovered; The Law of Distribution of Light, 268.

PRACTICAL INFORMATION.—Method for the Separation of Tellurium from Copper Residues; A Bill to Construct Cruisers After the Painton Design; An Electric Pocket Lamp, 269.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 270-71.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 278.

MISCELLANEOUS.—Concentrates, 263. "Invention"—The Indefinable Requirement of the Patent Law; Marketing California Produce. 264. Eco Magneto Watchman's Clock; The Assay of Silver Sulphides, 265. Additions to the State Mining Bureau; Recent Patents; Washington State Incorporations, 271. Coast Industrial Notes; Personal; Commercial Paragraphs; Literary Note; Recent Mining Dividends; Recent Mining Incorporations, 272.

At several points in this State and Nevada lie accumulated heaps of tailings which it is proposed to work over at probable profit by new and improved processes. The fact that this can be done need reflect no discredit on the original workers. In their day and generation doubtless they did the best they could. In many instances, too, it didn't pay to work the ore too close. To expend additionally $1.25 in getting 75 cents return was poor economy. Concentrators, chlorination, cyanide, etc., have now reached that stage of perfection that enables former waste to be handled at a small profit, and in many instances a modest revenue is thus afforded.

The letters weekly received at this office from various sections regarding black sand, and the best methods of gold separation therefrom, illustrate the widespread interest in that form of gold gangue, and the absence of any device that comes up to general expectation. So far as our observation and experience go, the many new processes and inventions are not satisfactory to the practical miner. Those who report the best success use the old-fashioned corrugated plates with mercury. Inventors and projectors of machines to save free gold from black sand, though invariably sincere in their beliefs, often find considerable difference in the degree of success attained in experiments with samples, and the actual work on the ocean beach and elsewhere in situ.

The reorganization of the U. S. Debris Commission is complete, and the new members have begun the work. It is a thankless duty delegated to these gentlemen, as it is simply additional work which devolves upon them without any additional pay. Reference is here made to the commission merely to remind certain gentlemen who imagine that they are in some authority therein that this whole matter of hydraulic mining where any of the resultant debris may find its way into any tributary of a navigable State river, is in the hands and under the authority of the U. S. Debris Commission; that the members of that commission are thoroughly impartial—they care nothing for the barkings of biased newspapers nor the complaints of individuals who hope for continued profit by continuous contention. It is their province and their purpose to administer the law as they find it in the act creating the commission. This they have done and are doing; this is all the miners ask or expect; it should be all that the anti-debris people can reasonably look for. To create discord or continue injustice is not the aim of the commission, nor is it the honest wish of the miners and farmers who are equally interested in the just solution of this question, a question that can only be settled by unity of purpose and sincerity of motive on both sides.

The bill providing that 25 per cent of the proceeds of patented mineral lands shall be given to the several States in which the land so sold is situated, for their mining schools, is in a fair way to become a law. It will be a good thing for several deserving institutions. The mining school at Houghton, Michigan, is supported by the State; the one at Golden, Colorado, is similarly endowed. The passage of the bill encourages Montana to go on with projected work in that direction. In this State the admirable mining department of the State University at Berkeley will doubtless be a beneficiary of the fund. A recent visit to that school shows a degree of practical proficiency and detail that is only retarded from further excellence by a lack of funds. The University regents concede the advisability of increased expenditure, but cannot supply the money. Any addition from any source would be of immediate benefit. The amount accruing will, however, be comparatively trifling, and should be but supplementary to a main addition from State sources.

The lead ore bill has passed the House and receives favorable consideration in the Senate. It provides for the establishment of Government sampling works at El Paso, Texas; Northport, Washington, and Bonner's Ferry, Idaho, and at such other ports as the Secretary of the Treasury may designate. The bill also provides that "in no instance shall a less portion than one-fifth of any importation of ores be sampled and assayed." When ores are imported at ports at which no Government sampling facilities are provided, the importer is required to send one-fifth to the Government sampling works under direction of Government officials. In the opinion of the framers of the bill, if it become a law, it will be impossible to import lead ores except at points where these works are established, and that, with the requirement that a minimum of at least one-fifth of the importation shall be sampled and assayed, the duty levied on lead ore will be honestly and faithfully collected. If so, the lead producers will enjoy some degree of protection.

A decision was reached last week in the case of the Spring Valley mine at Cherokee Flat, Butte Co., Judge Prewitt of Placer Co., in the Court of Equity, deciding against the Bank of California and Rideout & Smith, and in favor of the bondholders. The case is a notable one. The mine has yielded over $12,000,000 gold, and the suit has been going on for eight years, petition for foreclosure of the bonds having been filed in '88. A New York corporation, the owner of the mine, issued the bonds. Some time after the company was reincorporated under the laws of this State. Suit for foreclosure of a mortgage resulted in the intervention of the Bank of California of this city and Rideout & Smith, bankers at Marysville, who had become possessed of the property, and who set up technical defense in opposition to payment of the bonds issued by their predecessors, whose rights they had assumed. That question was decided by the Supreme Court in favor of the bondholders. Then the statute of limitations was set up, this plea now being set aside by Judge Prewitt, who gives judgment for the plaintiffs against the Spring Valley Gold Co. for $151,000 principal and $129,759 interest, and orders that the receiver in charge shall advertise the sale of the mine.

In last week's issue appeared a deserved tribute to the practical value and usefulness of the California State Mining Bureau, written by an old miner. To his remarks it is in order to add that much of the material benefit resultant from the practical operation of the Bureau is due to the efficiency of State Mineralogist J. J. Crawford, who directs the work. Beyond unavoidable delay in securing statistics, arising from circumstances outside of his control, the prompt business character of the work, its practical nature, and the general management of the office, have been in the highest degree satisfactory to the miners and that part of the general public interested in the mining industry. The unprecedented demand from all parts of the mining world for the Bureau's publications show the value of the information secured by Mr. Crawford's assistants in the field and the specialists delegated by him to prepare up-to-date information. The Bureau is an institution wherein party politics should not enter, and in just recognition of this fact the present State administration made no determined effort to change. Mr. Crawford's term of office will expire in about eleven months. The fact that the chief executive of the State is of a different political persuasion, coupled with Mr. Crawford's disinclination to further sacrifice his private interests to the public good, make it unlikely that he will continue in charge after March, '97. The office is not a political gift; it can be secured only upon examination and demonstration of practical fitness, and needs the constant supervision and the combination of technical knowledge and business judgment that the present incumbent has exercised. There are already several applicants or aspirants. The matter is not one of favor, but fitness. The result of the Bureau's work is constantly dependent on its head, and if he be competent and zealous the State is greatly benefited thereby.

As exclusively announced in these columns two weeks ago, the united and harmonious efforts of California's congressional representation has succeeded in having placed in the River and Harbor bill an appropriation of $250,000 for restraining works at Deguerre Point on the Yuba river. This is mainly due to the fact that California representatives made no objection. Apart from the merits of the measure, the unanimity of expressed opinion was so in favor of the appropriation that, despite the fact that Speaker Reed had denied to California representation on the committee, the appropriation was made. Nothing more clearly illustrates the value of unanimity in affairs of this kind, unless it be an illustration afforded this week in the case of southern California harbor appropriations. By hard work $490,000 appropriation had been secured for the improvement of San Pedro and Santa Monica harbors, both seaports for Los Angeles. Then virulent opposition developed, each rival interest saying hard things of the other. The result is that both were believed, two appropriations stricken out and southern California gets—nothing. This is a matter of regret, but exemplifies the usual result of wrangling. This paper does not more than briefly refer to the matter; it fully understands the minutiæ of the case and the railroad complications and the fact that Santa Monica is a pet Southern Pacific project, while San Pedro is the choice of Los Angeles. Recurring to the debris dam appropriation, it is in order to repeat for the benefit of some implacable anti-debris people what has been before pointed out: the $250,000 now to be appropriated by the U. S. Government will unlock the contingent $250,000 already appropriated by the State for the same purpose. That makes half a million dollars for the construction of a debris dam. This structure is not for the impounding of fresh debris or for miners to use as a tailings dump, as is claimed by those who won't see otherwise. It is to stop the seaward movement of detritus mined twenty years ago. Every hydraulic miner in the region affected will have to work under the operations of the Caminetti law, just the same as though the appropriation had not been made. Hydraulic miners must continue to build their own dams and take care of their debris. The public money is to be applied solely for the public benefit—mainly to the aid of the valley dwellers who have so persistently opposed it. The magnanimity of the miners and the sober good sense of the nation's representatives have succeeded in showing Congress that the right way to go about this great work is to take the thrice repeated advice of the Government engineers appointed to inquire into and report on this matter, and begin by impounding debris that has been accumulating since mining began in California. The Mining and Scientific Press is in receipt of an irate communication stating intention to enjoin the State from paying out the $250,000 appropriation made by the California legislature, on the ground that it "is unconstitutional." The writer says he "will not be made a fool of." He is quite right; no one can make a fool of him, nature having denied any one the opportunity. Meanwhile, his attention is commended to the result of the southern California quarrel as briefly referred to herein.

## Concentrates.

THE De Lamar, Nevada, mine, is now yielding $45,000 monthly.

LIGHT SNOWFALL in the mountains this season is the general report received.

THE formal opening of the Gold Mining Exchange will be at 11 A. M., April 6th.

A TELEPHONE line is to be run from Auburn, Placer Co., to Georgetown, El Dorado Co.

MINAS PRIETAS, Sonora, Mexico, is now credited with a monthly gold output of $300,000.

THE Anaconda, Montana, Co. is credited with a production of 12,000,000 pounds of copper in March.

MANAGER COHEN, of the Golden Gate, Mercur, Utah, is about to contract for a mill of 500 tons daily capacity.

SALT LAKE, Utah, men are acquiring valuable holdings on the mother lode in Calaveras and Tuolumne counties.

AT the Niagara mine, Shasta Co., Supt. Henley is adding to the force of men. The mill will be started this week.

URANIUM has been found at Carbonate camp, S. D. It is an emerald-hued ore, and refined, is worth $2.40 per pound.

THE Horn Silver Co., Utah, contemplates increasing its thirty stamps to sixty, by reason of increased water flow.

D. COFLIN has bonded the Canada Hill Con. mines in Nevada Co., Cal., and with sufficient capital can secure good returns.

THE Cornwall Miners' Distress Fund, of Camborne, England, is appealing to Cornish miners employed in this country for aid.

THE March coinage of the San Francisco Mint aggregated gold, double eagles, 77,000, $1,540,000; standard silver dollars, 100,000.

TO OBVIATE confusion, it is in order to say that the name of Kootenay, B. C., is spelled as herein. Kootenai, Idaho, ends with an "i."

"HOW LONG will it be," asks the London *Echo*, "before the yellow man with white metal gets away with the white man with the yellow metal?"

AT Empire, Colo., miners' wages are $3 per day. The local paper says: "Tenderfeet are hired for $2.50 by some who are trying to make $2.50 standard wages."

NEXT Saturday's issue of this paper will contain twenty-four pages. There will be an extra 10,000 edition—that is, 10,000 extra in addition to the usual number.

"MINE TIMBERING," one of the valuable publications issued by the State Mining Bureau, and which is out of print, will shortly be reissued, rewritten and profusely illustrated.

MAINLY at the request of some mine and smelter employes, Utah's Legislature has enacted a law making eight hours a day's work, which other miners and smelter employes ask the Governor to veto.

UTAH MINERS who have secured access to the Uintah reservation, report rich gold, silver and copper ore therein, and declare that when the reservation is thrown open some big mines will be opened.

FROM the *Smelter*, a merry little monthly just begun at Keswick, Shasta Co., Cal., it is learned that the name of that new town, the headquarters of the Mountain Mines Co., Ltd., is pronounced "Kezzick."

THERE is considerable stir at the new State Line mining district, partly in Utah and partly in Nevada. Daily reports are received of strikes, and the new road projected from Salt Lake adds to the prospective value of the locality.

MESSRS. FALKENBERG, BLISS AND KENNY, the new owners of the Lone Jack mine, Little Tahunga canyon, Los Angeles county, have considerable $5 ore and will build a sixty-stamp mill, the largest concern of the kind in the county.

J. MARCHANT, late assistant manager of the Holcomb Valley G. M. Co., claims to have found at Manvel, San Bernardino Co., some very rich gold ore. He proposes to start for London and organize a company to work the mines.

COLORADO MEN are investing in California gold properties and California men are investing in Colorado gold properties. Mining men pay very little regard to State lines, and little newspaper capital can be made out of such investments.

TWENTY-TWO CARLOADS of silver-lead ore have arrived at Pueblo, Col., from British Columbia. The silver ore is admitted free of duty; the charges for the lead amount in this case to $3000. The ore averages ninety-five ounces to the ton, sixty per cent lead.

AT Moscow, Idaho, E. E. Rogers, manager of the Silver White Mica Mining Company, has bonded the Last Chance and is driving tunnels so that a large force can be put at work in the next sixty days. He is about to buy an electrical plant and hoisting works.

THE secretary of the newly organized British Columbia Miners' Association writes the MINING AND SCIENTIFIC PRESS for a copy of the constitution of the California Miners' Association, which is being taken as a guide and model by several similar associations elsewhere.

THE railroad from Trail Landing to Rossland, B. C., will be in operation by the 1st prox. The objective point of the road is Penticton, West Kootenay. The road will be about 180 miles long, will cost $30,000 per mile, and is expected to be completed in about three years.

LIKE the Hale & Norcross, a fight will be made for the control of the Bulwer Consolidated, a Bodie, Cal., mine, at the annual election. New York men, who own 25,000 shares—about one-quarter of the mine—claim extravagant management and want to cut down salaries, etc.

THE recent article in this journal, "Mine Development the Basis of Prosperity," by A. B. Paul, which attracted so much attention, has been reprinted in pamphlet form by the author, and will be sent to any address on request. Address A. B. Paul, 49 Crocker building, San Francisco.

THE Spokane *Chronicle* says the Poorman-Tiger Consolidated (Idaho) Company is taking active steps to rebuild the compressors that were destroyed by fire about two weeks ago. Instead, however, of building two mills it is the intention of the company to put the plant under one roof, to be of about 400 tons capacity per day. It is hardly expected that the mines can start up in full blast again before Aug. 1. At present there are only fifteen miners at work.

J. B. TONKIN, now superintendent of the Iron Mountain mine of Shasta county, says the mine is being worked with great success, shipping 100 tons a day to the smelting works. Private letters from there say there is considerable difficulty and delay. Those in charge are reticent regarding operations.

"THE biggest gold mine in the country" is still being numerously reported from several localities. Meanwhile two or three California properties—the Utica, in Calaveras, the Rawhide, in Tuolumne, the Kennedy, in Amador—monthly turn out hundreds of thousands of dollars, with very little being said about it.

COMMISSIONER OF THE LAND OFFICE LAMOUREUX has finally made a decision that can be endorsed by the miners. He officially announces that "marble is a mineral." Those who have heretofore held to the opinion that marble was a vegetable or an animal should feel ashamed of themselves now that the Commissioner has spoken.

SECRETARY OF THE INTERIOR SMITH, in the case of a protest against the application for patent for placer claim at Gibbonsville, Idaho, has decided in favor of the townsite. This placer, as located, embraced about half of the town of Gibbonsville, and was evidently only located for speculative purposes. This contest was commenced in the Hailey land office three years ago.

IN the case of the S. P. R. R. vs. W. C. Burton, G. W. King et al., to determine the character of certain lands in the White River mining district, which came to trial before Register Patrick of the U. S. Land Office at Visalia last Tuesday, a decision was rendered in favor of the defendants on the grounds that the lands were more valuable for mineral than for agricultural purposes.

IN addition to the $250,000 in the regular River and Harbor bill for the De Guerre point restraining barrier, a Commission to be known as the Sacramento River Commission will be created by Congress, consisting of Federal engineers, whose duty it will be to take charge of the Sacramento river and its navigable tributaries, and restore them so far as possible to the conditions existing thirty years ago.

THE Alaska steamer brings the usual story of "big gold finds." The Alaska transportation companies are working the thing for all it is worth, but it is evident that much misery and suffering will result. Apart from ordinary privation and disappointment, thousands of deluded men rushing north will be in positive danger of starvation. Unless well equipped with money and physically fit to stand exposure and hardship, no one should contemplate the trip.

THIS week the Supreme Court of this State decided that "sections 1 and 2 of the act approved March 31, 1891, entitled 'An act to provide for the payment of the wages of mechanics and laborers employed by corporations,' do not apply to all corporations, but only to those who, while doing business in the State of California, employ laborers and mechanics by the week or month, whose wages, under the terms of their employment, are paid weekly or monthly."

A STATE STATUTE prescribes it to be the duty of every mine superintendent to file weekly and monthly accounts and reports, verified under oath, showing receipts, disbursements, number of employees, and wages paid, reports to be kept in the office of the company, open to inspection of the stockholders and provides that in case of the failure of the directors to have the reports and accounts made and posted as provided, shall be liable to an action by any stockholder, who on proof of the failure shall recover judgment for $1,000 liquidated damages.

SINCE the President's pious strictures on Pacific coast godlessness reform is evident, and Mr. Cleveland will doubtless be delighted that his solicitude for souls has been effective. Already all Sunday work on the Comstock in Nevada has been discontinued, and now the Boston & Montana Company announces that no more mining will be done on Sunday in that corporation's Montana mines. It is hoped, however, that the new religious zeal, though commendable, will not go to the extent of dispensing with necessary pumping work, as the laws of nature are not suspended on the first day of the week.

GEO. V. NORTHEY is securing machinery to work the quicksilver deposit at the Manzanita mine, near Sulphur Creek, Colusa Co. This is the mine that the land officials concluded was "agricultural land," and ordered an agricultural patent issued therefor, despite the fact that a Government official—Dr. Becker, the eminent geologist—made special report thereon, and pointed out its peculiarity as being both a gold mine and a quicksilver mine. But a little fact like that didn't stop the astute land officials in deciding it was not a mine. It continues to yield precious metals, as it has for nearly twenty years.

COMMISSIONER FITZGERALD is of the opinion that deserving men in need of employment could and should go to the mountain counties and work placer mines. The idea is an excellent one. But before starting them the commissioner should adopt some means of educating them, and then provide them with the facilities to make the necessary financial arrangements. A penniless man, unacquainted with the work, would have no chance whatever, no matter how willing he might be. To send such a man to where placer mines are would result in a remonstrance from the county authorities, who would ultimately have to give the poor fellows food and shelter.

THE *Democrat* says the stockholders of the Oregon Gold Mining Company of Louisville, Ky., whose properties were located at Cornucopia, in the eastern part of Union county, and which were recently sold under execution for $9000, although the judgment was for over $300,000, have deeded their interest in the properties to John Dorhofer, as trustee, who has commenced proceedings to redeem. The amount required to do this is $16,784.60, which has been paid into court. The properties were redeemed some time ago by J. R. Farrell of Cornucopia, who had a subsequent judgment against them, but the Louisville people claim this redemption is invalid.

ASSAYERS are the common butt in all mining camps, says the Arizona *Republican*. That's so. And, as a rule, they "get it in the neck" unreservedly. For example, every one remembers that story of Mark Twain's, how the boys up in Utah got hold of a chunk of a Mormon's grindstone and worked it off on the camp assayer. He got an assay of $300 to the ton in silver out of that grindstone and the boys ran him out of camp. That was a true story, and yet that assayer was all right. In the early days the Mormons used to cut their grindstones out of what afterwards was known the world over as Silver Cliff. That cliff was a sand carbonate, and eventually it was discovered to be a wonderful deposit of silver ore. But that was too late to help the poor devil of an assayer who sampled the grindstone.

THE "battery" assay, "car samples," etc., of the Comstock are no more satisfactory than similar discrepancies elsewhere. W. S. Stratton, the Colorado millionaire mine owner, is better situated in this regard than Comstock shareholders, as he is the individual owner of his properties which he absolutely controls. Growing tired of the continual difference between the reports of his assayers and the smelter returns, he has shut down everything that he owns in the shape of a mine, and proposes to resume only when he can handle his own ore from the time it is taken out till the product goes to the mint. He will build reduction works of his own, and under the new system will have the satisfaction of knowing whether up to the present time he has been treated justly by those who have had the reduction of his ores. The present shut-down affects nearly 500 employes, most of whom will, however, find employment under the new regime.

A CHICAGO dispatch of the first says the iron and steel industry is now in the absolute control of a few men who are banded together by the strongest bonds of common interest, and who have, at a conservative estimate, not less than $300,000,000 at their disposal. The steel rail pool fixed a price of $28 a ton on steel rails at Pittsburg, and all other mills sold at the same price, with the freight from Pittsburg added. This meant that the Illinois Steel Company could ask $29 and the Colorado Fuel and Iron Company $33. The mill that could name the lowest freight rate took all intermediate sales. The new pool makes a price of $20 a ton on steel billets at Pittsburg, which is $3 over its former prices. All Western sales agents have been notified of the advance, and also have been notified to guarantee no sales for later than April delivery.

CONCERNING the progress of Oregon in selecting lieu lands, State Land Agent Davenport says "the State is practically shut out of the so-called mineral belt, and unless a modification of the rule can be obtained, there will hereafter be no sales of lieu land by the State within six miles of a mining claim." The ruling referred to requires the State to send a special agent to examine and certify to the character and pay for the advertising of each selection. The cost thus incurred, Mr. Davenport says, for small tracts, is such as neither State nor applicants can afford, and therefore renders the selections prohibitive on the part of this State, and that the Oregon delegation in Congress will be called upon to secure, if possible, such changes as will promote the objects of the Interior Department and permit the State to go on, as heretofore, selecting non-mineral lieu land without, in effect, having levied a tax too onerous to be borne.

THE Hallidie ropeway at Nelson, B. C., has so far delivered 5000 tons of ore. For the week ending March 21st 757 tons were smelted, yielding 30,000 ounces silver. It is the intention of dividing the ropeway into two sections, the upper section covering the deep snow belts, where snow falls from 8 to 16 feet, terminating on a plateau, where ore bins are being erected for the storage of ore; and on this upper section it is proposed to run at opportunities during winter and accumulate the ore, to be delivered in regular quantities to the ore bins at the smelter over the lower section of the ropeway. The upper section will be 2 miles long and the lower section, 2¼ miles, will be comparatively free from deep snow. At the upper end of this ropeway the temperature falls occasionally to 20° below zero. We illustrated this ropeway in our issue of February 1st, 1896. It is about 4¼ miles long, passing over a very rugged country and having a difference in level of the two ends of 4100 feet.

RECENTLY "Concentrates" noticed a statement of Congressman Hyde of the State of Washington, who was credited with intention of having an amendment to the California Mineral Land bill, making its provisions applicable to Washington. The comment was that that would kill the bill and prevent any similar legislation for Washington. The Spokane *Review* objects and thinks that is "a threat," and which "shows a narrow and sectional spirit." It was not so intended, and cannot in justice be so interpreted. What was stated is the exact fact, viz., that the amendments of the character proposed are precisely what the opponents of the bill rely upon to kill it and that once killed any similar attempt at legislation for Washington would meet the same fate at the hands of the common enemy. The *Review* is looked upon in this fight as a friend of the miner and sincere in its advocacy of popular rights, but if it is inimical to such legislation it would be more manly to openly assail it or endeavor to give some reason for opposition than to decry and misconstrue this journal's efforts to secure requisite mining legislation for the coast, in an apparent effort to arouse the very spirit that it ostensibly condemns, and which it is the first to invoke. If the *Review* is sincere it should turn its attention to the enemies of the measure and not attack its best friends.

FROM three different sources this week,—Tombstone, Arizona, Grant's Pass, Or., and Gottville, Shasta Co., is received almost exactly the same response in reply to inquiry addressed residents regarding mineral deposits concerning which information had been originally requested from this office, viz: "the prospector seems afraid some one is going to get his claim away from him and refuses to give any information." It is little use to write to this office announcing in general the discovery of metals (as in these cases of nickel, bismuth and tellurium) and when an attempt is made to get some definite information so that intelligent response of some practical value can be given, to decline any satisfactory answer to the journal's representative. Almost invariably, however, the value and extent of those finds is imaginative. In the case of bismuth, while it is true that it brings $2 per pound, yet fifty tons would flood the market, and twice that quantity at one time would bring the price down to twenty-five cents. So with tellurium: a few pounds of its domestic production would send the price down. Nickel is known to exist at Lovelocks, Nev., and Riddles, Or.; it is difficult to produce commercially, at a profit. But to ask for information and then refuse to give requisite data on which to correctly base an answer is on a par with the lady who wished to send a telegram, but refused to tell the operator what she wanted sent, maintaining that it was none of his business.

## "Invention"---The Indefinable Requirement of the Patent Law.

By W. H. SMYTH, Mechanical Expert and Consulting Engineer, Berkeley, Cal.

The subject of a patent must be not only new and useful, but *must* also be an *invention.*

The courts hold that an improvement is not patentable, if there is no *invention.*

With regard to the first two requirements but little difficulty has been experienced, or is to be anticipated; they relate to matters of fact and evidence. Questions involving them would be decided on the ordinary rules which apply to such matters.

A thing must be considered new if no similar coordination of mechanical or other elements is on record.

So, too, if it does not appear that a device is hurtful, it may for the purposes of the patent law be considered useful. Contrivances which are absolutely negative and inert are sufficiently rare to be left out of consideration; besides, a more positive or active interpretation of this word must presuppose not only a universal range of information, but prophetic insight on the part of those whose duty it is to determine the issue. Further, the patenting of such devices, did they exist, could work no more serious injury than the encumbering of the records.

With regard to the third requirement, a very different state of things presents itself.

It is my intention to show that though the third requirement has always been in the statute, and its meaning substantially the same as the present interpretation, until recently it has practically been a dead letter.

Further, that it is not by any means axiomatic that the third requirement is in any case *possible* of *fulfillment*, but, on the contrary, there are many cogent reasons for questioning whether "invention," like "spontaneous generation," is not a metaphysical myth.

That, even if it be in fact a real quality, *it has never been defined;* nor is it of such a character that its presence can in any case be determined beyond doubt. All authorities agree that "questions of invention proceed upon fine and subtle metaphysical distinctions."

Strangest of all, the law and practice relating to patents, which provides this requirement involving metaphysical distinctions, also provides that decisions relative to these philosophical subtleties shall be rendered by mechanics, chemists, lawyers, etc., but never by expert metaphysicians.

That in effect the Patent Office examiners and judges decide these questions arbitrarily. So the third requirement works injustice in all cases, but particularly in those involving the results of the highest and best form of mental industry, which the patent law was particularly designed to foster.

And that it should be removed from the statute and the idea eliminated from the practice both in the Patent Office and courts.

The phrases descriptive of invention used by the courts are very few, viz: "Inventive genius," "the genius of an inventor," "the inventive faculty," "invention as distinguished from mechanical skill," "invention as distinguished from construction," "ingenuity as contrasted with the judgment of a skilled workman."

These, of course, are not definitions, but simply phrases supposed to be descriptive.

Though the term "invention" has never been defined legally or otherwise, either as a mental process or product, attempts to describe it have not been lacking.

The following will, I think, suffice to show the inextricable confusion and difficulty arising from these attempts.

I quote from Merwin's "Patentability of Inventions," a good authority, though on this point one is as good as another, each being simply a summary of legal decisions:

"An idea is not an invention if it be in the nature of an inference. It is true, of course, that what is plain inference to one man is a sealed book to another. But the inference here spoken of is that which is natural to a man of ordinary intellect, possessing the ordinary skill and knowledge of the art in respect to the inference drawn." This is under the head of "Test of Invention," page 18. Would not such a test simply shift the inquiry from the invention to the inventor? Then, too, the most striking characteristic of mens' minds is the vast difference between them in this very matter of drawing inferences. This it is which makes the difference between the thousand-a-year and the thousand-a-month man.

Again (page 22) "*Invention is imagination*, it is the very *opposite* of *reason* or inference * * * * It is not a sort of elevated reason, it is a faculty, which differs in *kind* from reason, which often in truth is free to act only when reason has been thrust aside, and its conclusions ignored, nay, denied."

Certainly this is to the point, and ought to serve as a guide, but later we come upon this:—

"* * * * * in the last analysis reasoning and imagination are *both* perception of likeness, and reasoning *shades off into* imagination."

Here is another suggestion:—

"* * * * when the mind invents, it starts with the conclusion. The conclusion flashes, so to say, upon the mind * * * * an instance is the case of the barbed wire fence."

This does not appeal to the mind as axiomatic or even beyond question, nor does the illustration necessarily fit the stated conditions.

Is it not much more easy to think of the "barbed wire" as the result of inference from direct or reminiscent observation, than as a conclusion flashed upon the mind, out of nothing as it were?

Let us suppose a case:—

A man is walking through the woods searching for his cattle which have broken through the plain wire fence of their paddock. Suddenly he is brought forcibly, painfully, to a halt by an aggressive blackberry bramble which has grown across the path and attached itself to a tree.

Is it, I ask, necessary to endow that man's mind with an "inventive faculty," "inventive genius," with, in fact, anything other than ordinary reason, that he should be enabled to draw the *inference* from *his* own experience with the bramble: That, were it as strong as his plain wire, it would be more efficient as a fence; or in other form, Had his wire been armed as the bramble, his cows would not have pushed against it.

These quotations illustrate how vague and misty are the criteria of "invention," and Mr. Merwin says in his preface, "His aim has been to make the book essentially practical." And this, undoubtedly, he has done, so far as the subject would permit.

Judge Shepley says: "No more difficult task is imposed upon the court in patent cases than that of determining what constitutes Invention, and of drawing the line of distinction between the work of the inventor and constructor."

A careful reading of the decisions involving Invention, the summaries of Robinson, Merwin, and others, show that to distinguish between so-called "Invention" and the results of other normal mental practices which, according to these same authorities, are "foreign to Invention," if not absolutely impossible, is a task of the most abstruse, subtle and difficult character.

After forty-five pages of such an attempt, Merwin says, under the head of "Conclusion:"

"We are far from thinking that our suggestions are equal to the difficulty of the subject, neither do we fancy that the most thorough and correct analysis would render it easy henceforth to decide upon the presence or absence of it (Invention) in any given case."

This is but repeating in other words the remarks of Justice Brown of the Supreme Court in McClain vs. Ortmeyer, 141 U. S. 419, who, after speaking of the impossibility of defining invention, calls it "that *impalpable something* which distinguishes invention from simple mechanical skill."

Up to comparatively recent times the workers in the field of mechanical improvement were few, and the results scattering and disconnected, but withal great and surprising. It is not, therefore, to be wondered at that to those not directly connected with the day-by-day preparation these results should appear as the work of persons differently endowed to themselves, to whom both process and result alike appeared mysterious. It is the normal action of the human mind to ascribe to occult sources results beyond its present comprehension.

Owing to the comparative fewness and lack of connection between patentable devices at the time referred to, novelty frequently, if accompanied by complication of parts, was considered sufficient evidence of invention, so that, practically speaking, though on the statute books, the present idea of invention as a vital principle in patentability has been a dead letter.

The history of invention and the current decisions make the conclusion almost inevitable that, though theoretically a suppositious "something" other than novelty and utility was and is required, the practical working and effect has always been that apparent novelty in a high degree served to prove the presence of "invention," and a low degree of novelty to show its absence.

This course is pursued deliberately by some judges. Merwin says (page 17): "Certain judges do not even ask if a new function or effect has been produced. They assert that the statute requires only that the thing to be patented shall be new and useful."

This apparently rough and ready, though really scientific, method, whether employed deliberately or not, served excellently, and carried out the undoubted intention of the patent statute, viz: to reward the producers of devices of a high degree of novelty and utility, the result of unusual intelligence or industry. Open and continued practice on the same lines would doubtless continue to prove equally effective in carrying out the spirit of the statute.

*(To be Continued.)*

## Marketing California Produce.

TO THE EDITOR:—The difficulties now contended with are principally in reaching the consumer at reasonable cost. The producer does not receive enough and the consumer pays too much, and all from a lack of system, or proper method of doing the business. The natural laws of trade will in the course of time correct this evil; but life is short, and, if there is a better way, time and human efforts should not be wasted in waiting.

*Past and Present.*—Within my time the sickle has been replaced by the mammoth reaper—the ten-acre wheat fields by the larger ones—the smaller towns by the larger ones. The mechanics and laborers working industriously in the country towns have become absorbed by the large manufacturing centers. The small butchers have given away to the extensive abattoirs, and the small merchants to the large department stores; the money lenders to the great banks of deposit and transportation has been given over to the railroads.

*The Office of Concentration.*—These evolutions have come about along the lines of least resistance—or natural laws of trade—and in the interest of economy, in time, money and labor, to meet the growing necessities of the people, and competition from every quarter; and if we look for the controlling factor in these movements we will find that it is in the concentration of capital and labor and that there must be concentration before distribution. This applies to all human efforts; even these type could not be set up profitably without first being concentrated in regular order. Railroads or factories could not be built without a concentration of money in the banks. Merchants could not do a large business without the concentration of large stocks of goods, nor would professional men be of much utility without the concentrated learning of the schools, and all this must occur before distribution or dissemination is practicable.

The products of California are not concentrated to any extent either here or elsewhere, and are not in a situation to distribute economically or with dispatch, at any price, even if we had the demand for them, as they are scattered everywhere.

*Distribution from a Center.*—There are enough of the products of California, when taken together, to make a specialty of the business on a large scale, and I would suggest that if a full assortment of our products was concentrated at Chicago in one store, under the management of one competent and responsible business man, he could, through the circulation of hundreds of thousands of prices current, reach every consumer of any consequence throughout the Eastern States and furnish him, by the package, at rates for less than half of what is being asked now and yet return perhaps 25 per cent more for the goods than our producers are now getting.

*An Organization Proposed.*—To effect this I would suggest that a California corporation be formed, with a capital sufficient for the business and with stockholders without regard to their being producers or not, which capital should be entitled to 10 per cent per annum interest and a first charge on the profits of the business. Good business directors to direct and solicit consignments from here to be sold for the first season on a commission of 10 per cent, and any profit after paying expenses to be returned pro rata to the consignors and stockholders combined. Consignments should be moderate in quantity at first, so that any serious loss would be avoided, and they should be sent only by permission.

*A Competitive Trial.*—The Chicago agency would prove in a few months, by prices obtained, whether it would be more profitable to consign to it or not, and it would be preferable in all respects to allow the producer perfect freedom to sell or consign his goods where he chose, and depend upon the ability of the company to make better returns than anyone else could. Dealers and consumers would find that no one else could furnish an assortment of California goods, and by trading direct with this company there would be no speculative profit encountered, as the legitimate supply and demand should at all times make the market rates.

*Further Extension.*—If the project proved profitable, other agencies might be established and cold storage houses provided to care for perishable articles, so that train loads of fruit might be held for a market in good shape and avoid the serious loss of a surplusage. These and many other things connected therewith would follow as time and experience would suggest; but the main question is in starting upon well-known business principles without taking any unnecessary risk.

The capitalist in taking stock would perhaps be interested only in getting a reasonable rate for his money, and would not take stock otherwise. His

risk, however, would be greater than the stockholder who is also a producer, as the latter could count on getting much better prices for his produce if sold direct to the retail trade or consumer and avoiding the speculative jobber, so that he could well afford to pay 10 per cent commission, as any profits over expenses would be returned to him.

On this basis, I would—although not a producer for export—take a reasonable quantity of the stock, with the assurance that the business would not only be profitable as an investment but would enlarge the market for our productions to such an extent as to make all our industries profitable.

*In Anticipation.*—It will be admitted that if all the products of California were in the hands of one man, that he could name his own price without fear of competition, and as a good business man he would be careful not to make his prices so high as to interfere with the sale of all his goods in due season, and thus the producer would realize all the market would legitimately bear in price.

By laying down the goods at the door of the consumer at the lowest possible cost, there should always be a good margin for the producer, and yet be in a position to compete with any foreign production.

The producer here would soon learn that his fealty was due to such an agency, for the reason that to consign his goods to any one else would in effect be competing with himself; and being made a partner entitled to a share of the net profits in proportion to his shipments, without taking any risk as to the final outcome, makes the position of the shipper safe beyond question.

Should the agency at Chicago find a larger market than expected, and shippers withhold their goods for higher prices, then goods that were seen to pay a profit could be purchased here, and the profit thereon would belong to those that did consign, and consequently the return dividend might be greater than the ten per cent commission charged shippers.

*Intelligent and Easy Distribution.*—By this method the Chicago agency would soon learn, approximately, the current wants of the trade, and fruits might then be picked later and pushed directly to the consumer in proper condition for immediate use, and thus maintain our reputation for delicious fruit.

The retail dealer of the East, if he desires to sell our goods, would now have to send to a great many dealers in different cities in order to secure an assortment, and as he would not require more than one or two packages of each article at a time, he might have to write ten to twenty letters for a few goods in all, which makes the business so tedious, expensive and slow as to prohibit it altogether.

Under the plan suggested such a dealer, having a current price list before him, with the prices and quantity in each package, could order everything produced in California from one agency simply by marking on the price list the quantity he required of each article, and he could depend upon its being fresh and sound through methods of rapid transit.

*Advantage to Purchasers.*—Probably not one person in a hundred in the East has tasted our fruits in perfection. It has been picked too green, and even dried fruits have become tasteless from delay and exposure to such an extent as to seriously injure the very best of them, and then again the roundabout method of obtaining our goods has so increased the cost as to prevent their sale.

I have an Eastern circular now before me wherein they quote our wines in ten-gallon packages, delivered to the customer, as follows: Sherry wine, $2.75 per gallon; Port, Reisling, Claret, Angelica and Tokay, $2 per gallon, and very fine old Tokay at $4 per gallon. All these could be delivered by an agency of ours at less than half those prices and yet make a large profit.

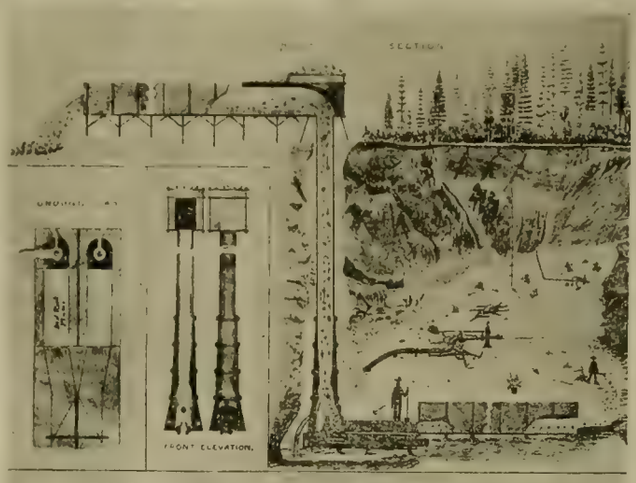
The first shippers of goods, packed and labeled, would reap a great advantage over later ones because they would be introduced to consumers first; and if satisfactory, the consumer would continue to order them rather than try new experiments.

It would simplify the business to sell by grades as much as possible and have the grading done here, at railroad terminal points, and bills of lading issued accordingly.

There has been more or less concentration of fruits and wines at various places here with good results, but the methods are not complete and too coercive; besides, in massing goods of all kinds under this plan one article will help the sale of others, and I dare say that the convenience of the small dealer and large consumer in being able to order all he wants from one place would prevent him from sending elsewhere for some one or two articles from foreign countries that happened to be a little cheaper than ours.

Temporary building, with good railroad facilities, should be procured at first, and then let time and experience determine what may be needed in the future.

The head office should be in this city, with a good board of directors to represent as many interests as practicable, and with a head manager of known ability and responsibility, there ought to be no difficulty in carrying out this plan successfully.



San Francisco. R. G. SNEATH.

## The Hydraulic Gravel Elevator.

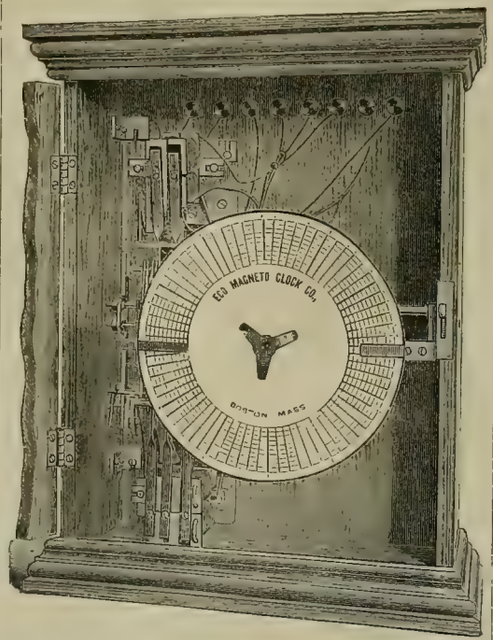
(Continued from page 261.)

and the facilities—amount of water, pressure, etc.—at hand.

The hydraulic gravel elevator can be made to serve the miner to great advantage in several different ways. First, in elevating the gravel immediately after being broken up by the giants and discharged in the upper sluice, to be carried away and deposited where it will not interfere with the work in the pit. It can also be used to great advantage in elevating the material after it has been piped by the giants from the face of the bank and washed into a sluice in the pit, as at the North Bloomfield at present. It can be used in low river bars, where no piping is done, for keeping the pit dry and elevating the gravel as it is picked and shoveled, or ground sluiced into it by hand, as at Mammoth bar, on the American river, where it has proved a great success.

R. H. CAMPBELL'S DUPLEX HYDRAULIC GRAVEL ELEVATOR.

There is little cost or trouble with them when once placed in position. It has been found to work best when set perpendicular, or nearly so.



The Campbell elevator seems to be the most improved. It provides for doing its own pumping, and is double, which gives it other advantages.

There is a limit, as in all other things, where the gravel is to be elevated 30 or 40 feet. Where the facilities are at hand, they can be made to elevate 50 or 60 or even 65 or 70 feet and work profitably. Gravel does not seem to cause any material difficulty with the elevator; it is the water it has to lift that regulates its load.

In connection herewith appears an illustration of Campbell's gravel elevator as recently perfected.

## Eco Magneto Watchman's Clock.

A watchman's clock that is simple in construction, not liable to get out of order, requires no battery and is easily adjusted, is herewith illustrated.

The paper dial is daily renewed, and the record is infallible. It is so arranged that it is impossible to tamper with it without being detected. The clock can be seen at the office of the Simonds Saw Co., 31 Main street, San Francisco, and at 85 First street, Portland, Or. Clocks adapted to any number of stations from four to twenty are furnished. The utility and economy of such a device is self-evident.

## The Assay of Silver Sulphides.

A recently published paper by Mr. H. Van F. Furman, Denver, Colo., on crucible assays referred to the use of iron nails in the assay of silver sulphides. When the paper was read at the October, '95, meeting of the American Institute of Mining Engineers, the following discussion took place, which as a part of the entire subject is herewith published:

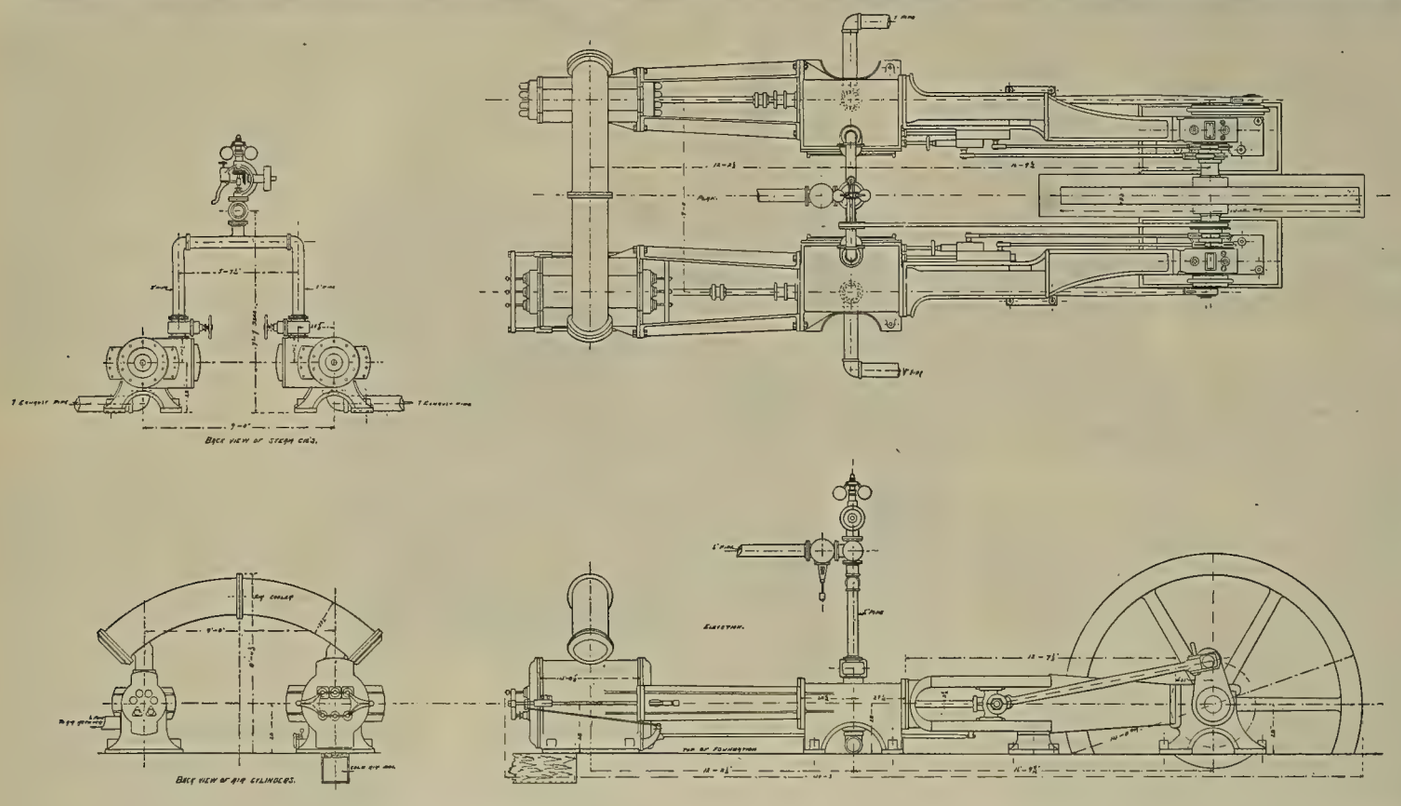
Albert Arents, Alameda, Cal.: From Mr. Furman's description of his crucible assays I infer that he regards iron nails as a necessary or advisable adjunct. Against such a notion I must beg leave to protest. Nails should not be used in this method of assaying for silver. They not only do no good but may be a cause of loss, especially in operating upon material so rich as silver sulphides. It is difficult to conceive for what purpose iron nails would be introduced into a crucible in such a case except that they may take up sulphur, forming therewith a matte. But any matte so formed will contain some silver, which is thus withheld from the regulus and lost to the assay. Even if no matte is formed, the nails are detrimental because they must be withdrawn, coated with argentiferous lead from the molten contents of the crucible before pouring. This constitutes another loss which might be avoided.

On the other hand, if no metallic iron is employed in the assay, but a sufficient amount of litharge is added to oxidize completely the sulphur in the charge, leaving at the same time some excess of oxide of lead, both the sources of loss above indicated are avoided. The result of such a crucible assay, properly conducted in other respects, would be worthy of comparison with that of scorification. The question of the relative accuracy of the two methods is interesting and deserves further investigation, in which, however, both should be handled with equal care and favor, so that each may accomplish the best results of which it is capable.

H. Van F. Furman, Denver, Colo.: As regards the use of nails in the assay of silver sulphides, I agree with Mr. Arents, that they are unnecessary. The amount of sulphides present is so small that the litharge used will serve all purposes. I cannot agree with Mr. Arents, however, that nails should never be used in the crucible assay of silver ores. In the case of ores rich in sulphur, arsenic, or antimony, I regard metallic iron as most useful flux. With such ores, it becomes necessary to add either metallic iron or some oxidizing agent more powerful than litharge, such as niter. Where litharge alone is used to effect oxidation, a large amount must be used, and, should the ores be rich in sulphides, such a large button will be obtained that repeated scorifications will be necessary before it can be cupelled. Should niter be used, it becomes necessary to determine the reducing power of the ore. This requires a preliminary assay; and the assayer at a modern reduction works has no time for preliminary assays. In our Colorado practice, niter is additionally objectionable as, in order to avoid the bubbling over of the charge, large crucibles are necessary. Large crucibles cannot be used where the fusions are performed in the muffle, as is the Colorado practice. When the ores are rich in sulphides, the use of metallic iron necessarily involves the production of matte. However, this should not result in loss of precious metal, as the matte should be saved and scorified, together with the lead button, prior to cupellation. That the use of nails results in loss from their being coated with argentiferous lead when withdrawn from the crucible, is only true in the most careless work. No careful assayer will withdraw the nails without first carefully washing them off in the slag so as to remove any adhering particles of lead. When the work was carefully performed, I have never known the use of nails to result in loss. It is for the above reasons that nails are almost universally used in Colorado when the ores are rich in sulphides. A nail was added to the charge in the case of the assays under discussion, in order to make the method conform to the usual practice.

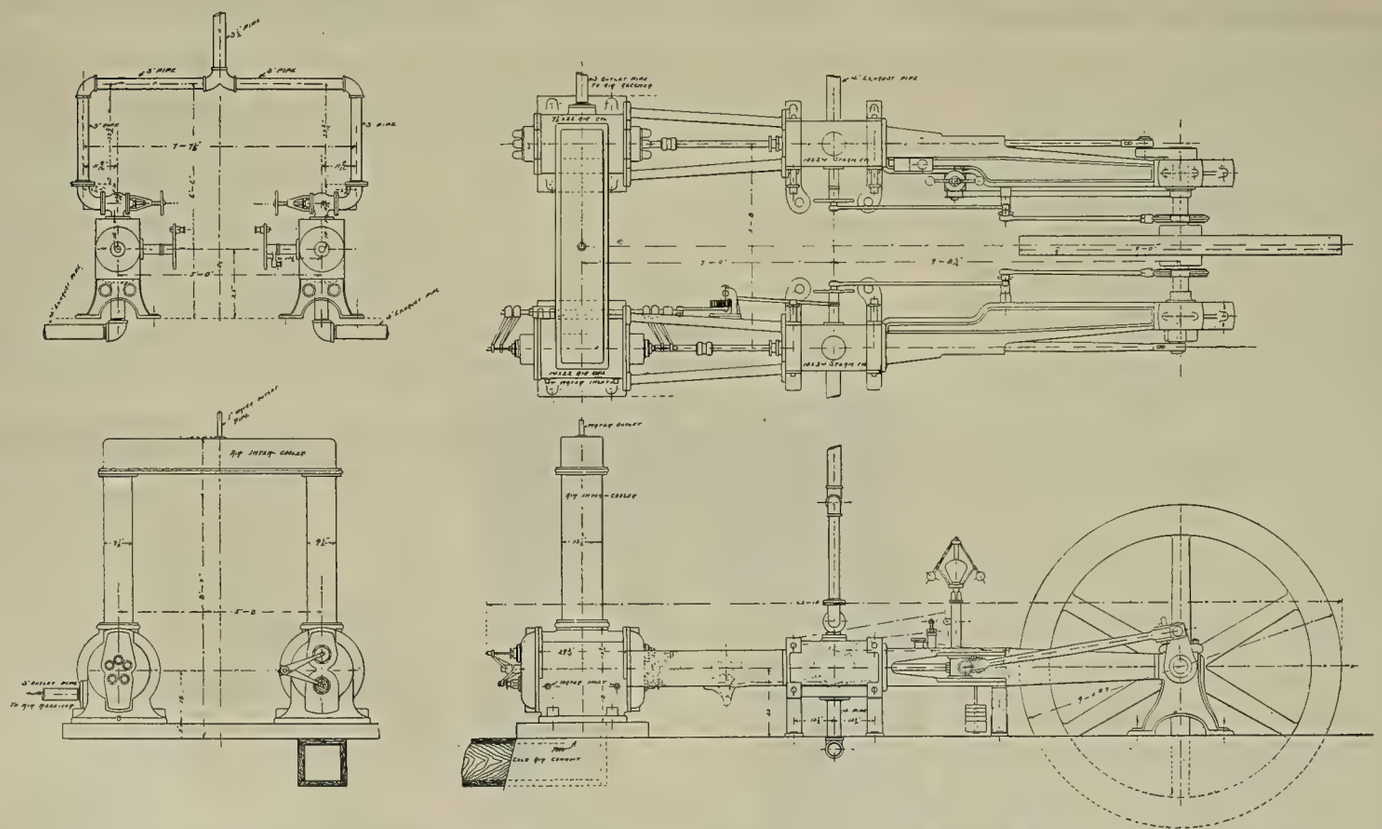
As I stated in my paper, these crucible assays were not made because this was considered the proper method for such material as silver sulphides, but in order to draw attention to the relative accuracy of the crucible and scorification methods. Such being the purpose, the assays were made in the same manner as would be pursued in careful commercial work. I am inclined to believe that such material may be preferable assayed by the combination method, as outlined in my paper.

# Mechanical Progress.



## Air Compressors for Railway Use.

Considerable has been said in these columns regarding the extending use of compressed air, the subject being of particular importance. New uses are constantly being made of compressed air, in railroading as well as mine and other work, and herewith are illustrated two compressors furnished by the Rand Drill Company to the Chicago & Northwestern and Atchison, Topeka & Santa Fe railways respectively. The Atchison compressor has been in use at Topeka for some time. The one for the Chicago & Northwestern has just been delivered.

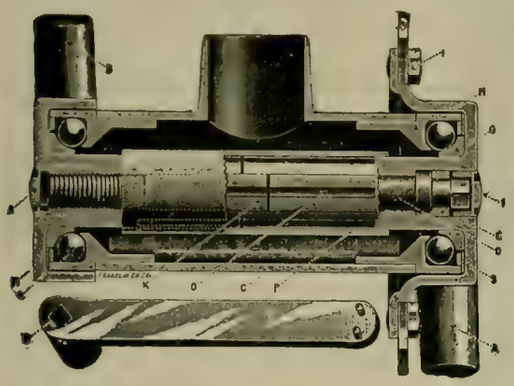


It will be seen from the illustrations that the two machines are of the same general type. The compressor at Topeka has Meyer cut-off engines with 20x48-inch cylinders. The air cylinders are of the Rand patent cross-compound type, 16x48 and 28x48 inches. The cylinders are furnished with an intercooler, which carries the air from the low to the high-pressure cylinder, and effectively cools it in passage. The cylinders are fitted with the Rand new mechanical air valve, which the manufacturers believe to be an ideal valve for the purpose—and the problem of finding a satisfactory air valve with a positive movement has been a difficult one. The conditions in the use of steam and air are very different, and valves which are satisfactory with the former will be found to cut and become leaky in the dry heat of air. Various automatic releasing gears have been applied to air valves, but with indifferent results. Valves of the ordinary poppet form chatter more or less, and they do it because while the air is trying to pull the valve open the spring is trying to pull it shut. In this gear of the Rand Company the valve is released from the pressure of the spring while it is open. The spring is used to close the valve and is strong enough to do it positively, but before the valve opens and while it remains open it is entirely released from the pressure of the spring. It goes wide open and stays there. The device entirely does away with the chattering.

The compressor of the Chicago & Northwestern has a Corliss valve engine, with steam cylinders 10x24 inches. The air cylinders are of the same pattern as in the compressor of the Atchison Company, but smaller, being 7½x24 and 16x24 inches.

The adoption of these improved types of compressors by railway companies has been the result very largely of the campaign of education which the manufacturers have been carrying on for several years. How successful in a general way that has been is shown by the statement of the Rand Company that in and about Chicago alone there are 3,600,000 cubic feet of air furnished to machine, boiler and railway shops a day by this company's machinery; 15,000,000 gallons of water

RAND COMPRESSOR IN THE ATCHISON, TOPEKA & SANTA FE SHOPS.



RAND COMPRESSOR FOR THE CHICAGO AND NORTHWESTERN RAILWAY, SHOWING DETAILS OF ENGINE AND INTERCOOLER.

are pumped by them from deep wells daily and over 9,000,000 cubic yards of rock were excavated from the Chicago drainage canal in three years.

Three large compressors of 4000 cubic feet capacity have recently been sold by that company: One to the Woodward Iron Company of Woodward, Ala., which has Corliss engines, 24x48, and compound air cylinders, 22x48 and 32x48 inches; one to the Helena and Frisco mine, with compound condensing Corliss engine, and otherwise the same as the above, and one to the Dominion Coal Company at Cape Breton, which is the same in all respects as that furnished to the Helena and Frisco mine. The use of compounding is a question which has to be largely governed by circumstances. The manufacturers, however, urge it whenever possible, and the tendency to do so among railway companies is increasing. H. D. Morris & Co., 141 and 143 First St., are the San Francisco agents.

### The "Racycle" Narrow-Tread Crank Hanger.

The cycle craze of '95 continues in '96, and "Mechanical Progress" continues to note improvement in this form of locomotion. Among the most recent is the narrow-tread crank hanger which is herewith illustrated, the aim being to obtain a narrow-tread hanger easy of adjustment, and

with bearings from 1¼ to 1½ inches farther apart than in any other narrow-tread machine. Friction is reduced to a minimum by the bearings being placed in the hubs of the cranks, and the sprocket running inside the bearings, instead of outside, the power being applied through the cranks directly on the bearings. The crank and crank axle are in one forging, and connected with a rifled clutch over which is used a rifled sleeve, making an absolutely positive connection. The hanger can be completely assembled or dissected in less than half a minute and without dissecting the chain. The wheel is built by the Miami Cycle Co., of which F. R. Grimes is the Chicago manager.

## Electrical Progress.

### Some Notes on Dynamometers.

As long as motors and manufacturing machinery continue to be made so long will the necessity exist for measuring the power which the first named are capable of producing and which the latter require in order to develop their capabilities, and, in an equal degree, is the need always present of being able to determine by measurement the power required in order to run complete mechanical contrivances which entail the most varied conditions. This existing need has led to the result that in the course of time a stately row of dynamometers of most varied construction have been produced. Generally, dynamometers may be divided into two principal groups. The first may be called that of absorbtion dynamometers. These are such wherein friction resistance is created, which holds an equipoise against the force produced and is capable of being measured. All apparatuses belonging to this group are only available for the measurement of motor power and are generally referred to under the general term of "brake power." The best known apparatus in this class in the universally known Prony Brake Power. This apparatus labors under numerous disadvantages and is not suited to permanent experiments.

The attempted improvements thereon which were made by Wayer, Richmond and Candial, were, however, crowned with little success. Then Imray produced a cleverly thought out apparatus for permanent experiments, in which contrivance the resistance was kept uniform and constant by means of an adjustable friction surface.

A still better and very cleverly contrived apparatus was next produced by Prof. Brauer, which is the one now most widely used, the most suitable for permanent tests and gives very exact results.

In all brake-powers it is the friction resistance which counterpoises the developed power of the motor aud it is, consequently, necessary to take care that, in permanent tests, the heating of the friction surfaces does not become too great, as, if this happens, the exactness of the results is very likely to be diminished. For this reason the friction surfaces must be sufficiently large. It is only with difficulty that greater forces are measured, and then the measurements are only approximately correct.

The second group of dynamometers is that of the so-called transmission dynamometers. Whereas the dynamometers of the first group, the brake powers, are exclusively used in order to measure the power which motors are capable of producing, those dynamometers which belong to the second group are used principally for the purpose of measuring the power required to work a machine, shafting, or a complete set of machinery. In this group it is either the tension of the belts, the pressure of the gearing wheel-teeth, or the deformation of an elastic member of the apparatus which maintains the counterpoise to the running power and measures the latter.

Bauki invented an apparatus intended for the measuring of the tension of the belts, and Thompson produced an apparatus for the like object. These and such like apparatuses are, however, only available for small power and for not long duration, inasmuch as the feathering spokes very easily become useless. Schuckette and Kasalowsky used springs as connections between the loose and the fixed pulleys in their apparatuses.

But all of these dynamometers give inaccurate results, because the centrifugal force acts disadvantageously on the springs. Moreover, in the above named and kindred forms of dynamometers the disadvantage presents itself that the power does not move in the direction of the spring-tension, but acts in a radial one and, for this reason, in every altered position of the spoke-crosses a new power movement arises; consequently, no exactness.

In order to avoid these difficulties Fuess uses a flat spring which is placed between the fixed and loose pulley around the shaft.

But, inasmuch as the alteration in diameter of the spring is very small and the transmission of the same in the drawing apparatus (indicator) takes place from the small levers of the shear to the larger ones and hence, again, proceeds through a short lever on to a long one belonging to the indicator; exact measurements cannot be made with this apparatus.

Fishinger's model may also be mentioned as classed under this group of dynamometers. This apparatus is free from the disadvantages which the elastic members of the above mentioned apparatuses bring with them. But the friction of the levers and belts, which becomes greater in proportion to the increasing dynamic force produced, interferes materially with the result.

Of the dynamometers in which the pressure of the gearing serves as the medium for measuring the force produced, that made by Rieter & Co., of Winterthur, is well known. This apparatus is largely used in Switzerland and South Germany. The same is serviceable for measurements up to 15 H. P. and gives very fine results when in skilled hands.

All previously mentioned dynamometers, of which there are still many other varieties, are limited in the extent of their utility. They are nearly all intended to mark off power lines and do so with more or less precision, but not one of them is available for summarizing the amount of power passed through the apparatus or turned to account.

The latest and most important species of apparatus is that invented by Wilhelm von Pittler.

The following principals were made the guiding basis of this construction, viz: summarizing and reading off the total of the power passed through; a greater stroke for indicating the variation of power, and simplicity in the mechanical parts and in manipulation.

In order to obtain a great stroke the maximum angle of the fixed and loose pulleys to each other was determined as 120°, and for this stroke, as elastic means, a spiral spring was selected which serves to connect the fixed pulley with the loose one, inasmuch as all experiments with screw-springs, such as are used in the apparatus referred to above gave no available results. The spiral spring, however, especially suitable to the desired end, because its measurements allow of determining that, at 120 deflection of the pulleys towards each other, its deflection or deformation only amounts to a small proportion of its elastic limits.

The connection of the spiral spring with the two band pulleys is effected in such wise that the inner end, having a hooklike bend inwards, catches into a slip in the hub of the fixed pulley and passes firmly over and around this hub with its first coil. The feathering end of the spring begins just at this point. The outside end of the spring is bent outwards; this bend catches on behind a noose on the loose pulley to which noose the spring is further secured by screws. Next in order to measure and summarize the total power produced by the band pulleys, which power is conducted through the apparatus, the following contrivance is used, viz: An eccentric is secured firmly to the shaft; this eccentric makes the same motions as the fixed pulley and the inner end of the spiral spring. On this eccentric is set a second eccentric which catches with a pin into a slit into the loose pulley and is thus connected with the latter and with the external end of the spring. Both eccentrics have the same stroke, so that when both strokes are opposite to each other they cancel the other and become O. When the strokes are in the same direction the united strokes will be equal to the amount of both strokes. It will be easily understood from this that the joint strokes of both eccentrics change with the turning of the band pulley against each other, i. e., with the tension of the spiral spring or the variations of the through-conducted power. The stroke of the eccentric is transferred to the registering apparatus, a sort of slide which is coupled with a counting apparatus. This slide (as it is called for want of a better term) consists of an inner disc, firmly connected with the lever, which follows its movements forward and backward. Over this inner disc the summarizing disc is arranged, which moves only in one direction, and is carried along by the inner disc when the lever moves forward, stopping when the lever returns until it again moves forward.

The strokes of the lever can be so fixed as to be of an exactly determined measurement for an exactly specific power. Now, if the summarizing disc is graduated around its edge, with 200 grades, it can be so arranged that, for a certain total power the stroke shall amount exactly to ten grades. If, therefore, the product from the total power of ten grades per the radiance of distance is known, if it would, for instance, amount to 1,000 meter kilograms in one revolution of the summarizing disc, one thousand multiplied by fifty equals 50,000 meter-kilograms and would be the amount of power conducted through the apparatus. As the summarizing disc is directly connected with a counting contrivance, on the counter itself, so soon as the summarizing disc has made one revolution, a figure is pushed forward, so that each figure of the counter indicates the consumption of 50,000 meter-kilograms. This remains constantly correct, whatever the total power may be, for, if the same equals ten grades, then the summarizing disc will have revolved once on fifty strokes of the lever so that the total of the meter-kilograms consumed in one revolution of the summarizing disc must of necessity remain the same. If the aggregate power only amounts to one-tenth so that it equals only one grade, then the summarizing disc will only have completed one revolution after two hundred strokes of the lever.

This apparatus is said to be absolutely the only one which can summarize the whole of the power transmitted or turned to account, and this characteristic raises it far above all previous constructions and causes it to appear on the arena of power-measurements as something entirely new and special. It is this summarizing quality in respect of the expended power which raises it to the position of an actual measure of power and value. Through this apparatus alone, and for the first time, is one placed in the position to ascertain the value or capabilities of each individual machine or of those of a complete set thereof. By means of this apparatus one can ascertain what are the extreme capabilities of a whole establishment on the smallest admissible consumption of fuel, and it furnishes, moreover, a test whereby one can learn whether the capabilities become reduced again and if so, from what cause.

The dynamometer is consequently, of equal value as an instrument of power to lessors and lessees. The expenditure of power is indicated by the figures of the counter and calculated in accordance therewith.

The construction is extremly simple, as all delicate parts are excluded. It is available, as an independent apparatus for the measurement of power either of individual machines, or of a whole establishment. It can also be used as an intermediate countershaft, and as such is in addition to its qualities as a dynamometer, an excellent elastic impulsion, especially for electric motors.

The consumption of motive force, be it fuel in the shape of coal, steam, hot air, oil, etc., water power or electricity can be controlled per absorbed power unit, so that both power lessor and lessee can check off the consumption of power at any time, say weekly, monthly or yearly, in the most precise manner. It may also be added that the Wurttemberg government has decided upon introducing the dynamometer into its locomotive shops.

## Scientific Progress.

A TENDENCY in some quarters to return to the old "vitalistic" theory of living matter has been noticed. Professor Bunge gave the first serious impulse to this movement in a series of lectures delivered several years ago. In his presidential address before the American Microscopical Society last summer, Professor Simon H. Gage said: "It can be stated without fear of refutation that every physiological investigation shows with accumulating emphasis that the manifestations of living matter are not explicable with only the forces of dead matter." This announcement places Professor Gage

among the neo-vitalists also. Sir William Thompson (Lord Kelvin) affirms essentially the same view. Professor Burdon-Sanderson evidently sees in this revival of a modified animism danger to scientific progress, and in a lecture recently delivered before the Royal Institution argues against it. The mystery of vital phenomena he prefers to call still a mystery. He denies that it is a new form of force, but rather an unexplained form of known forces, chemical or physical. The neo-vitalists do not assert that the life force is something spiritual, a *deus ex machina*, as was formerly held. Their contention is that it is another form of force, having its chemical and physical equivalents.

THERE seems to be no end of discoveries in connection with the recent announcement of the remarkable work of the now famous professor of Wurzburg, who, by the way, is now "Baron Roentgen," having just been ennobled by the German Government. The latest addition to our knowledge of what until recently seemed a field of darkness comes from Dr. Emmens, well known in San Francisco as an investigator and the inventor of a powerful explosive, "emmensite." There seems now to be a possibility of reflecting the "X" rays and so concentrating them that photographs instead of mere shadow pictures can be produced. Dr. Emmens is said to have obtained pictures of objects enclosed beneath the vulcanite screen exposed to sunlight for thirty-six hours. Certain outlines and shadows convince him that "X" rays are reflected. Pursuing his investigations and acting upon the theory that "X" rays are universal, an attempt was made with apparent success to collect them from darkness by the aid of various chemical compounds. An instrument which he has invented and calls the photoscope will, it is thought, when completed, enable the surgeon to see with his own eye the interior of certain portions of the body. In this connection reference is again made to Professor Salvioni's method for enabling us to see through solids as through a photographic camera. The apparatus used consists, as previously described, of a cardboard tube, one end of which is closed by a sheet of black paper coated with a layer of fish glue and calcium sulphide or platinum cyanide, either of which compound is very phosphorescent under the action of the "X" rays. The other end of the tube contains a lens giving a clear image of the phosphorescent paper. The plan is to transform the Roentgen rays into ordinary luminous ones before they reach the eye. The paper is thus illuminated in those portions which receive the rays and the silhouettes of the objects appear dark. Professor Salvioni maintains that by the aid of a camera not only the shadows but the images of the objects can be reproduced, facts which appear to have been proven by Professors Battelli and Garbasso of Pisa.

A QUESTION which is often puzzling is asked in connection with photometry. The law of distribution of light is that its intensity varies inversely as the square of the distance from the luminous source. If, then, the distance from the source of light is 2 ft., "I am taught to believe (says a correspondent) that the intensity is ¼, while at 4 ft. it is $\frac{1}{16}$, and so on. But at 1 ft. distance the intensity should be $1 \div 1^2$ or equal to the intensity at the source. How is this?" The reason is that the inverse squares of the distances furnish ratios to the intensity of the light *at unit distance* from the supposed point source, and not at the source itself.

**Great Reduction in Light!**

**IMPERIAL**

**Automatic Gas Machine**

**Produces a Beautiful Light.**

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

## Practical Information.

A METHOD for the separation of tellurium from copper residues is described by Prof. Whitehead in the Journal American Chemical Society. In the electrical refining of copper the washings from the gold residues contain the tellurium as tellurous oxide or sulphate. The tellurium may be obtained from these either by precipitation with copper or by passing sulphurous anhydride through the solution. It may be finally purified by distillation in hydrogen. When a solution of sodium tellurite is added to a solution of an ammonium salt, a white precipitate of tellurous anhydride is thrown down, which becomes granular on boiling. A small amount of tellurium or of some metal which can be precipitated by sulphurous anhydride remains in solution, this soluble portion is still under investigation. Potassium ferrocyanide does not react with tellurium chloride at once, but after a few hours Prussian blue is formed. When tellurium is heated with aluminum the two combine with explosive violence, forming a chocolate colored, difficultly fusible compound, which has the composition of $Al_2 Te_3$. It is hard and brittle, and can readily be ground to powder; when exposed to moist air it is decomposed, and hydrogen telluride is slowly evolved. When thrown into water it is rapidly decomposed. Tellurium is readily deposited by an electric current either from an acid or alkaline solution. It has been found possible to separate tellurium from copper by adding an excess of sodium hydroxide and about three grams of potassium cyanide for each gram of copper present, and passing an electric current through the solution, when the tellurium is thrown down as a black, nonadherent precipitate which can readily be filtered off. The solution can then slightly acidified with sulphuric acid, and the copper estimated in the usual way by electrolysis.

A BILL has been introduced into Congress authorizing the Secretary of the Navy to construct cruisers after the Painton design. Placing the present propulsion efficiency of ships at 55 per cent, Mr. Painton claims, by the combination of steam and electrical machinery, to secure an efficiency about four times greater than that of steam engines applying their power without the intermediary of dynamos and motors. The inventor promises that with this system he can develop a speed of forty miles an hour in an ordinary passenger ship, and thirty-five knots an hour in a naval ship, under the usual conditions of sea and wind. The vessel is to have fourteen screw propellers arranged along the side, each to be independently operated from a switchboard. There are two propellers forward and aft at regular intervals. The two stern propellers are located under the overhand of the stern. Each forward and aft propeller consists of two wheels so arranged on the shaft that the blades of the forward wheel are opposite the opening between the blades of the after wheel. It is understood that with this system 1800 revolutions have been reached, and that 800 can be depended upon in service. The inventor says that he can reduce the loss attending transmission of power in a 20,000 H. P ship from 6600 to 2000 H. P. Each propeller is to be worked by a separate motor, the common current being generated by a central plant. Mr. Painton states that this system will enable a ship's speed to be increased say from twenty to forty knots an hour, with slight additional H. P.

AN electric lamp that can be carried in the pocket has been produced in Germany by Herr Bohwinkel. It is made either in cylindrical form or like a flat flask, a small glow lamp in each case forming the upper portion, while the battery is the base. A so-called "revolver battery" of three platinum-zinc elements gives a current of four or five amperes at six volts. The filament is caused to glow by tipping the lamp, and in a lamp of 10 inches in height by 2 inches in diameter continues to give a bright, white light for an hour and a half with one filling. A patent battery fluid is used, of which one quart is sufficient to fill the lamp sixteen times.

LORD KELVIN has been making experiments to discover what the effect of a cannonade of quick-firing guns would be on board the vessel firing and the ship subject to the fire. He finds that after fifteen minutes' firing the survivors of the crews of both vessels would be reduced to a state of mental if not physical incapacity, owing to the concussion of the projectiles on the sides of the vessel and the noise of the guns.

**HENDY - NORBOM ORE CONCENTRATOR.**

Office of ORLEANS MINING COMPANY, GRASS VALLEY, CAL., Dec. 12, 1895.

*Mr. John O. Norbom, San Francisco, Cal.*—DEAR SIR: Replying to your inquiry regarding the working of your Concentrator, I take pleasure in stating that the machine is doing excellent work. The curve springs give the machine a very gentle motion, which makes it mechanically perfect. We are saving our sulphurets very clean and lose a trace only in the tailings. The machine takes pulp from five stamps, handling about nine tons per twenty-four hours with ease. Our ore carries from 3½ to 5 per cent of sulphurets. The latest improved belt gives good satisfaction; it has now run about five months. I expect it will last about fifteen, which speaks well for canvas belts. As for little attention and easy working, I can recommend it to any person as being the best machine I have ever used. Wishing you success, I remain, yours truly, [SIGNED] C. A. BROCKINGTON, Superintendent.

Office of FEDERAL LOAN MINING COMPANY, NEVADA CITY, CAL., Dec. 10, 1895.

*Mr. John O. Norbom, San Francisco, Cal.*—DEAR SIR: Your Concentrator, which has been in use in our mill for the last six months, is still doing excellent work. At present we are running the pulp of ten stamps on one machine, without seeming to be overloaded. I can recommend the machine to do all and more than you claimed for it. Yours truly, [SIGNED] J. VINCENT, Superintendent.

**The Improved, Iron-Frame, Self-Contained, Cushion-Frame, Five-Stamp Mill Saves Bills for Heavy Timbers, Millwright and Mechanics' Labor, and a Large Amount of Space. The term "Self-Contained" Means a Great Deal to the Mine Owner, and Can Be Readily Recognized and Appreciated in Making an Estimate For an Ordinary Five-Stamp Plant, When the Comparative Cost is Considered Over a Wood-Frame Mill**

**FIRST: There is Saved by the Use of This Mill a Large Bill for Heavy Timbers, in Many Instances Obtained at Great Expense and Loss Of Time.**

**SECOND: The Saving in Mill-Wright and Mechanics' Labor in Framing and Erecting.**

**THIRD: The Large Amount of Space Saved.**

We refer by permission to Mr. N. A. McMillan, Haines, Oregon, manager of the Blue Mountain Mining Co., at Rock Creek, Or., where ten of our stamp mills are in operation; also to Mr. John S. Miller, Helena, Montana, manager of the Diamond Hill Mining Co., operating one of our forty-stamp mills at their mines at Townsend, Montana.

Send for Catalogue and Price List.

CORRESPONDENCE SOLICITED.

# Mining Summary.

## CALIFORNIA.

### Amador.

At Jackson action began last Tuesday in the $2,000,000 suit brought by the Keystone Con. G. M. Co. vs. the South Spring Hill G. M. Co. The plaintiff claims that the entire works of the defendant are on its lode, it having its apex on the grounds of the first named company.

At the Ironmass mine, in Robinson district, a recent crushing of over 300 tons at the Acme mill averaged $28 per ton, without any attempt to save sulphurets which assay $250 to $290 per ton. The owners contemplate putting in machinery to save the sulphurets in future crushing.

The Alpi, two miles southeast of Jackson, is a patented claim. A shaft has been sunk over 100 feet, showing a strong ore body. The property has been bonded for $20,000, payable in thirty-three months, and a local company has been organized to operate it.

*Record:* Petroleum is now being used as fuel at the Gover mine, and a six-horse team hauls in a big cash of the oil every day. This is poured into an immense stationary tank, which is connected by pipes with the furnace. Two new boilers have been put in at the mine and the mill was started up this week.

The difficulties which have retarded operations at the Mechanics mine have been satisfactory adjusted and work will be resumed immediately. As soon as water can be gotten to the mine the new ten-stamp mill will be started up.

At the South Eureka they are sinking from the 1050 level, intending to go down 200 feet. They are keeping the mill running by stoping in the 950 and 1050 levels. A new level is being opened up down 650 feet so as to reach the ore at that point. The mine is looking favorable.

### Butte.

Prather & Co. are opening a quartz mine two miles from Cherokee. Six men are developing the ledge.

The Portuguese miners are rigging up derricks and preparing to mine opposite the Waldeyer residence. T. L. Vinton has twenty-five men employed near the tunnel.

Theo. Wetzel of the North Bloomfield is operating the Osgood gravel mine at Bangor. Machinery is being placed on the property.

### Calaveras.

Sadie E. Chamberlain has sued the Carson Creek Mining Company for $50,000 damages for the death of her husband, C. C. Chamberlain, who was killed by the caving of a stope in which he was working in that mine.

The Alpine mine, near El Dorado, has been bonded to W. T. Mendenhall for $17,500.

E. H. Brandt has taken hold of the Gottschalk mine, will put up the necessary machinery and sink 1000 feet before doing any other development work.

### El Dorado.

(Special Correspondence.)—Dr. Wagner & Son of Sacramento have begun a tunnel and drift work on eighty acres of gravel near Fairplay, twenty miles south of Placerville.

Amsden & Naughten of Sacramento are opening a claim adjoining the property of Wagner & Son, near Fairplay.

J. Baughman is developing a quartz ledge on the old Fort Yuma property, below Big Canyon mine, and hauling the ore to the Jack Rabbit mill, owned by John Darrow.

Daniel Klaus has bonded a claim to N. G. Gifford, four miles east of Latrobe, and development work is in progress.

Wm. H. Reinbold, at Garden Valley, is sinking a shaft on the Keystone. He has reached 60 feet depth. The ore is low grade and the vein is 4 feet. He is also sinking on the Shenandoah, finding two parallel ledges of free milling ore.

The old Colwell mine, near Lotus, ten miles south of here, has been bonded to Clark McMillan. Lotus is near Coloma.

Properties on the Georgetown divide are coming into activity. These are located to the north of Placerville about sixteen miles.

The old Bob Red mine, owned by Varozza & Alderson, is attracting the attention of Denver people, who are negotiating for a bond.

Negotiations are pending for the sale of a large area of gravel properties, with mills upon them, within three miles of town. New York capital is interested in the deal.

Active development work has been begun on the old Judge quartz mine, near Kelsey. The shaft will be sunk to a depth of 300 feet.

New machinery placed on the Big Sandy is in operation. The water has been taken from the old shaft, which will be carried to a depth of 500 feet.

Much energy is displayed in every direction throughout the county by capitalists and prospectors looking for quartz properties and deep mining propositions. An active revival has struck even old El Dorado.

An additional shaft has been completed on the Larkin, making the double compartment space 4x9, one to be used for the new steam pump and the other for the hoist. The north and south drifts are now each 100 feet. The shafts will be carried down 500 feet. The ore body is not only satisfactory, but of an encouraging quality.

Negotiations are on foot for the old Griffith Consolidated, adjoining the Larkin on the south.

The Bullion has been bonded to C. F. Bryant. This adjoins the three Manzanitas—King, Queen and Princess—on the east.

There is a fair prospect of resuscitating the old Pacific group of mines. These run from Weber creek to the American river, passing under the courthouse. They extend for a distance of four and one-half miles, and are owned by a Scotch company.

Wood, water, climate, large ore bodies, good roads and railway facilities are inherent qualities of the mother lode vein of this county, and capital is gradually ascertaining these facts.

Moneyed men have obtained from Frank Koepfer a bond on his property below Lotus, on the banks of Weber creek.

Senator Jones of Nevada has begun prospect work in this county with considerable vim on the old Roscoe mine.

The advent into the county of Monroe Salisbury and W. H. Crawford of Chicago, who become joint owners of the large Sam Salisbury mining field, is greeted as a foreboding of the influx of large capital. They have secured property of merit and are preparing to erect an extensive plant.

Placerville, Cal., March 31, '96.

A Greenville correspondent of the Placerville *Democrat* says it is ridiculous to talk about hard times when the Indians are making from $2 to $3 per day panning out near the Greenstone mine.

### Lake.

The Abbott quicksilver mine is reported sold to A. T. Buggers, representing Eastern men, for $125,000, one-half cash, balance secured by mortgage. Supt. A. A. Gibson will continue operations.

### Los Angeles.

The Los Angeles Mining and Stock Exchange has incorporated. Two hundred and fifty shares have been voted at $100 each. Twenty-two have applied for charter membership.

### Mariposa.

The Coulterville *Miner* thus disposes of the Merced G. M. Co affair: The Merced Gold Mining Company have laid off some men during the week in their mines. The Bigelow and Mary Harrison still continue development work. The mill has been closed down for the time being. It is expected in a short while this company will resume operations in full blast, and the next important move will be the building of another large mill.

### Mono.

The Bodie *Index* says that a fourteen-foot ledge of $20 ore has been struck in the Lent shaft below water level, and advocates a big electric pumping apparatus to drain that and other mines.

*Miner:* The Standard Co. is now putting up another cyanide plant. It will be erected down the canyon near the old Wagner millsite. It will probably be in running order by May 20th. After this is completed, the Bodie cyanide plants will have a daily capacity of about 410 tons, as follows: Standard Co., 200; Southend, 160; Bodie Tunnel, 25; Parr & Tyack, 25. The snow is nearly all gone, and, unless more falls, it is expected that the different plants will be started up within a month.

### Napa.

John R. Armstrong has leased 500 acres near Napa, where he will bore for oil.

### Placer.

Searing and Bryne are negotiating for the purchase of the Emanuel Polifka ledge, near Last Chance. It is expected that the first installment of the purchase—$5000—will be paid on April 6th.

The Pioneer G. M. Co. is about to add forty stamps to its mill. It is one of the big California gold producers.

*Sentinel:* At the Herman mine the mill daily crushes 35 to 38 tons. The March clean-up was $10,000. The sulphurets are showing well and will justify shipping to San Francisco for reduction.

Ten additional stamps will be placed in the mill next month if the weather remains favorable, thus increasing the output 50 per cent without extra expense for power or management, as the present engine and attachments were placed with a view to increase the number of stamps to twenty if desired.

### Riverside.

The Santa Rosa mine, near Perris, has straightened out its financial difficulties, and resumed operations. C. A. Winters is the receiver in charge of the property. James Noonan is the foreman. Twenty-five men are at work, and the ten-stamp mill is running.

### San Bernardino.

Judge Welborn of the United States Court has appointed John D. Polk Master in Chancery to examine into the accounts of the receiver of the Vanderbilt group of mines.

### San Diego.

At Hedges 300 tons of ore pass under 140 stamps every twenty-four hours.

At Picacho considerable development work is under way.

At the Adsit camp, American Girl, Blossom and Cargo Muchacha a number of men are employed; also at various other places on the desert. The Buena Vista mine, near the river, twenty miles above Yuma, is patented and is the property of the Beaties, who are at present erecting a new stamp mill.

According to the *Express*, J. H. Carpenter of Yuma, A. T., who is manager and agent of the Denver capitalists who bought some mines in the Picacho district, will build a 200-stamp mill and a narrow gauge electric railroad to carry the ore from the mine to the mill, on the Colorado river. The veins developed are from 20 to 150 feet in width, averaging from $6 to $8 a ton. It is the intention to burn crude oil.

### Shasta.

(Special Correspondence.)—Hart's Texas and Georgia keep twenty stamps dropping steadily. The Quartz Hill folks also run twenty stamps steadily. The Central is being exploited by R. G. Hart, who intends working the ore in his mill if it is found in paying quantities. Up at French Gulch the work on the Tom Green has been unsatisfactory to date, and the force is laid off. Ellery Brothers have their mine bonded and a sale about consummated. The Gladstone is shut down; no ore in sight and bills unpaid, with little hope of starting again. At Middle Creek, W. P. Miller is again letting contracts to haul ore to his ten-stamp mill. The Tellurium and the new-process men are trying to adjust their claims in court. Deakin and Taylor are sinking on the old Spanish mine near Shasta. It keeps their steam pump busy to handle the water. They are now down 140 feet, and have four feet of ore that mills $8 per ton. The large placer ditch of the Denver Company at Muletown has been filled with water the last two days, and they are piping off a little ground. When the ditch is completed, a water supply will be insured the whole season.

*Searchlight:* From eighty to one hundred tons of ore are transported daily from Iron Mountain to Keswick, where the smelter is located. About 125 men are employed about the mine proper. Four Burleigh drills are rapidly making headway in the drifts. The men work on eight-hour shifts. Two drifts are at present being run into the great ore body, each 12 feet in width. At Keswick the smelter was closed down for several days last week, and it is rumored that it does not come up to anticipations. General Superintendent Hill visited the big copper smelters at Anaconda, Mont., on his way to London, it is expected for the purpose of comparing the various methods employed.

The *Free Press* hears that R. G. Hart, in his Texas mine, is at work 240 feet below the fifth level. The ledge is from six to ten feet in width and the ore is remarkably rich in free gold. The mill and chlorination works are running steadily to their full capacity. In the Central group, which he controls, a tunnel is being run on the Little Shasta. Considerable development work and much repairing and retimbering is being done in the other mines of this group.

*Free Press:* The Snyder, Last Chance, Little Blossom, Ridge, Old Judge and Clipper mines, near Kennet, Backbone mining district, are sold to Alfonso di Nola, William Axford and James Barron of San Francisco for $7250. They intend to resume work.

### Siskiyou.

*Journal:* The old Allen ledge in Quartz valley is now in operation, and the results are very satisfactory. There is a five-stamp mill on this property, and the machinery is all first-class. It is said that the only hoisting works in the county are on this quartz ledge, and the whole is operated by compressed air. The ledge runs from six to twenty inches in width and pays exceedingly well.

Culver & Co., at the mouth of Barkhouse creek, are sinking their shaft and are making splendid progress.

Vogan and Mathews have bought the Classic mine on Indian creek, near Happy Camp. They have over 300 acres of ground and an abundance of water the year 'round.

At the Spengler mine, at Lower Humbug, the Spengler Brothers intend to open ground in the creek near its mouth at Klamath river.

Howell & Brown are drifting through bedrock at Spring gulch, on Yreka Flats, with expectation of striking a rich back channel.

At the Katie May mine, on Greenhorn, they are running a tunnel on the ledge and have taken out several tons of rock, and a larger amount than usual will be taken out before the next crushing, which will probably be some time in April.

Rills & Young are operating their mine on New York gulch, Indian creek. The ledge is from twelve to twenty inches in width, and the rock has been running from $30 to $40 a ton.

### Trinity.

*Journal:* New machinery has been purchased for the Strode Bros. mine near Trinity Center.

M. Ramin at Deadwood has been working a lease from the Brown Bear Company, near the old Diener works, and has a six-inch ledge carrying rock that is estimated at from $100 to $500 per ton.

Near Trinity Center there are sixty men encamped about the property which the Berlin syndicate recently purchased of J. F. Lyons, awaiting the beginning of operations, and hope to secure employment.

C. Ralston is ground sluicing on Fisher gulch. Place & Wardell have opened a placer mine on Raery gulch. Burger & Hamberger are running a drift mine.

### Tuolumne.

*Independent:* A rich body of ore has been struck in the Tibbitts & Green mine, above Columbia.

"C. H. Swain will open up the old Confidence mine, putting in pumps that will pump 450,000 gallons of water every 24 hours."

### Yuba.

Snell and Walrath at Brown's Valley assume charge of the Hibbert & Burris quartz mine, owned by a San Francisco company. There is now a shaft down 140 feet, and after this has been pumped out sinking will be resumed.

## NEVADA.

### ESMERALDA COUNTY.

The *Miner* says there is hope that Aurora will boom again. An English company contemplates making a move there on an extensive scale. Nothing more than surface work was ever done in the camp and the yield was millions.

### LANDER COUNTY.

The Austin Mining Company will shortly put up a 60-ton mill at Austin, at the mouth of the tunnel, which is now in 5000 feet, and will be driven 1500 feet farther.

### LINCOLN COUNTY.

The Phœnix Reduction Co. at Bullionville has already, says the Pioche *Record*, put through over 300 tons of the Condor tailings. The material, which has been accumulating for years, is said to be yielding reasonably good results, yet not as well as expected, and a new process is to be introduced. The chief difficulty is to thoroughly work the slimes, which, though of comparatively high grade, are so fine as to resist all ordinary efforts at leaching, etc., and this is the main reason why a very large quantity of the Bullionville and Dry Valley old tailing pits have never been successfully handled.

### ORMSBY COUNTY.

F. C. Everett of Wellington is running a 120-foot tunnel on a new mine near South Camp. He calls it the Feverish Hornet. The ledge averages three feet in width, and assays show a value of $15 a ton. He has a five-stamp mill at Wellington, but says he intends to put up a new and better mill immediately.

### STOREY COUNTY.

The addition to the Kinkead mill is now completed, and in a few days the two new grinders will start up.

### WHITE PINE COUNTY.

*Tribune:* David Wood says that since the agitation of the railway new life has been infused and that the developments of 1896 promise gratifying results. At Osceola there is much activity at the present time, the Columbia Co. having resumed work on an energetic scale. Cherry Creek is another camp that is touched by the projected route. There silver predominates, and but for the depression in that metal there is no doubt but Cherry Creek would to-day, as in years long gone by, be contributing to the wealth of the nation.

Ely and White will be, according to the preliminary survey, also on the lines of the new railway.

The great obstacle in the way of successful mining in the camps mentioned, says Mr. Wood, is the lack of fuel. The forests have been devastated, and with the exception of clumps of dwarf cedars here and there but little is left those plucky people who have remained in the country, notwithstanding the hardships that lead and silver have sustained. Mr. Wood says that as soon as dirt begins to fly on the new road ore will begin to pour from the mines of the old Nevada camps, and that those who have struggled there during the day of hard times will contribute as much to the earnings of the new line as will those of any other country through which it passes. He brings with him samples of ore running very high in silver, copper and gold, and says there is plenty of it.

## OREGON.

### BAKER COUNTY.

The Colorado & Oregon Gold Mining Company of Denver has bought the Don Juan and Dodo mines, Robinsonville district, owned by Kelly Bros. & Allen, for $50,000. The new owners will build a 10-stamp mill.

E. B. Jones of Utah, has bought a gold claim twelve miles from Baker City and two miles north of Pleasant valley. The vein varies from 3½ to 20 feet between walls, with porphyry on the hanging and quartzite on the foot. In the development of the claims a tunnel has been driven into the hill 165 feet, at which point the vein was intercepted at a depth of 180 feet from the surface. Upon this the management upraised to the surface, while crosscuts have been run 150 feet in one direction and 100 feet in another. A winze has been put from the floor of the tunnel to a depth of fifty-seven feet. Jones estimates that there are now 15,000 tons of ore in sight, the value of which ranges from $10 to $16 a ton and that amalgamation has demonstrated that 81 per cent of the values contained in the ore may be saved through it.

W. J. Clarke of Helena, Mont., and J. E. Searles of New York, have bought the Last Chance mine, Cornucopia district for $150,000.

### LANE COUNTY.

The Hammond Manufacturing Co. of Portland has taken a contract to build a 20-stamp gold amalgamating and concentrating mill, with electric power, on the Annie mine in the Bohemia district, Cottage Grove. This is the largest mill contract ever let in Oregon, as the weight of the stamps is 1000 pounds, with all other appliances to correspond. The electric motors are to be run by water taken from a mountain stream four miles distant from the millsite where this plant is to be put in operation. The Hammond Co. built last fall a 10-stamp mill on the same ledge, which is owned by the Champion Co., and which is now about to start up, having been shut down for some time on account of snow. The mill built last fall was taken over a long, steep trail, as illustrated herein. It is expected to start the mill June 20th. P. J. Jennings is the superintendent.

## BRITISH COLUMBIA.

The British Columbia Minister of Mines reports mining development of 1895:

In Alberni 141 mineral claims were recorded; development work is going on in the Mineral Creek group, exposing several veins of free gold, the most noted being the Alberni, Missing Link, Mountain Rose, Champion, Ace of Spades and Last Dollar; average assay about $30 per ton.

Quartz mining in Cariboo district is in statu quo, notwithstanding that there are perhaps as many mineral claims held under record at the present time as at any previous date. Hydraulic mining is now assuming vast proportions in the district, not as carried on in the early days, with the use of canvas hose with a small pipe and monitor, with perhaps a two-inch nozzle and 100 feet of pressure, but upon a more extensive scale, similar to the works in operation at the Cariboo and Horsefly mines. There are now about thirty leases of hydraulic ground held on the Quesnelle river, where two years ago there were but five. River dredging is reported as beginning to assume tangible shape and will begin on both the Fraser and Quesnelle rivers in the spring. Gold has been found in paying quantities on Pine and Summit creeks, about six miles northeast of Barkerville, and several thousand dollars taken out during the season. The report closes with a description of the hydraulic elevator process of working creek diggings. Cassiar and Lillooet have not contributed anything worthy of especial mention.

For East Kootenay the report opens with

the statement that 80 per cent of the output of placer gold has been recovered by Chinamen. After estimating the output of gold, it proceeds: Mineral claims have this year, for the first time, become productive in reality. A large quantity of ore is now awaiting the operating of navigation for shipment to smelters. The demand for means of transportation has resulted in the commencement of two new steamers and the enlargement of a third to ply on the Kootenay river. There has been a large increase in the number of prospectors in the southern part of the district.

For West Kootenay, beginning with the Slocan recording subdivision, a number of the leading properties are specifically mentioned and their development traced through the year. The Slocan Star, Noble Five group, Reco group, Deadman, Goodenough, Last Chance, Payne group, Mountain Chief, Maid of Erin, American Boy, Washington, Surprise, Antoine, Ruby Silver, Alta, Best, Rambler, Dardanelles group, Slocan Boy, R. E. Lee, Mountain Chief No. 2, Ruth, Lucky Jim, Ivanhoe, Ruth, Carnation, Eureka, Richmond, Currie, Alpha, Adams, Bradshaw, Beethoven, Elkhorn, Alamo, Idaho, Cumberland, Sunshine, Yakima, Enterprise and Slocan Queen, Mattawa, Kalispell, Howard Fraction and the Exchange.

The report then proceeds: Ore can now be taken from Sandon and other points and delivered at Pilot Bay for $4 per ton. This rate enables the small producer to get his ore out at a small cost and to receive quick returns.

Prospecting during the year has been principally confined to Springer creek, Lemon creek, and their tributaries. A great number of claims have been staked on red quartz lying in the granite. Upon assays being made this red quartz was found to contain native silver and in several cases gold. Prospectors who have been through to Kootenay inlet, from the foot of Slocan lake, have found a comparatively easy route and estimate the distance across to be twenty two miles. Three hundred records have been made from this part of the Slocan subdivision, one concentrator completed and two are under construction. It is confidently expected that 30,000 tons of ore will be shipped from this subdivision during the year 1896.

In the Ainsworth subdivision development work has been done chiefly in the dry ore belt lying between Whitewater and Jackson creeks, Jackson basin and the White Grouse mountain country. Claims have been tested in the Duncan river, East river and Howser lake sections. From these sources about 2000 tons of ore have been sent to the United States and 200 tons to Pilot Bay.

At Ainsworth proper, since the early part of the year, several mines have been working and shipping ore to Pilot Bay. Among these are the Skyline, Number One, Lady of the Lake, Dillie, Mile Point, Highlander and Canadian Pacific Mining Co., while the Little Phil and Black Diamond have sent out 349 tons to the United States.

The Pilot Bay Smelter works were complete enough to commence the treatment of ores in March last. The first shipment of bullion was made March 16, 1895, and from that date to Dec. 30, 1895, 3220 tons of silver-lead bullion have been shipped.

The Nelson subdivision opens with a description of the Hall Mines' properties. Development work during the year has been chiefly confined to the Silver King mine. The company estimates the amount of ore in sight in the various workings at 120,000 tons. An aerial tramway has been erected from the Silver King mine to the smelter at Nelson, a distance of four and one half miles. This line is supplied with 85 buckets of a combined delivering capacity of 10 tons per hour. At Nelson a one-stack water jacket smelter with a daily capacity of 100 tons has been erected. By this method the ore is concentrated into a matte and, on a basis of reduction of seven tons into one, the matte should have a value of 300 ozs. silver, 45 per cent copper and one-half ounce gold per ton. This refers to the low grade ore at present being transported from the mine dump. The sampling mill is supplied with crushers, rollers and samplers and has a capacity of 100 tons daily. It is the intention of the company to build a roaster in the spring in connection with their works and possibly add another stack. This would more than double the capacity, and enable the company to treat outside ores. The company has expended during the year about $140,000 and 100 men are steadily employed.

Other properties mentioned are the Dandy, Grizzly Bear, Ivanhoe, Iroquois, Starlight, Princess and Fern group. A number of gold locations have been made in the belt lying south of Nelson. Placer work has been chiefly confined to Forty-nine creek. There the Nelson Hydraulic Co. made a cleanup of $4000.

In the Trail Creek subdivision of the report the following items are of interest.

The value of the ore produced in this subdivision in 1894 was about $125,000, in 1895 it exceeded $1,000,000, while in 1896 it is estimated that it will be from $3,000,000 to $5,000,000. The railways operating in the subdivision in 1894 were the Nelson & Fort Sheppard railway and the Columbia and Kootenay railway. Now, at Trail, a narrow gauge railway is in course of construction, for the purpose of connecting that town with the mines at and near Rossland.

The War Eagle and the Center Star Companies have announced their intention of erecting smelters of their own at or near Rossland, which will together have a capacity greatly in excess of that built at Trail. It is almost certain that two more railroads will be built into Rossland during the coming year—the Red Mountain road, from Northport, Wash. (a branch line of the Spokane Falls & Northern), and a branch of the C. P. R. from Robson. About forty miners were employed in the shipping mines of Rossland in the winter of 1894-5. About 500 men are now at work in the same localities. During 1894 no properties were being worked except the Le Roi, War Eagle, Josie, Nickle Plate and O K, all situated within a short distance of the town, except the last named, which is about one and one half miles west. Throughout 1895, and at the present time, dozens of mines are employing men, ten or fifteen of which can ship ore, if they desire. These mines lie in all directions from Rossland, and some of them across the Columbia. Properties outside the immediate vicinity of Rossland are probably employing 200 men at the present time.

Reports of a more or less encouraging nature from the minor districts complete the document.

The output in the various districts is estimated as follows:

| | |
|---|---|
| Trail ... | $ 1,000 |
| Caesar | 22,575 |
| Lardeau .... | 4,000 |
| East Kootenay placer gold | 15,750 |
| East Kootenay silver-lead ore | 255,270 |
| West Kootenay ore and placer gold | 25,000 |
| West Kootenay gold, silver, lead, copper ore | 2,475,000 |
| Yale placer gold ... | 48,148 |
| Osoyoos, placer gold .. .. | 12,500 |
| Total output ..... | $2,907,221 |

### IDAHO.

At Burke the Peorman-Tiger has rigged up one of the boilers of the burned Peorman mill and is using it to help run the pumps.

At Gem the recent increase in water has given the Gem ample power to run its hoist, and it is again working a full force of 125 men. The Frisco is also running full blast.

The new flume taking water out of Canyon creek, midway between Burke and Wallace, for the Standard mill, is being pushed to completion. The water will be used to run a dynamo and the power thus generated used to run the drills in the Standard tunnel and in such other ways as may be profitable.

The Florida Mountain Mining Company of Pittsburg, Pa., will erect a twenty-stamp mill at Boundville this spring. W. H. Dewey is the manager.

### UTAH.

The *Tribune* says there has never been a period in the history of the Ontario Mining Co. when its ground was more productive. During eight days in the present month the mine produced 46,430 fine ounces of silver, and to-day exposes larger ore bodies than at any time in its history.

The Daly Mining Co. is making a very pretty record the present month, the bullion record for ten days showing 38,053 fine ounces silver, while the output continues steady. It is estimated that in the treasury at the present time is nearly $400,000, the last statement made by Supt. R. C. Chambers showing cash and product that has since been settled for amounting to $330,000.

The *Tribune* says: W. Quigley, who, with his associates, has put nearly $60,000 in a Chicago plant for the handling of Utah pumice stone, has closed a contract for the entire output of the deposits in Millard county for the next year. He reports the plant in Chicago now complete. It is 345 feet in length and from two to four stories in height, and has a capacity for handling from 10,000 to 12,000 tons of stone a year. Its mechanical features are perfect, a dryer having been put in at an expense of nearly $7000, while the whole has a capacity for turning out the stone in eight different grades. A sawing plant has also been erected, through which the rock is converted into bricks of all sizes, and which are in use for scouring purposes. With these it is proposed by the company to do away with the imported article, in which Mr. Quigley says there is not an atom of pumice, and the industry promises to become one of the most important in America. The imported article now sells at the rate of 6 cents a pound, wholesale rates; the powdered at 1¼ cents, and the material in brick form at 6 cents a pound. In the contract with the owners of the deposit it is agreed that they keep at all times 100 tons in readiness and that they will be prepared to deliver that amount on demand.

(There are pumice stone deposits in Shasta, Modoc and Sonoma counties, this State, but the lack of transportation facilities and commercial demand has so far kept them from being worked.)

### MONTANA.

*Inter-Mountain*: A Boston authority claims that the Boston & Montana will this year pay $8 per share in dividends and carry a million to the surplus account. It should be understood that the management of the Boston & Montana and of the Butte & Boston has always been entirely different. The former is now quoted at $80 and the latter at $2. It is the general belief in Butte that the Butte & Boston has some fine properties which the receivers will successfully open. It was the management, and not the mines, that caused the collapse.

### SOUTH DAKOTA.

DEADWOOD-TERRA RESULTS.—The Deadwood *Times* says that since work was resumed on the Deadwood-Terra mine a year and a half ago, the 160-stamp mill on the property has treated 500 tons of ore per day of an average value of $1.78 gold per ton, at a profit of $6000 per month, the entire cost of mining and milling the ore being $1.38 per ton. The last report of the Homestake Company on their other properties gives the average value of ore at $4.68 per ton and the cost of treatment at $2.68. The Deadwood-Terra was for a long time shut down, as the mine did not pay expenses, and when work was resumed the miners agreed to work for $3 per day, while other properties pay $3.50.

Black Hills *Times*: At the Deadwood-Terra M. Co., since work was resumed in the mine about a year and a half ago, after a long shutdown, the mill (160 stamps) owned by the company has treated on an average 500 tons of ore per day, the average value being $1.78 gold per ton, yet out of this low-grade material a profit of $6000 per month has been made and put aside for dead work. The last report of the Homestake Company, June, 1895, shows the average value of the ore treated for the preceding year to have been $4.68 per ton, while the cost of reducing it was $2.68 per ton. Owing to the low grade of ore in the Deadwood Terra, the men now at work in it agreed to a reduction of 50 cents per day in order that the mine and mill could resume and continue in operation. The cost of milling ores here in the Black Hills ranges from 40 to 75 cents per ton. A twenty stamp mill can treat ores at from 40 to 60 cents at the former rate where a water right is owned by the milling company, and at the higher rate where the necessary water has to be purchased.

### WYOMING.

At Green River the Green River Fuel Company is boring for oil as reported to have struck at a depth of 620 feet a most pure sodium carbonate. The value of this carbonate is not less than $25 per ton, as it crystallizes by natural evaporation.

A local paper says excitement over the discovery of tin ore in the Big Horn mountains, near Sheridan, continues. "Assays show an average return of twenty four pounds of pure tin to the ton. Manager Holdredge of the Burlington Railway has interested himself in the discovery to the extent of employing an expert mineralogist to make a report on the property. Upon this report will depend the erection of mammoth reduction works at or near the mines. The ore exists in immense quantities. The vein is perfectly defined, and is from 60 to 75 feet in width between granite walls and extends for a distance of four miles."

The Green River *Star* says notices of location covering thirty-two mineral claims about Green River have been filed. C. F. Davis, a Union Pacific civil engineer, is among the locators. Over 5000 acres of mineral land have now been filed upon in that vicinity.

### COLORADO.

*Mining Industry and Review*: The Colorado and Philadelphia Reduction Company has formed and $350,000 subscribed for the purpose of building 250-ton reduction works at Colorado City, between Colorado Springs and Manitou. The directors of the company are Charles L. Tutt, Spencer, Penrose, C. M. McNeill, George W. Pierce, of Denver, and Wendell B. Bowman, of Philadelphia. Mr. Pierce is heavily interested in the Golden Fleece mine. Messrs. Tutt and Penrose are heavily interested in Cripple Creek and are at the head of the Cripple Creek sampler, and Mr. McNeill is a practical millman and is interested in the Victor samplers. It is proposed to begin work immediately with the expectation of completing the plant within five months. The process to be used is chlorination.

The Lamartine tunnel, constructed to drain the Lamartine mine, which has produced over $3,000,000, was finished March 28. The tunnel is nearly a mile long and cost $60,0000.

### NEW MEXICO.

The Silver City Smelting and Refining Company is incorporated; Geo. S. Cartwright, secretary and treasurer; S. E. Bretherton, general manager.

Las Vegas *Optic*: The Washington mine, in the Cochiti mining district, has nine cars of high-grade ore on the track and will ship this week to smelters. Some of this ore runs as high as $500 per ton, mostly gold. The Albemarles mine, Cochiti district, has two cars on track to ship to smelters, also. These two mines will be steady producers now and will ship from six to ten cars per week. There is a rich strike in the Santa Rosa, in Peralta canyon, of ore carrying gold, silver, copper and lead, assaying over $400 per ton. Other strikes are constantly being made of from $10 to $40 ore, all over the district.

### ARIZONA.

Mr. Davies, a Chicago capitalist, has bought the Silver Trial mine, in the Hassayampa district, Ariz., the ore from which is said to mill $75 per ton. The mine has been worked at intervals for a long time and is developed by about 1000 feet of work. The new owner will have a road built to the mine, erect a ten-stamp mill and make the property a producer.

### WEST AUSTRALIA.

Several California papers are giving constant insertion to an advertisement telling California miners how they can quickest get to Coolgardie. Chas. Taylor, a Montana miner, writes from the Broad Arrow district: "Of all the God-forsaken places, this is the worst, although without doubt it is going to be the greatest gold-producing district in the world, when a good railroad is built to haul the ores to the sea. The place is simply a howling desert as yet; water sells for 25 cents a gallon, and every drop of it is condensed. It costs me $5 a day for my horse in water alone. Living is very high; eggs 25 cents each, potatoes 30 cents a pound, and nothing but canned meats to live on. Freight from the present terminus of the railroad (seventy miles) is $175 per ton. Water at the terminus for the freight horses and camels has to be hauled 300 miles on the cars, and when I passed there over 1000 horses and 500 camels were waiting for a drink; some of the horses did not have a drop for three days, and were dying by the score on account of hot weather and no water. The thermometer averaged from 100° to 117° in the shade for the first ten days I was here, and the dust was simply frightful; for forty miles we could not see the leaders on the coach, and now I almost wish I was back again in Butte. I have a lot of traveling around to do, so I have a good chance to see the different mines, and there are some splendid ones, but they cannot do any crushing on account of no water. The Hill-End mine, adjoining one of the properties I am in charge of, has two 3-stamp prospecting mills, crushing three tons a day, paying $525 in gold. Their water costs them $6000 a month. Another mine—The Great Boulder—running five stamps averages $125 through eight feet of ore. The only solution will be a good railroad, as there is no fuel nor mining timber and absolutely no water. I am going out to look at a copper property, seven feet wide, 60 per cent copper and two ounces gold per ton."

### NEW SOUTH WALES.

Sydney authorities have a practical way of dealing with their unemployed. They give a railway pass and a miner's right of credit to each suitable applicant, which enables him to proceed to one of the gold fields owned by the county government, where he may have a chance of earning his living by "fossicking." The number of passes issued in 1894 was 9,572, and since the inauguration of this scheme the quantity of gold obtained in the colony has risen from 179,288 ounces in 1893 to 324,787 ounces in 1894.

### SOUTH AFRICA.

South African *Mining Journal*: Managers report that natives are becoming less efficient in the mines, the amount of work done per man being less now than it was a few months ago. In one case it is found that 900 boys are now required to perform the work for which 600 were formerly sufficient, and the complaint is general that this is not an uncommon case. It is stated that one of the chief causes why the boys have deteriorated is the neglect of the white overseers to properly supervise the gangs under their care, causing the boys to become careless and lazy. This want of supervision is partly due to the disturbing effects of recent events, which have to a certain extent demoralized the white labor, and the native has taken advantage of this to limit the amount of work done by him. Many instances have occurred recently of neglect of duty by white miners, and in one or two mines managers are casting about for new methods which will make them less dependent upon the supervision of the latter. It has often been pointed out that the white refuses to work in South Africa, and the men upon whom the actual work of superintendence falls are no exception to this rule, but very frequently shirk their work.

## Additions to the State Mineral Collection.

The following are some of the recent additions to the mineral collection of the State Mining Bureau:

Opal.—Douglas county, Washington. M. Braverman.

Green Muscovite crystals.—Lincoln county, North Carolina. M. Braverman.

Aragonite (onyx marble).—Lake county, near Zem Zem, in Napa county, California. Mr. Gilbert.

Feldspar crystals.—Nye county, Nevada. Hon. A. T. Hatch.

Marbles.—Six polished specimens from the Walker river quarries, Mono county, California. E. W. Lindsey.

Granite, occurring in thin slabs, coated on one side with molybdenite, and on the other side with chalcopyrite and bornite.—Skykomish, Washington. M. S. Davis, per G. F. Davidson, C. E.

Talc, showing free gold.—Red Point mine, Washington district, Nevada county, California. Wm. Yeaw.

Very large Indian stone pestle—Susanville, Lassen county, California. T. B. Sanders.

White talc, thought to be suitable for industrial purposes.—Perris, Riverside county, California. Frank Mott.

Native sulphur.—Geysers, Sonoma county, California. J. Z Davis.

And sundry other specimens, ores, etc.

HENRY S. DURDEN, Curator.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING MARCH 24, 1896.

556,859.—CAN-WIPING MACHINE—A. Corruti, S. F.
556,961.—FIRE ESCAPE—G. W. Cleveland, Little Rock, Wash.
556,974.—WINCH—H. Ekrem, San Pedro, Cal.
556,741.—REFRIGERATOR—J. V. Frost, Los Angeles, Cal.
556,816.—BINDER—E. S. Glover, S. F.
556,982.—FLY CAGE—D. K. Howe, Portland, Or.
556,826.—FRUIT-DIPPING APPARATUS—Lynam & Russell, San Jose, Cal.
557,080.—CULTIVATOR—A. J. Morley, Chula Vista, Cal.
557,028.—CAN CRIMPER—H. Schaake, S. F.
557,029.—CAN DRIER—H. Schaake, S. F.
556,778.—HORSESHOEING STALL—J. E. Schneider, Lancaster, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

## Washington State Incorporations.

The following companies incorporated in the State of Washington last week:

Macrina Mining and Milling Company, Ellensburg; capital, $250,000; W. Lewis, C. H. Flummerfelt, G. A. Swain, trustees.

Aragon Gold Mining Company, Spokane; capital, $500,000; G. Turner, A. Brown, A. L. Davis, C. H. Wolf, F. L. Williams.

Wheeler Company; general mining business; Seattle; E. K. Davis, R. M. Davis.

Gray's Harbor and Northern Railroad Company; capital, $50,000; Hoquiam; G. H. Emerson, H. C. Herman and C. A. Congdon.

The '95 Mining Company, Everett; capital, $200,000; S. Vestal, J. McRae, P. Ligne.

MR. HIRAM S. MAXIM has consented to write a series of important illustrated articles on the evolution and manufacture of automatic firing guns, the first of which appears in the current issue of *Industries and Iron*.

## Coast Industrial Notes.

—Redwood lumber dealers have organized and advanced the price $1 per M.

—The total southern California orange crop is 3,200,000 boxes, of which 2,400,000 boxes have been shipped.

—James Touhey has a $60,000 contract for paving the streets around the Capitol building at Sacramento.

—A company is organizing at Kingman, Arizona, to build electric lines to the mining camps in that vicinity.

—The San Francisco Terminal Company proposes a cantilever steel bridge built between San Francisco and Oakland.

—The British Columbia salmon pack last year was 566,395 cases—72,024 more than in 1894; 22,834 less than in 1895.

—At Mare Island two twenty-eight-foot steam cutters are building for gunboats 14 and 15, being built at the Union Iron Works.

—The electric line from Los Angeles to Santa Monica was formally opened last Thursday. It is an extension of the Pasadena road.

—Dogs are at a premium in western Washington by reason of the Alaska demand. A good sized canine of any breed is now worth $20 in Seattle.

—From St. Helena a wine sale is reported of 200,000 gallons to C. Schilling & Co. of San Francisco, at 20 cents per gallon, the highest price obtained for years.

—It is about decided that the stone for the Union depot building at the foot of Market street, this city, will be from the Sites quarry, Colusa county, Cal.

—Nearly sixty miles of the San Joaquin Valley road are now in operation. Track is being laid southward toward the Merced river at the rate of two miles a day.

—The Seattle, Lake Shore and Eastern Railroad will be sold under foreclosure proceedings on May 26th by Chancellor Eben Smith at Seattle, Wash. There is an indebtedness of $6,000,000 against the road, which is 227 miles in length.

—The Market-Street Railway Company of this city declared a 60-cent dividend for the three months ending March 31st, being about 5 per cent on the present value of the stock—$47 a share. The number of shares on which this dividend is paid is over 180,000.

—The new board of directors of the Manufacturers' and Producers' Association met last Tuesday and discussed the proposed autumn exposition of home products. It is thought some mutual arrangement can be effected with the directors of the Mechanics' Institute.

—The Navy Department has set May 10th as the date, and the Santa Barbara channel as the place, for the official trial of the battleship Oregon. The vessel will be required to make fifteen knots. For every quarter of a knot over that rate the Union Iron Works will get a premium of $25,000.

—The Northern Pacific Railroad will do more sluicing along the main line in the Cascades, Washington, this season than ever before, and seven bridges between Easton and Weston will be filled beneath. These bridges run from 50 to 80 feet in height, and are 400 to 500 feet in length. Work will begin the middle of April and continue as long as water for sluicing is obtainable in the mountains.

—The Southern Pacific Railroad Company is reported to be preparing to ask a rehearing before the United States Supreme Court in the suit in which the right of the State of California to tax the franchises of the Southern and Central Pacific roads was last week affirmed. The effect of the decision was to compel these two roads to pay to the State in taxes for the year 1887 the sum of $750,000.

—Patents were granted last Tuesday to George Armstrong, San Francisco, mold for pipe covering; Martin P. Boss, San Francisco, boiler; Charles A. Conger, San Francisco, buckle; John F. Daly and W. L. Corson, San Francisco, gas engine; Henry P. Holland, Oakland, ore crushing mill; Leitz Adolph, San Francisco, mathematical instrument; August H. Scherholz, San Francisco, air valve for water pipes; Benjamin E. Stevenson, Redding, wagon jack; Henry S. Wood and R. S. Perry, San Francisco, dredging apparatus.

—The terms upon which an American company will be permitted to land a cable on the Hawaiian islands are embodied in an act passed by the Hawaiian Legislature last August. Upon application from Col. X. Z. C. Spaulding, the Hawaiian Legislature offered to let him land a cable on any of the islands and in addition give him a subsidy of $40,000 a year, providing he should obtain an equal subsidy from the United States Government. Other minor stipulations were mentioned, including a certain number of Government messages which should be transmitted without cost. Under the terms by which the United States Government obtained the use of Pearl harbor as a coaling station, it is said that this Government has a right to land a cable at that point.

—A Nevada stockman who has been experimenting, says beef cattle driven twenty-five miles without water will shrink fifty pounds per bullock, allowing feed and drink at the end of the journey before weighing. A bullock driven five miles and allowed to stand two hours without feed or water will not shrink any. A bullock driven fifty miles and allowed to drink frequently during the drive will shrink twenty pounds. A bullock driven twenty-five miles and allowed to drink frequently during the drive will not show shrinkage, if allowed to eat and drink for three hours at the end of a drive. A bunch of 600-pound bullocks driven fifty miles with care and allowed to drink frequently on the drive and at the end allowed to eat and drink for six hours, showed fifteen pounds shrinkage to the animal.

—The International Pacific Railway Company has incorporated at Topeka, Kansas, to construct a railway from Guaymas, on the Gulf of California, in Sonora, Mexico, northeast 115 miles, to Barranca. The road will be tributary to the mines in Sonora and Chihuahua, which it proposes to develop. The charter also provides for building a line north to the boundary line of Mexico and the United States at Bisbee, Arizona, and on to a connection with the Atchison and Southern Pacific at or west of Deming, N. M. The mines in the Sierra Madre mountains are rich, but are inaccessible, and little is known of them. The famous "Boss Shepherd" mine is in the district. H. T. Richards, who is one of the promoters of the enterprise, was formerly assistant general manager of the Sonora railway, a branch of the Atchison system, for several years and is personally familiar with the resources of Sonora.

## Personal.

DR. SCHIEDEL is at present sojourning in Coromandel, N. Z.

F. H. LE BONTE will superintend development work at the Bell group, Sunny Hill, Shasta Co.

GEN'L MANAGER HILL of the Mountain Mines, Limited, Shasta Co., is visiting the Butte smelters.

A. J. SHOEMAKER succeeds H. A. Kellar this week as superintendent of the Parrott, Montana, smelter.

SUPT. F. BRIGHTMAN of the Gladstone, French Gulch, Shasta Co., expects to shortly resume operations there.

JNO. HAYS HAMMOND has been permitted to leave the Transvaal on account of his health. His bail was increased to £20,000, and he is at Capetown. The other arrested members of the committee are still under guard at Pretoria.

MILTON B. CASE, who claimed to be the owner of a one-third interest in the Comstock, Virginia City, Nev., died at Grand Junction, Colo., last Friday. He claimed that Comstock sold him half of the claim which afterward made several millionaires for $700. Later Mackay was given a third interest for $15. Case lost his portion of the property before its great value was established.

## Commercial Paragraphs.

E. A. BROOKE RIDLEY, 10 Front street, agent Siemens & Haiske Electric Co., has a rotary electric drill that is claimed to successfully meet the objections heretofore urged against drills of this class. A flexible shaft is applied, which, with an automatic feed arrangement, gives increased efficiency.

GEO. E. AMES of the Union Iron Works has returned from Butte, Mont., where he contracted with the Anaconda Copper Mining Co. to supply them with two hoisting engines, thirty-two inches diameter of cylinder, seventy-two-inch stroke, steam-jacketed, automatic cut-off, clutched brakes, and reversing gear actuated by steam, overwinding preventive, including the latest improvements. The shipping weight will be about four hundred thousand pounds.

THE Chicago *Journal of Commerce* says: "Robert W. Hunt & Co., 1137 the Rookery, Chicago, are inspecting the construction of 150 cars at the works of the Ensign Manufacturing Company, Huntington, W. Va., for the San Francisco & San Joaquin Valley Railroad Company."

## Literary Note.

The General of the Army, the General commanding the U. S. Corps of Engineers, Vice-Pres. Webb of the New York Central and John Jacob Astor compose *The Cosmopolitan Magazine's* Board of Judges to decide the merits of the horseless carriages which will be entered in the May trials, for which *The Cosmopolitan* offers $3000 in prizes. This committee is undoubtedly the most distinguished that has ever consented to act upon the occasion of the trial of a new and useful invention. The interest which these gentlemen have shown in accepting places upon the committee is indicative of the importance of the subject and that the contest itself will be watched with marked interest on both sides of the Atlantic.

## Recent Mining Dividends.

THE Ontario, Utah, mine paid a 10c per share dividend, aggregating $15,000, on the 31st ult.

THE Morning Star Mining Company, Colfax, declared a dividend, No. 64, of $4 per share on the 30th ult.

THE Napa Con. Quicksilver Mining Co. paid a quarterly dividend of 10c per share, or $10,000, last Monday.

## Recent Mining Incorporations.

Savannah Mining Company, San Francisco; directors, L. H. Sharp, I. R. Hall, A. E. Bolton, C. L. Hovey, R. H. McGowan; capital stock, $500,000.

### A Change of Name.

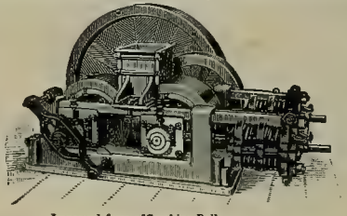
The name of the *Pacific Coast Bullion*, published in Los Angeles, Cal., has been changed to *The Mining and Metallurgical Journal*, the proprietor's reason for changing the name being that the old name never fully conveyed the proper idea of the subjects treated or the territory covered.

METALS PERFORATED AS REQUIRED FOR

**MINING SCREENS OF ALL KINDS**

AND FOR USE IN

| | |
|---|---|
| Milling and Mining Machinery | Stone, Coal and Ore Screens |
| Reduction and Concentrating Works | Stamp Battery Screens |
| Woolen, Cotton, Paper and Pulp Mills | Brick and Tile Works, Filters |
| Rice, Flour and Cottonseed Oil Mills | Spark Arresters, Gas and Water Works |
| Sugar and Malt Houses | Oil, Gas and Vapor Stoves |
| Distilleries, Filter Presses | Coffee Machinery, etc., etc. |



Standard Sizes Perforated Tin and Brass Always in Stock.

**Main Office and Works: 222 to 240 North Union Street, Chicago, Ill., U.S.A.**
Eastern Office: No. 284 Pearl Street, New York

ESTABLISHED 1860. **COLORADO IRON WORKS** INCORPORATED 1876.
MANUFACTURERS AND BUILDERS OF
**Smelting Plants of All Kinds, Concentration, Cyanide and Chlorination Plants.**

Stamp Mills, Cornish Rolls, Roasting Furnaces, Hydraulic Sizers, Etc.

WESTERN AGENTS FOR ERIE CITY IRON WORKS ENGINES AND BOILERS.

Improved form of Crushing Rolls.

Crushers, Sampling Mills, Screens and Elevators, Sample Grinders, Etc.

WESTERN AGENTS FOR SMITH-VAILE STEAM PUMPS For all kinds of service.

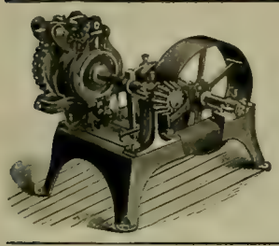
Our stock of supplies for Mines, Mills and Smelters is complete and we are prepared to fill orders on shortest possible notice.
We have an ore testing plant in connection with our works and we test ore in car lots for concentration and amalgamation, and build mills to successfully treat all classes of ores by latest known methods.
OFFICE AND WORKS, 33D AND WYNKOOP STS., DENVER, COLO.

This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee. If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?

Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.



WE make mining machinery of all kinds. We also "make the Miner," that is, Woods' Dry Placer Miner, as illustrated here. Users say it is "really perfect." In writing about it ask for catalogue 51.

Smelters are using our semi-steel moulds, kettles and pots extensively; they give first rate satisfaction. We are also making welded steel water jacket furnaces, better than anything previously produced. Among specialties of our manufacture are perforated metals; also riveted steel pipe for hydraulic lines. You will find us obliging in making estimates and giving particulars, as we aim to serve the interests of our customers in the best way.

**FRASER & CHALMERS**, Chicago, Ill., U. S. A.

2 Wall St., New York; 527 17th St., Denver, Colorado; Salt Lake City, Utah; Helena, Montana; City of Mexico, Mexico.

# Water-Power Governed for Electrical Work.

The limit of government of water-power is often determined by the design and construction of plant Consult us if possible before completing your plans.

With **REPLOGLE'S COMPOUND REGULATORS** we are prepared to undertake and **guarantee** the government of water-power for all purposes, including **Electric Railway. Power and Lighting Plants.** We make and sell all of Replogle's Electrical and Mechanical Governors and other devices for the government of water-power. Expert advice furnished upon application. If results of your present system are not satisfactory write us. Address all inquiries to

PELATAN-CLERICI PROCESS.
Patented in U. S. and Other Countries. Capital, £100,000.
London Head Office.....8 Drapers Gardens.
Laboratory and Ore Testing Plant, 1530 Wynkoop St., Denver, Colo.
This process has a well-demonstrated merit in treatment of low-grade Gold and Silver Ores, especially those of a complex character, talcose and clayey combinations or slimes, which class of ore, as is well known, cannot be treated by leaching or lixiviation.
Gold and silver values, both fine and coarse particles, are by the PELATAN-CLERICI PROCESS recovered direct from ore without roasting as pure amalgam, and the precious metals are saved in the form of fine bullion without any refining costs.
Local Manager for U. S., F. CLERICI.

## Spadone's Concentrator Belts. Patented.

**The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.**

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

## THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

**was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.** MORE THAN DOUBLE THIS CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect; Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury,
Manufacturer,
141 to 143
First St.
San Francisco, Cal.

PATENTED, Aug. 19, 1890.

**This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition, 1893, and at the San Francisco Midwinter Fair, 1895.**

# CHEAP IRRIGATION!

UP TO DATE!

SAVE MONEY BY USING

# THE "DANIEL BEST" CRUDE OIL ENGINE

FOR POWER.

THIS IS WHAT THEY CAN DO:

**Will furnish power for one-tenth of a cent per horse power per hour. It is the cheapest power ever produced, as shown in the following table, and which is based upon a test of ten hours' run with one of our five-horse power Gasoline Engines,** using gasoline (74°), coal gas, common domestic coal oil, crude petroleum, asphaltum base, crude petroleum, paraffine base, as follows:

| | |
|---|---|
| Coal Gas, ten hours' run, 1000 feet | $2 00 |
| Gasoline (74 deg.), ten hours' run, 8¾ gallons @ 14c. | 1 25 |
| Coal Oil, ten hours' run, 7½ gallons @ 10c | 75 |
| Crude Petroleum, asphaltum base, 16 gallons @ 3c | 48 |
| Crude Petroleum (36 deg.), paraffin base, 13 gallons @ 5c | 65 |

On the crude petroleum with asphaltum base we had an over-product of 7 gallons of asphaltum; the market price is 3 cents per gallon—21 cents. This deducted from the first cost of the crude petroleum for ten hours' run leaves a net balance of 27 cents. And from the crude oil with a paraffine base we had an over-product of 3 gallons of good lubricating oil, which we consider equal to any we have ever used, but will estimate its value conservatively at 20 cents per gallon, making 60 cents; this deducted from the first cost of the crude oil leaves a balance of 5 cents, total cost of running ten hours.

It will be readily seen that the operation of these Engines with crude petroleum reduces the cost of operation to a minimum. Crude petroleum with paraffine base at 1-10c per horse power per hour; on crude petroleum, asphaltum base, ⅛c per horse power per hour; on domestic coal oil, 1⅛c per horse power per hour; and on gasoline, 2½c per horse power per hour.

General Mining Machinery and Supplies.

# Market Reports.

## The Markets.

SAN FRANCISCO, April 2, 1896.

The general situation has been further improved by a general rainfall in this State, with the heaviest precipitation in the southern part of the State, where it was needed the most. General trade continues good with the mining districts, but only fair in the agricultural sections on the coast. With continued favorable crop weather, it is only reasonable to assert that the call for goods and harvest machinery will show a steady enlargement and aggregate larger in volume than for two years past. The banks report for the month of March less business in their lines than has ruled in that month for several years past. This has been largely due to the very light movements of produce to the East, uncertainty regarding crop prospects and a lessened trading in speculative channels. At this writing they speak very hopefully of the future. They seem to be encouraged by a continued increase in the gold output, with a steady increase in the interest of gold mining, and the outlook favorable for a good outturn of wheat and better average prices than for two years past. From all we can learn they are relaxing somewhat from their antipathy to putting out funds except on gilt-edge security, and when this disposition becomes more pronounced a much better condition of affairs will set in. At the East the money stringency is relaxing owing to the action of the Government in affording relief to the banks in the Central States.

In this city there is a continued good inquiry for gold mines, and the better class of mining experts and said to be busy reporting on the many propositions on the market. As a rule the mines offered are not sufficiently developed to encourage buying. That the gold mining industry on this coast is steadily increasing can be seen by the following refined bullion returns of the Selby Smelting & Lead Co. which handles the most of the bullion sent to this city. In 1893 the returns aggregated $13,841,634.64, in 1894, $13,890,827.32 and last year $16,309,637. The gain in 1895 was nearly 20 per cent over 1894. It is expected that 1896 will show a good increase over that of 1895.

**New York Silver Prices.**

NEW YORK, April 2.—Following are the closing prices for the week:

| | Silver in London. | Silver in N. Y. | Copper. | Lead. |
|---|---|---|---|---|
| Friday | 31⅛ | 68 | 10 75 | 3 12½ |
| Saturday | 31⅛ | 68⅛ | 10 75 | 3 12½ |
| Monday | 31¼ | 68⅜ | 10 75 | 3 12½ |
| Tuesday | 31¼ | 68⅜ | 10 62½ | 3 10 |
| Wednesday | 31⅛ | 68⅛ | 10 62½ | 3 10 |
| Thursday | 31⅛ | 68 | 10 62½ | 3 10 |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.88 |
| London Merchants | $4.86 |
| London Sight Bankers | $4.89 |
| Refined Silver, per oz., 1000 fine | 68½c |
| Mexican Dollars | 55@56c |

SILVER.—Fluctuations the past week have been small, closing to-day lower at New York. In our market the demand is light and confined almost entirely to China and Japan. These two countries' requirements seem to be light for the time being. India has been the principal buyer so far this year, but her wants are chiefly met at the East and in London. The movements in silver bullion at this port for the past three years can be largely gauged by the returns of refined silver bullion by the Selby Smelting and Lead Co. of this city. They compare in ounces as follows: 1893, 6,377,311.25; 1894, 7,990,602.85; 1895, 9,488,460. So far this year the outturn by that company has been light, owing to a light demand for the bullion in this city. When this takes place, the bullion shipments go eastward and not to this city.

MEXICAN DOLLARS.—The market is unchanged. The demand is light at from 55 to 56 cents. The latter price is only obtained for small quantities by brokers.

COPPER.—In our market prices are not quoted lower, but it is understood that a slight shading can be secured by the larger buyers. Our Eastern advices state that the market under bear selling and increased receipts, in the absence of liberal consumption buying, has been receding. It is expected that an improved demand will set in soon, as the large quantities taken by Europe go into consumption. The consumption abroad and also in this country is not only very heavy, but seems to be increasing, particularly in Europe.

The market is quoted as follows:

| | |
|---|---|
| Bolt | ¼ & 5-16, 20c; ⅜ and larger, 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

LEAD.—The market is easier but no lower. At the East prices have declined under fair offerings and a lighter demand. The inclement weather there is against corroders; with better weather they will take more pig lead.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—The demand is fair for all sizes. The market is quoted as follows:

| | | | |
|---|---|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | | | $1 40 |
| Drop, B and larger sizes, | " | " | 1 65 |
| Buck, Balls and Chilled, do, | " | " | 1 65 |

QUICKSILVER.—The market is lower. There is a fair demand. The exports from this city for the first three months of the year compare as follows: 1894, 8,186 flasks; 1895, 5,222, and 1896, 12,701.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| West Coast of Mexico, for Export | 34 00 |

BORAX.—The market is firm at quotations. The shipments for the first three months of the year compare as follows, in pounds: 1894, 2,824,455; 1895, 1,462,861; 1896, 3,597,093. In the latter the railroad shipment for March is not included; it will aggregate over one million pounds.

The market is quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6½ |
| Refined, in sacks | 5⅝ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

TIN.—The market is unchanged. The demand for all kinds is reported slow. At the East the tone is reported steady to firm for pig.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—Our market is reported steady at 9c. The New York market is quoted as follows: Cookson's, 7⅞@8c; Hallett's, 6⅞c; Japanese, 6¾c.

COAL.—The market is reported easy for most kinds. If coal miners at Newcastle, N. S. W., strike it will delay shipments from that port and have an influence on our market. The output of the coast collieries is said to be about the same it was in 1895. The registered tonnage on the way from and loading at Australian ports aggregates 16,434 tons.

SPOT FROM YARD—PER TON.

| | | | |
|---|---|---|---|
| Wellington | $7 50 | @ | 8 00 |
| Greta | 6 00 | @ | 6 50 |
| Nanaimo | 6 50 | @ | 7 00 |
| Gilman | 5 50 | @ | 6 00 |
| Seattle | 5 00 | @ | 5 50 |
| Coos Bay | — | @ | 4 50 |
| Cannel | — | @ | 8 00 |
| Egg, hard | — | @ | 13 00 |
| Wallsend | — | @ | 6 50 |
| Scotch Splint | — | @ | 7 50 |
| Brymbo | — | @ | 7 50 |

TO ARRIVE—CARGO LOTS.

| | | | |
|---|---|---|---|
| Australian | 5 25 | | |
| Liverpool Steam | 5 25 | | |
| Scotch Splint | — | | |
| Cardiff | 6 25 | | |
| Lehigh Lump | 9 00 | | |
| Cumberland | 13 50 | | |
| Egg, hard | 10 00 | | |
| West Hartley | 6 50 | | |

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — | | — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — | @ | 8 50 |
| " in sacks | — | @ | 9 50 |
| Cumberland | — | @ | — |

LUMBER.—Redwood millmen have formed an organization and talk of advancing prices.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 16 00 | @ | — — |
| Pine | 13 00 | @ | 18 00 |
| Spruce | 25 00 | @ | 30 00 |

NAILS.—The expected advance of 25 cents will, it is now said, take place on May 1st.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Wire, carloads, basis per keg | | | $3 07½ |
| " jobbing, " " | | | 3 20 |
| Cut, carloads, " " | | | 2 82½ |
| " jobbing, " " | | | 2 95 |

IRON.—Eastern advices point to firmer prices. Japan has taken 26,000 tons of rails, while England is an active buyer of scrap and other old material from sections which have heretofore sent to Philadelphia. The Philadelphia *Ledger* reports as follows: Export business has been active of late. Locomotives have gone to Russia, rails to Japan, rolley cars to South Africa, and bridge work to Central and South America. The increased activity in British and continental iron markets will have a tendency to bring additional business to this country.

## Mining Share Market.

SAN FRANCISCO, April 2, 1896.

The past week has been devoid of special interest so far as outside operators are concerned, but to the little pools that reports credit the movements in the market it has been of considerable interest. Prices for the leaders in the Gold Hill and the north end groups were sent to still lower figures. The downward trend continued to Monday, when a slightly better feeling set in in the shares of both Sierra Nevada and Union. This improvement imparted a steadier tone to the entire list. Since then there have been small fluctuations, with the shares in two of the middle group mines showing more activity. The highest advance in Sierra Nevada, Union, Chollar, Potosi and Crown Point has been about 12 per cent from the lowest figures touched on the down grade. Even Con. Virginia, Ophir and Hale & Norcross seemed to be stronger, but they only sold at 3 per cent advance on the lowest bids. The market acts very much as if it will do better, but how much it is quite impossible to say, for those reported to be manipulating it have not a sufficient moneyed backing to make much of a pronounced up move in the absence of dividend paying propositions. While the Comstock leaders were reaching their low figures Bulwer, in the Bodie district, began to move up. It advanced from the low figure about 33⅓ per cent. In this move Bodie sympathized, but the other stocks in that district were inactive. Occidental had a slight decline. It sold down to 76 cents under bear reports, but recovered about 15 per cent on reports of the drill having run into ore. At the close the market for Occidental and shares in the Comstock mines, while having an unsettled, feverish appearance, looks as if the small pools are operating to send prices up so as to unload the holdings taken in on the down turn. In this move they will be assisted by the situation at the mines, for the work going on in several is liable any day to be of a more promising character, although it is not likely to continue long. This opinion is based on the work under way, and also that more assessments must be levied soon, and that several assessmeets fall delinquent within the next ten or twelve days. It takes money to pay assessments, and it is not at all likely that managers will levy them if convinced there is a large body of ore near at hand.

The affairs of the Hale & Norcross Company are still in an unsettled condition, but more or less work is said to be doing so as to straighten them out. Nothing, at this writing, is allowed to leak out by which a correct opinion can be formed as to what will be the outcome.

From the Comstock mines our advices indicate that in Alta they are still fooling around the Keystone lode, with the future not clearly defined. The work in the other mines in this group, if any is being done, is not made public. In the Gold Hill group the work is essentially unchanged. Seg. Belcher, Overman and Belcher are raising some ore, but it does not cut much of a figure in the market, notwithstanding there is an increase in the number of tons of ore raised by Belcher. This is probably due to assays of the latter being lower. From Yellow Jacket no news is at hand. The joint west drift of Challenge, Confidence and Con. Imperial is still going forward at a snail pace, although it was extended eight feet the past week, which is two feet faster than reported three weeks ago. In Alpha the work points to more time, as it does in Bullion.

In the middle group Hale & Norcross is still shut down, but in Potosi, Chollar and Savage the work reported is on two or more levels. It is practically unchanged since our last review. Some ore continues to be raised, but not enough to cover running expenses. In prosecuting the work under way they are liable to report an improvement at any time, but as far as can be learned it will not create more than a ripple in the shares of the mine in which it is reported. The long west drift in Gould & Curry continues to be pushed ahead, but it does not make much progress, owing to its distance and the character of the ground through which it is being run. From Best & Belcher nothing new comes to hand. The work in Con. Virginia continues on several levels. From the nature of the work going on, it ought not to cause surprise if an improvement should take place before long. This opinion is based on the direction in which the work on one of the levels is being done and also that this mine has been prolific in surprises. While saying this, it must not be inferred that a large body of ore is expected to be uncovered, only a sufficient quantity to give more life to the shares. In Andes the work under way is on two levels, but as yet it is unimportant. From Ophir, Mexican, Union, Sierra Nevada and Utah our advices regarding the work are about the same as heretofore reported. As has been the case for months, if not several years, past some of the more enthusiastic stock operators speak quite encouragingly of it. They are still hopeful of good results. It is to be hoped that they will not be disappointed and that the companies will find something more than assessments. Considering the work under way, it would seem as if some stringer at least ought to be found before long.

From the Brunswick lode our advices report continued active work in Occidental. It would seem as if the management has tired of running for the downward continuation of the ore found on the 550-foot level and has started to drilling for it. While this is an expeditious method of finding out what is ahead, still is more or less deceptive and not entirely reliable. Work on the Edwards shaft is still continued. The work being done by the other companies on the lode does not indicate any change from that heretofore reported in these columns.

From the Bodie district our advices are not of a very encouraging character. The ore found is either of too low grade when wide or else is too narrow when rich to attract attention or to raise the hopes of stockholders.

Assessments levied the past week were: Caledonia and Challenge Con., 5 cents each; Occidental 10 cents, and Crown Point 20 cents.

The following illustrates the changes of the week:

| MINES. | Mar. 26. | Apr. 2. |
|---|---|---|
| Alpha | $ 10 | ..... |
| Alta Consolidated | 17 | ..... |
| Andes | 33 | $ 32 |
| Belcher | 28 | 23 |
| Best & Belcher | ..... | 62 |
| Bodie | 28 | ..... |
| Bullion | ..... | ..... |
| Challenge | ..... | ..... |
| Chollar | 48 | 45 |

THE CALIFORNIA DEBRIS COMMISSION—having received applications to mine by the hydraulic process from A. J. McDonald, in the Kanaka Valley Mine, at Salmon Falls. El Dorado Co., to impound tailings in a ravine; from Paris Bean, in the Empire Hill Mine, in North-East Township, Yuba Co., to impound tailings in Empire Creek and in an old pit; from John J. Bailey, in the Badger Hill Mine, near Placerville, El Dorado Co., to impound tailings in a ravine; from B. Guidici, in the Grasshopper Hydraulic Mine, near Pleasant Valley, El Dorado Co., to impound tailings in a ravine; from Mrs. Amalie Hafner, in the Dark Ravine Mine, near Crescent Mills, Plumas Co., to impound tailings in Dark Ravine; from E. D. Hurd in the Miners' Row Mine, near Michigan Bluff, Placer Co., to impound tailings in a ravine; from Alfred A. Ludwig and William Everest, in the Nellie Bly Mine, near Igo, Shasta Co., to impound tailings in a ravine; and from R. E. Gumbert, in the Duquesne Placer Mine, at the head of Poplar Creek, Plumas Co., to impound tailings in a ravine—gives notice that a meeting will be held at Room 59, Flood Building, San Francisco, Cal., on April 6, 1896, at 1:30 P. M.

## TRUSTEE'S SALE
### IN SIERRA COUNTY.

On TUESDAY, APRIL 21st, 1896, at one o'clock P. M., at the front door of the Court House in Downieville, Sierra county, California, I will sell at public auction, to the highest bidder, for cash, all of that certain mining property, mills, machinery, boarding houses, tools, water rights, dams, etc., of the well known Young America mine, which consists of four contiguous patented claims and other locations; and also about 150,000 tons of tailings stored near the mine, and rich in free gold.

This sale is made by me as Trustee, and to make the sum of about $12,000.

Full information concerning the property and a full description thereof will be furnished on application by letter, or otherwise, to me at 230 California street, San Francisco, or to my Attorney in said matter, Frank R. Wehe, whose address is Downieville, Cal.

JOHN BERMINGHAM, Trustee.

## ANNUAL MEETING.

The regular annual meeting of the stockholders of the Jamison Mining Company will be held at the office of the company, Rooms 50 and 54, No. 120 Sutter street, San Francisco, California, on MONDAY, the 4th day of May, 1896, at the hour of 2 P. M., for the purpose of electing a Board of Directors to serve for the ensuing year and the transaction of such other business as may come before the meeting. SAM W. CHEYNEY, Secretary.

Office—Rooms 50 and 54, 120 Sutter street, San Francisco, California.

**An Assayer, Surveyor, Bookkeeper and Lawyer**

Wishes correspondence in relation to engagement. Address Box G, MINING AND SCIENTIFIC PRESS office.

# Assessment Notices.

CON. CALIFORNIA AND VIRGINIA MINING COMPANY.—Location of principal place of business San Francisco, California; location of works Storey county Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of March, 1896, an assessment (No. 6), of 30 cents per share, was levied upon the capital stock of the corporation payable immediately in United States gold coin to the Secretary, at the office of the company, Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of April, 1896, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on TUESDAY, the 28th day of April, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room No. 47 Nevada Block, No. 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin county, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 6th day of March, 1896, an assessment (No. 5) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 36, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 4th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 36, No. 309 Montgomery street, San Francisco, California.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees held on the twenty-fifth day of March, 1896, an assessment (No. 78) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth (28th) day of April, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

CHALLENGE CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 27th day of March, 1896, an assessment (No. 21) of Five Cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

C. L. McCOY, Secretary.

Office—Room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of April, 1896, an assessment (No. 22) of ten cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 28th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

## GOLD MINING PROPERTIES.

Having thoroughly canvassed this section of country during the past seven months, I am enabled to furnish valuable information to capitalists desirous of booding or purchasing meritorious mining properties in El Dorado county. Prospects, partially or wholly developed properties, or purchasable interests ready for operation but lacking capital, can be had on favorable terms. Address, A. E. HAMILTON, P. O. Box 66, Placerville, Cal.

## DELINQUENT SALE NOTICE.

GOLD BAR CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, near La Porte, Plumas county, California.

Notice. There are delinquent upon the following described stock on account of assessment (No. 5) levied on the Tenth (10th) day of February, 1896, the several amounts set opposite the names of the respective shareholders as follows:

| Names. | No. Cert. | No. Shares. | Amt. |

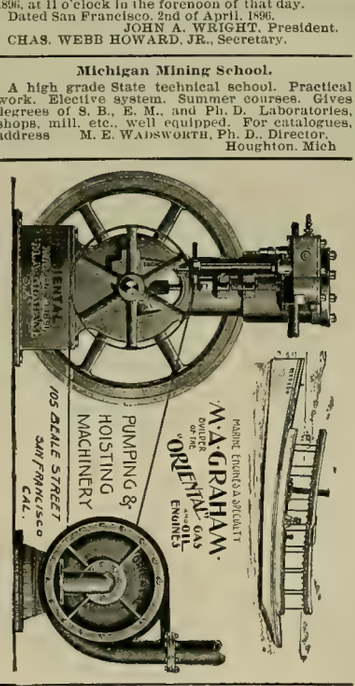
And in accordance with law, and an order from the Board of Directors, made on the 10th day of February, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Nos. 37 and 38 Crocker Building, San Francisco, California, on FRIDAY, the 10th day of April, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, 37 and 38 Crocker Building, San Francisco, California.

TO THE STOCKHOLDERS OF THE SOUTH PALOMA GOLD MINING COMPANY, LIMITED:



Notice is hereby given that by resolution of the Board of Directors of the corporation, adopted on the 21st day of March, 1896, a meeting of the stockholders of the corporation was called for the purpose of increasing the capital stock to the amount of two hundred thousand dollars, to be divided into one hundred thousand shares of the par value of two dollars per share, and of determining the disposition to be made of the increased capital stock; and it was resolved that such meeting shall take place at the principal place of business of the corporation, being the same building where the Board of Directors usually meet, to wit: No. 212 Sansome street, room 17, in the City and County of San Francisco, on WEDNESDAY, the 10th day of June, A. D., 1896, at 11 o'clock in the forenoon of that day.

Dated San Francisco, 2nd of April, 1896.

JOHN A. WRIGHT, President.
CHAS. WEBB HOWARD, JR., Secretary.

**Michigan Mining School.**

A high grade State technical school. Practical work. Elective system. Summer courses. Gives degrees of S. B., E. M., and Ph. D. Laboratories, shops, mill, etc., well equipped. For catalogues, address M. E. WADSWORTH, Ph. D., Director, Houghton, Mich.

# DEWEY & CO., 220 Market St., SAN FRANCISCO,

# PATENT SOLICITORS.

ESTABLISHED 1863

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class agency. We have able and trustworthy associates and agents in Washington and the capital cities of the principal nations of the world. In connection with our scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of patents already granted, for the purpose of determining the patentability of inventions brought before us enables us to give advice which will save inventors the expense of applying for patents upon inventions which are not new. Circulars and advice sent free on receipt of postage. Address **DEWEY & CO., Patent Agents, 220 Market St., S.F.**

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**

**220 Market Street..... San Francisco, Cal.**

*Assaying.—Part I—Gold and Silver Ores.*
Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price, postpaid.....$1 00

*Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

*Assayer's Guide.*
By Oscar M. Lieber.....$1 50

*Assayer's Manual.*
By Bruno Kerl. Translated from the German by Wm. T. Brannt. Second American edition, edited and enlarged by F. Lynwood Garrison. Illustrated.....$3 00

*Manual of Assaying—Gold, Silver, Copper and Lead Ores.*
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

*Notes on Assaying and Assay Schemes.*
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

*Prospector's Field Book and Guide.*
By H. S. Orborn.....$1 50

*A Practical Guide for Prospectors and Miners.*
By C. W. Moore. With numerous illustrations.....$4 75

*The Explorer's and Assayers' Companion.*
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

*Aaron's Leaching Gold and Silver Ores.*
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

*Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

*The Lixiviation of Silver Ores with Hyposulphite Solutions.*
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

*Modern Copper Smelting.*
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

*The Metallurgy of Gold.*
By M. Eissler. Profusely illustrated.....$5 00

*Losses in Gold Amalgamation.*
By W. McDermott and P. W. Duffield.....$2 00

*Electricity in Mining.*
By Sylvanus P. Thompson.....80 cts.

*Practical Treatise on Hydraulic Mining.*
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

*Practical Hydraulics.*
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

*Hydraulic Gold Miner's Manual.*
By T. S. G. Kirkpatrick. With plates and cuts.....$2 25

*Manual of Hydraulic Mining for the Use of the Practical Miner.*
By T. E. Van Wagenan.....$1 00

*The Sampling and Measurement of Ore Bodies in Mine Examinations.*
Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

*Manual of Mining.*
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

*A Text Book of Mineralogy.*
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

*Manual of Determinative Mineralogy.*
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

*Metallurgy of Silver, Gold and Mercury in the United States.*
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and fo ding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 50

*Metallurgy of Silver, Gold and Mercury—Continued.*
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

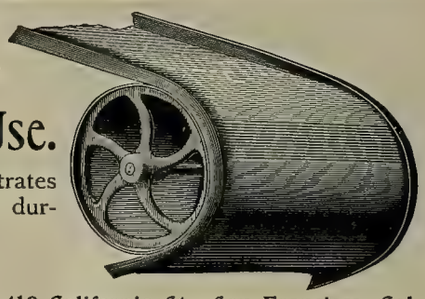
*Notes on the Treatment of Gold Ores.*
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

*A Practical Manual of Minerals, Mines and Mining.*
By H. S. Osborn.....$4 50

*Matte Smelting—Its Principles and Later Developments with an Account of the Pyritic Processes.*
By Herbert Lang.....$2 00

*Cyanide Processes for Gold and Silver Ores.*
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

*Practical Metallurgy and Assaying.*
By A. H. Hiorns.....$1 50



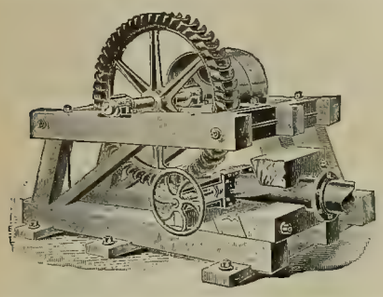
*The Practical Metal Worker's Assistant.*
By Oliver Byrne. Illustrated.....$5 00

*Quartz Operator's Handbook.*
By P. M. Randall.....$2 00

# Improved Ore Concentrator Belts. PATENTED.

(RIFFLED OR SMOOTH.)

## Suitable for all Ore Concentrating Machines in General Use.



These belts, with slight riffles at intervals, *will save* a greater percentage of valuable concentrates *than any other vanner belt.* Our new style flanges on the edge of the belt make it much more durable than any other. Send for circular and price list.

THE BLASDEL IMPROVED ORE CONCENTRATOR BELT CO.,

H. G. BLASDEL, Jr., Manager. Cable Address: BLASDEL. Haywards Building, 419 California St., San Francisco, Cal.

# RISDON IRON WORKS.

OFFICE AND WORKS, COR. BEALE AND HOWARD STS., SAN FRANCISCO. CABLE ADDRESS, "RISDON'S," SAN FRANCISCO.

The above cut shows the general arrangement of one of Knight's Standard Water Wheels, of which there are more than 450 in use in California alone. These wheels are made from 2 feet to 6 feet in diameter, from 10 to 1000 horse power, and adapted to all heads and purposes.
Descriptive circulars mailed free on application.

VOLUME LXXII. Number 15. SAN FRANCISCO, SATURDAY, APRIL 11, 1896. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

### The Cripple Creek, Colorado, District.

Herewith is illustrated Battle mountain, in the Cripple Creek, Colorado, district, Victor and two of the leading mines, the Independence and Portland. From the early days of the district it has been the site of active profitable mining operations. Victor is on the south slope of Battle mountain, near Wilson creek. Battle mountain is geologically described as an area of volcanic rocks surrounded on the east, west and south by granite and on the north by other volcanic materials. The mountain is mostly breccia, intersected by several dikes that cut the breccia and granite. On its south slope the granite dips beneath the breccia, the probability being that some of the mines started in breccia there may pass into granite as depth is attained, still carrying the ore. The veins occur in fissures and fissured zones, in some cases being well-defined bodies of quartz, in others being impregnations and partial replacements of the country rock with mineral matter along the fissures, the prominent veins being in the breccia and adjoining granite. The Independence mine is on the south slope of Battle mountain, just above the town of Victor. The ore of that mine consists of granite from which the quartz and mica have been almost wholly removed, leaving a vesicular mass of partially kaolinized feldspar, this being probably due to fluorine compounds evolved from the phonolitic magma. In this the cavities have been subsequently filled by secondary quartz, iron pyrites, fluorite, telluride of gold, etc. In such porous material surface water has freely percolated, the pyrites being largely oxidized down to the lower levels and the telluride partially converted to free gold. Where the vein crosses the dike the gold still exists in the telluride form even near the surface, as there the water did not have such free access as in the more open granite.

The Portland mine almost immediately adjoins the Independence farther up the slope of Battle mountain. Its main openings are in breccia intersected by parallel fissures, closely assembled in which the veins occur. A dike passes longitudinally along this fissured area, being itself fissured similarly. Two of the main veins are in the breccia and one in the dike between them. The vein to the east of the dike is called the footwall vein; that to the west the hanging-wall vein. The "sylvanite vein" is a seam in the breccia rich in telluride ore.

Calaverite, found so sparingly in this State, is rare in Cripple Creek also, and has been heretofore mistaken for sylvanite, its distinguishing feature there being that, though the lowest silver carrier of the gold-silver tellurides, carrying usually three per cent of silver, that found in Cripple Creek gives but nine-tenths of one per cent.

San Francisco, April 11, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Victor, from Battle Mountain; View of Battle Mountain, Cripple Creek District, Taken on Conejos Property, March 3, 1896; Independence Mine, Cripple Creek, Colorado; Portland Property, Cripple Creek, Colorado, 281. Glimpse of Scenery as the Cripple Creek Region Is Approached, 284. Street Scene in Cripple Creek in 1891; Town of Cripple Creek in 1894; Street Scene in Cripple Creek, 285. Harrison Conveyor Coal Screen; Jeffrey Roller Chain Conveyor, 292.

EDITORIAL.—The Cripple Creek, Colorado, District, 281. A Contemptible Figure by the Anti-Debris People; Inexperienced and Misinformed Correspondents to Daily Papers; Articles of This Paper Widely Copied; Appropriation Passes the House of Representatives; The Smelter Project, 282.

SCIENTIFIC PROGRESS.—Origin of the Roentgen Rays; Roentgen's View That the X Rays Differ from Cathode Rays Not Accepted by All Physicists; A Surveying Party to Alaska, 290.

MECHANICAL PROGRESS.—Harrison Conveyor Coal Screen; Jeffrey Roller Chain Conveyor; An Important Change in Engineering Practice, 292.

ELECTRICAL PROGRESS.—Obtain Their Electricity Without Paying for It; Cathodic Rays Literature; Electric Welding; Telegraphing Through Space; New Use of Trolley Roads; Telegraphy by Machine; Passed into the Hands of a Syndicate; A Machine to Experiment in Distributing Electric Waves; Thought an Excessive Rate for Electric Lights; Telephonic Competition; Let a Contract for Wooden Piping; Will Turn on Its Currents; Park City Electric Co. Has Incorporated; Proposes to Install an Electrical Power Plant; A Daring Conception, 294.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 300-1.

PRACTICAL INFORMATION.—A Manual Is Needed for the Neophyte in Mining; Making Tight Petroleum Joints; A Distinguished Traveler, 308.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 310.

MISCELLANEOUS.—Concentrates, 283. The Cripple Creek Gold Field, 284-5; Beat the World's Record, 285. "Invention"—The Indefinable Requirement of the Patent Law, 286. Matte. Smelting, 288. Steal Inventions of Others, 290. Coast Industrial Notes; Personal, 304. Commercial Paragraphs, 306.

A CONTEMPTIBLE FIGURE was presented last week by the anti-debris people in the presence of their representative, R. T. Devlin, in Washington, D. C., in the avowed character of an obstructionist. Neither he nor those he represents had any plan to propose to overcome existing evils; he simply was against doing anything, and appeared unsuccessfully before a united California Congressional delegation asking them to undo their work done in the interests of the very valley residents he claims to represent. Seldom has been exemplified how devoid of even self-respect a human being, otherwise intelligent and law-abiding, may become when his salary is affected and his "influence" ignored. But consciousness of his own identity is probably sufficient condemnation.

INEXPERIENCED and misinformed correspondents to daily papers sometimes send news from the Lake Superior copper country concerning the mines that is erroneous and misleading and the cause of loss in some instances to investors in mining stocks. A recent item sent from Houghton, Mich., states that the "Calumet & Hecla Mining Co. is pursuing the same policy as it did last winter, and by spring will have another immense reserve supply of unsmelted mineral. In case of any material advance in the price of copper, a large increase in the output of refined copper can be looked for from the Calumet, though the rate of the production at the mine will not be greatly increased." From reading that no other inference can be drawn than that the Calumet & Hecla is manipulating its product to meet the market, and that it has an "immense reserve" of copper to shove upon the market in case of a spurt in price. This is not the case. The Calumet & Hecla has a smelting plant at Buffalo, as well as at Lake Linden, where its stamp mills are located. As the transportation of the product of the stamp mills, "mineral copper," by rail is out of the question, compared with the much lower freight tariff by water, the Calumet & Hecla accumulates every year during the season when navigation is closed sufficient mineral copper to supply the Buffalo smelting works with a sufficient quantity to operate its furnaces. The refined product of its Lake Superior smelting works also accumulates until the opening of navigation, but in case of immediate large orders or an advance in price the refined ingots, bars or plates are then shipped by rail, but never the "mineral copper." The mine work is always regular and the rock is usually crushed as fast as mined.

AT the risk of appearing self-laudatory, this journal takes pleasure in having its articles so widely copied. Many of its original articles appear subsequently in some of the leading mining and scientific publications of the world, being of manifest value. The second and concluding section of the masterly article on "Invention—the indefinable requirement of the patent law," in this issue will be recognized by thinking minds on both continents as a clever analysis of an important subject, and will doubtless meet with wide reproduction. Mr. W. H. Smyth, the author, is a San Franciscan, and deservedly prominent in the practical exercise of the faculties concerning which he writes with unusual force. In his article, the first installment of which appeared in last week's issue, he closely and cogently argues out a point that seems to have hitherto escaped the observation of many who have given the subject considerable attention. The second article on "Matte Smelting" from an eminent, practical authority, is of wide interest and current value. Probably no subject is of more present interest to smelters and metallurgists in general than the one now under discussion in these columns by Mr. Austin. It is such articles that elicit further discussion, and aid in permanently establishing the truth or falsity of that stated. The comparison of coke-burning furnaces and sulphide burners with incidental reference to Mr. Lang's recent work, will attract universal attention. "The Gold Field of Cripple Creek," by T. A. Rickard, State Geologist of Colorado, is believed to be the first appearance in a journal of this class of a correct portrayal of that locality from a competent resident. Every week important articles from different specialists appear herein, being one of the strong features of this journal, and the favor with which they are received, and their reproduction sufficiently illustrate their value. Anything relating to mining, both as to methods and places that appears herein, is widely read by intelligent men. Judging by the usual calculations made by advertising agents and vendors of periodical literature, this issue will be read by more than one hundred thousand men, of a class that is quick to detect shams and resent any statement that appears to be an insult to human intelligence.

ON Monday, the 6th, the appropriation of $250,000 passed the House of Representatives by a practically unanimous vote. The Saturday previous, the Governor of this State said that the appropriation made by the State contingent upon the national appropriation had been paid into the general appropriation fund, which fund was exhausted, the appropriation used for other purposes, and that he didn't see how a warrant could be drawn against it. Of course, this from the chief executive officer of the commonwealth was aid and comfort to the opponents of the measure, and his remarks were wired to Washington on Sunday. But that eleventh hour attack was neutralized by the activity of Secretary Sonntag, of the California State Miners' Association, who got an official opinion from the Attorney-General of the State that the act of the Legislature admitted of but one construction, viz: "that whenever Congress makes an appropriation of $250,000 for the purpose specified in section 4 thereof, this appropriation of $250,000 therein made will be immediately available for those purposes." In addition, official statements were secured from State Controller Colgan, and Deputy State Controller Douglas that the money was in the State treasury and would be forthcoming. All this was wired to T. L. Ford, who made immediate use of the information and the next morning Congress passed the bill. No one's motives should be misconstrued. Maybe Gov. Budd believed what he said. After the bill passed, he expressed his satisfaction and suggested the improbable necessity of amending it in the Senate. Attempted amendments are usually fatal to a Congressional measure of this nature. It is unfortunate that the Governor should happen to make those suggestions at the very time they would, if met, be most likely to defeat the measure. It is believed that the Senate will this week pass the bill as received from the House. No doubt this will please the Governor who, at the '94 convention of miners in this city, said in an address: "You have my utmost sympathy, and any proper measure in the line of your deliberations that may come before me as Governor will not only have my approval BUT WHEN IT IS IN THE HOUSE AND SENATE IT WILL HAVE MY ENERGETIC AND HEARTY SUPPORT. This is not mere talk. A man should be in an insane asylum who will not recognize that engineering skill, properly backed by the Federal Government, will show that mining is properly carried on as in the past, without injury to the industries of the valley." The miners believed Gov. Budd's sincerity then and we hope that no future action on his part will shake such belief.

SAN DIEGO, CAL., is earnestly agitating a smelter project. A smelter in operation is a good thing for a community; it brings considerable business and locally expends the most of its earnings. There is nothing magical, however, about its presence. Building a 100-stamp mill does not insure the immediate existence of sufficient ore to keep it profitably going. Of course, where one sees a stamp mill, it is fair to assume that much ore must be contiguous; but there are cases where sanguine men built the mill first and then started to develop the ledge. So with smelters, though occasionally some smart middleman succeeds in spending some one else's money in building a smelter; yet, ordinarily, the rules of business prevail and the question: "Will it pay?" is thoroughly gone over before the plant is ordered. There is now a partially completed smelter in Los Angeles, which is much more of a mining and commercial center than San Diego, and distant only a little ways, as distances go in California. So far as known, the Los Angeles smelter is not yet a commercial success, though the reasons why it should be a success are much greater in Los Angeles than in San Diego. There is another smelter at Portland, Oregon, which is not a source of present profit to its owners. The Spokane, Wash., smelter was much talked of, but has never been fired and is now somewhat obsoloscent in pattern. At Stege, Contra Costa Co., is a similar example. These are referred to merely as practical object lessons of a fact sometimes forgotten or ignored by newspaper commendation of proposed smelters, that the same commercial laws govern this matter that decree success or failure in any department of the business world. A smelter must be centrally located, with reference to competing lines of rail and water transportation, where ores can be drawn from all directions, where cheap fuel, fluxes, etc., can be readily secured and the resultant product as readily placed. There is as little co-operation and as much competition among smelters as among any and all other forms of business. The projectors of a smelter who leave out of their calculations the questions of supply and demand and the cost of the smallest item cannot expect satisfactory returns. Then, too, a smelter to be profitable in the highest degree must be on a large scale, for there must be low rates and ore can be handled most economically in large quantities. That involves considerable necessary outlay. Nor is this all. A smelter to be largely successful can not be a hand-to-mouth concern. It needs strong financial backing; surplus funds to buy ores in the market, if need be, and not depend solely on "custom work." Finally, it is needful to insure due measure of success that competent metallurgists be in charge. The discussion now going on in these columns on "matte smelting" is of present point on this as on other matters of considerable metallurgical importance. After all, "the man behind the gun" is the most important factor. Given plenty money, commanding site, favorable transportation rates, low figures for necessary requirements, abundant supply of ore, a comprehensive, up-to-date plant, and without a competent man in charge, the furnace can not be a success. Those men are not plenty, and it is only a concern financially capable that can secure their services. There is nothing added herein to the stock of general knowledge on this subject, but noting the present urgent and oft-repeated calls for a smelter in so many localities in this west half of America, it is deemed not amiss to remind some of our readers of a few homely facts that, in the possible event of investment, it would not be profitable to forget.

## Concentrates.

THE Eureka, Nev., *Sentinel* has ensmalled.

LOS ANGELES has organized a mining exchange at 208 S. Broadway.

A $10 ASSESSMENT on Butte & Boston is looked for by some Montana stockholders.

THE March payroll on the Comstock aggregated $60,000, the smallest for some time

SIXTY addit onal stamps are being put along with the sixty in the Mexican Alaska mill.

THREE CYANIDE PLANTS are now in operation at Wickenburg, Arizona, and the old Vulture mine is being reopened.

Now is a good time to begin doing assessment work. It's got to be done sometime during '96, and the sooner the quicker.

LAST week in this column it was stated "Next Saturday's issue of this paper will contain twenty-four pages." It does, and eight more.

PEARCE, ARIZONA, is now a postoffice, and is reported coming to the front since its principal mining property was bonded for $275,000.

A ROCK SALT drying plant, "the first of its kind on earth," is in successful operation at the works of the Inland Salt Co., Salt Lake City, Utah.

IT is questionable whether the new Yahk mining district is in Idaho or Montana, and miners there are recording their claims in both States.

W. H. THOMAS, a prominent Arizona miner, was choked to death on the street in Phoenix last Tuesday by an orange seed lodging in his throat.

THE Chollar and Potosi mining companies decide to continue work in the Brunswick lode, despite the withdrawal of the Hale & Norcross from the combination.

THE *Miner* says it is no use going to Bodie looking for a job. All the men needed were engaged last fall, and there are more men there now than there is work for.

PUEBLO, COL., talks of building a railroad to Cripple Creek. The only wonder is that Pueblo hasn't long since built thirty-two miles of the proposed road to the mountains.

MONTANA'S mineral land commissioners have resumed work in the Bitter Root valley. From there they will proceed to complete the classification of lands in the Kalispell district.

CRIPPLE CREEK, COLORADO, is extending its list of dividend-paying mines and curtailing its list of "boom" companies which are the unavoidable accompaniment of all mining centers.

A UTAH company recently organized claims to be able to manufacture cyanide of sodium at a cost of six cents per pound, and cyanide of potassium at a cost of nine cents, which is not probable.

THE Dubois lead ore sampling bill puts a $15 duty on foreign lead and lead ore, one-half what it was under the McKinley bill. It's better than nothing, but could be increased with benefit to the domestic miner.

FURTHER news from the Rawhide mine, Tuolumne county, regarding the recent strike there on the 930-foot level confirms the reports of its richness. Its already large monthly yield will now be greatly augmented.

THE trouble at the Hale & Norcross, Virginia, Nev,, has been obviated by the appointment of another superintendent, Jas. Cronin, an old Nevada miner, and a new man on the Comstock. Operations were resumed last Wednesday.

LAST Tuesday the Lucilla gold mine, Plymouth, Amador county, was sold to satisfy a judgment, J. E. Lees and J. H. L. Milne, of Liverpool, England, represented by Alfred Sutro, of San Francisco, bidding the property in for $45,323.

A RUSH of prospectors is reported from Lovelock, Nev., to the Rabbit Hole mines. Placer gold is known to exist at Rabbit Hole and vicinity, but water is very scarce. The mines are along the old Honey Lake and Humboldt road.

OZONE is now announced as a gold solvent and the claim made that refractory ore can be successfully treated thereby. It may be just the thing needed at Meadow Lake. There is plenty of ozone securable there, and there is any amount of rebellious ore.

IN the last four months Nevada county has contributed nearly $900 to the California State Miners' Association. Nevada and Placer have been the financial backbone of the association outside of this city, which has given thousands to aid the cause of the miner.

AS A STANDOFF to Mercur, Utah's being "the Johannesburg of America, a Snake River, Idaho, man writes that that region is "the Transvaal of the Pacific Northwest." 'Tis now in order for a Johannesburg paper to refer to "the mother lode of the Witwatersrand."

AT a champion drill contest at Butte, Montana, last Saturday, T. Tallon drilled 37¼ inches through a granite block in fifteen minutes. More than $3000 changed hands on the result. Tallon pounded the steel sixty blows a minute for the whole time and never missed a lick.

SAYS the Virginia, Nev., *Enterprise:* "The Utica mine, in Calaveras Co., Cal., turns out five times more gold than the Robinson, which is the most noted of the African mines. The Utica employs 700 white men at $2.50 to $3 per day, while the Robinson has 2500 Kaffirs at 30 cents per day each."

THE regular monthly statement that the Rothschilds are seeking to secure control of the Anaconda, Montana, mines, this time names $40,000,000 as the proffered price for a two-thirds interest. The value of the mines justifies those figures, though their frequent repetition grows tiresome.

AUTHENTIC statement comes from Nevada Co., that the famous old Allison Ranch mine is to be reopened, and is in the hands of men financially able and possessed of enough stick-to-itativeness to make it a go. The mine has produced over $3,000,000, and at one time gave employment to 250 men.

THIS week the New York and Boston owners of the Merced Gold Mining Co.'s stock are inspecting their property at Coulterville, Mariposa Co., on which, so far, they have expended about $700,000. They also own the Butte & Boston, Montana property, and have further interests in Arizona, whither they will go after looking over the California work which gives promise of being the most valuable of all their large investments.

THE Yreka *Journal* says: "Work on the big French Creek ledge has been suspended, owing to a dispute about the price of water. The company will put in an electrical plant to operate the mine, and will doubtless put in a mill of about twenty stamps, which will also be operated by electricity."

THE Grass Valley *Union* says that a letter from one of George Starr's friends in South Africa states that as consulting engineer for Barnato Bros., he now has charge of seventeen mines and is receiving a salary of $50,000 a year. A. W. Stoddart, who is superintending a mine there, gets $10,000 a year.

AS IT now stands in the provincial parliament, the British Columbia mine tax is one per cent on the assessed value of all ore or mineral-bearing substances from any lands in the Province, as ascertained and determined from verified smelter, reduction works or other returns satisfactory to the assessor.

A MINUTELY DETAILED REPORT of the Cariboo, B. C., properties in charge of J. B. Hobson, signed by him, gives the value of the gold gravel at 50 cents per cubic yard. In hydraulic mining ground paying ten cents a yard is ordinarily a paying proposition, and where it averages twenty-five cents is unusually good.

INVESTIGATION in the brass brick swindles in and around Oakland, Cal., developed the fact that eight or ten men there who wanted something for nothing have been cleverly victimized by two or three swindlers who are now parting with some of their newly acquired wealth in an effort to get free from legal entanglement.

THE following California gold mines have paid dividends as follows: Idaho, $5,489,000; Standard, $3,771,159; Kennedy, $2,734,000; Plumas Eureka, $2,696,295; Bodie Consolidated, $1,677,572; Sierra Buttes, $1,559,933. There are others. Unincorporated mines are the biggest yielders, one, the Utica, of Calaveras, being credited with a steady output of $500,000 per month.

AT the Bulwer Con. election last Wednesday both sides claim a victory. The New York stockholders held a majority of the stock, and when the old directors declared the meeting adjourned and withdrew, the others held a meeting of their own and elected directors and officers. The old management decline to recognize them and continues to hold control. Litigation will result.

THE Hope mine at Basin, Montana, has closed down, there not being room for two superintendents in one mine. Helena men held forty-five per cent of the stock and put in a miner; Michigan men owning the other fifty-five per cent put an Eastern man in charge, with the usual result. It is probable that one of the opposing forces will buy the other's interest. The mine is a valuable property.

A FORT WORTH, TEXAS, RESIDENT, who unnecessarily states that he is not a subscriber to this paper, writes asking where he can "buy a mineral rod that will locate silver and gold and hidden treasure." He prudently says he wants a genuine one, and will not pay unless it is in every way satisfactory. 'Tis such good-natured people as he that keep alive the much-advertised brass-brick industry now so prevalent and profitable around Oakland, Cal.

THE members of the Idaho Mineral Land Commission have resumed work, and expect this season to survey the most of the pan-handle of Idaho, extending from twenty miles south of the Northern Pacific road to the boundary line on the north. It would please the writer to be able to make some similar statement regarding the California Mineral Land Commissioners. The bill creating that commission is still before the Senate Committee.

THE Gold Mining Exchange of San Francisco was formally opened last Monday. Addresses were made by Walter Turnbull, president of the exchange, Irving M. Scott of the Union Iron Works, Hugh Craig, president of the Chamber of Commerce, John Daggett, superintendent of the U. S. Mint, and others. The exchange has for its officers: President, Walter Turnbull; vice-president, John Daggett; treasurer, D. E. Miles; secretary, J. F. Crosett.

A. N. BUTTS who sold the Golden Gate mine at Mercur for $75,000, which is now credited with $2,000,000 of ore in sight, is retrieving his mistake by operating five properties on the California mother lode, where he has excellent prospects. The Utah transfer shows how close a miner sometimes comes to bonanza and then some one else gets it. The first blast in the Golden Gate an hour after the $75,000 deal was made disclosed the oxidized ores that now give that property its great value.

G. G. GATES, of Jackson, Cal., has a patent system of separation and concentration of tailings that is in operation. One plant at the Zeila mine tailings treats 150 tons per day; a pump is used to raise the tailings 12 feet. The Carson Creek plant, near Angels, is not yet completed. It is expected that the Utica plant at Angels will daily treat 600 tons of tailings from the Utica, Stickles and Madison mines. It will be lighted by electricity and it is expected to commence operations May 1st.

A KENNETT, Cal., subscriber writes that he has a telluride deposit, and asks is tellurium paid for in smelters. It is not ordinarily practicable to save the tellurium contained in gold or silver ores when smelted. It is believed there is no smelter in this country that does. It is mainly produced by Alexander Maly's wet process at Schemnitz, Hungary, from gold telluride ore. It occurs in minute quantities in various places in this State and Colorado, but it is unlikely that the Shasta Co. "deposit" is of sufficient extent to justify the expense attendant upon its treatment.

A FRESNO correspondent asks where "aluminum is reduced or produced." The principal reduction works in this country are at Pittsburg: Niagara Falls contemplates reduction works and a St. Louis Company is now arranging to put in a plant at Greenland, Colorado. The total U. S. production is now about six tons daily: the wholesale market price in New York last Saturday was fifty-five cents per pound. The cost of production is said to be twenty-five cents per pound, the cost of raw material fifteen cents per pound. This applies to the Pittsburg concern which imports fluorine. Colorado claims to be able to furnish clay sufficiently rich to yield aluminum by the electrical process for twenty cents per pound including all expenses.

IF thousands of miles away across oceans and deserts there was a mining region inhabited by thousands of intelligent men and women, surrounded by all the comforts of civilization, with fruits and flowers nine months in the year, a railway at their door, a climate incomparable and millions in gold being taken from the ground, it would be heralded to the ends of the earth as the one great blissful El Dorado; yet there is more than one such locality in California of which all the above is strictly, literally true, and, being in California, it is taken as a matter of course.

WRITING of South African affairs, the London *Mining World* of March 28th says: "The Transvaal labor trouble is still acute. There is supposed to be an agreement among the different mines to keep the wages of natives down to something under £3 10s per month, but we are informed of many cases where £4 or £4 10s is being given in the competition for boys. It is the old story of supply and demand, and where the interests and reputation of a big company are at stake it is easy to understand a manager offering, almost in distraction, inducements to natives to leave other mines and come to his."

THE mints are now coining standard silver dollars at the rate of 1,500,000 per month from the silver bullion purchased under the Act of July 14th, 1890. Of the number of silver dollars now being coined, 1,031,375 will be held for the redemption of Treasury notes, being the cost of the bullion contained in 1,500,000 silver dollars at the average cost of silver bullion purchased under the Act of July 14th, 1890. The remainder, 468,675 dollars, will be paid into the Treasury as profits on the coinage of silver bullion, and against which silver certificates can be issued and used in the payment of any expenses of the Government.

ABOUT 90 taels buying as much on the average of Chinese commodities to-day, when silver is 8¼ cents an ounce, as 100 taels bought in 1873, when silver was $1.29 an ounce, it is evident that Chinese products can be sold in gold-using countries for less than one-half the price in gold than was possible when silver was worth $1.29 an ounce. Or, accurately, 90 ounces of silver buying as much to-day in China as 100 ounces in 1873, and these 90 ounces, costing in gold 8¼ cents an ounce, instead of $1.29 an ounce, $61.50 in gold will buy as much to-day as $129 in gold in 1873, or 106 per cent more—6 per cent more than twice as much. Consequently, the Chinese can sell their produce in our markets for less than one-half the price they could before silver was demonetized. And what is true of the Chinese is true of other silver-using peoples.

AT Michigan Bar, Sacramento Co., Manager Smyth of the Interior Development Company proposes to put in an electric plant, so that the men operating the monitor, drills, picks and shovels will be able to work at night. The company has increased its water supply several hundred inches by erecting new flumes and siphon-pipes along its entire line of forty-six miles of ditch. This, it is thought, will insure an abundant supply of water to the large irrigation districts on the Cosumnes river. Two monitors, one eleven inches and another seven inches in diameter, were turned loose on a 75-foot gravel bank at Forest Home, near Michigan Bar, last week. Three miles of pipe have been laid sufficient to secure a water supply. The engineers estimate that there is enough gravel in sight for a run of fifty years. The facilities for impounding the debris are unexcelled. The gravel, an ancient channel, is deposited at the head of Arkansaw creek. Below the mine the water will be diverted by means of a stone impounding dam into an irrigation ditch. Not a grain of sand or a drop of water will ever find its way into the river.

TIREY L. FORD, the Washington representative of the California Miners' Association, wires from the national capital his belief that the mineral land bill will go through both houses of Congress in its present shape. Last Thursday the Sacramento *Record-Union* served formal editorial notice that the Southern Pacific Company had withdrawn all opposition to the bill—would do all it could to pass it. This is the worst thing that has happened so far, but the miners will correctly interpret the announcement as making a virtue of necessity. It is probable Congress also will so understand it. The *Record-Union* article states several things that are not so, and in giving up the fight does it so cleverly that those unacquainted with the facts would be inclined to believe it. Meanwhile no friend of the bill, in or out of Congress, should relax the slightest effort till it has become a law. When that comes about it will be in order to see that the commissioners who will administer and interpret it are not biased. The President, who has the appointing of these commissioners, is fully advised and will not lack information as to the facts.

THE Act of the California Legislature of '93, making contingent appropriation of $250,000 is as follows: "There is hereby appropriated out of the General Fund of the Treasury of this State the sum of $250,000, no warrant against said sum to be drawn or paid until the United States Government shall have appropriated at least an equal amount, to be used in the construction of works for the restraining or impounding of mining debris in California, said moneys to be paid only upon an order drawn by the Controller upon the written request of said Debris Commission, and to be drawn only for the payment of not more than one-half of the cost of construction of any such works for restraining and impounding mining debris as shall have been approved by him and duly adopted and recommended by engineers of the United States Government appointed for that purpose. All expenditures are subject to the approval of the State Board of Examiners." The United States Government is now making the $250,000 National appropriation that unlocks the State appropriation made three years ago. Gov. Budd has tried to make a point that that contingent appropriation has been paid out, and that the Legislature would have to make it over again. The Governor's ability to veto such a bill need not enter into the case. His point is not well taken. The official text of the appropriation herein given in full refutes the objection of the Chief Executive of the commonwealth. "No warrant against said sum to be drawn or paid until the United States Government shall have appropriated at least an equal amount," etc. Of course, it is well understood here that the State appropriation is charged to the State fund and available whenever the fund is replenished, but probably not so well understood at Washington. It is possible that our good Governor's remark was not intended for home consumption.

## The Cripple Creek Gold Field.

By T. A. RICKARD, State Geologist of Colorado.

The stirring pages that tell the checkered story of western development record many queer-sounding names whose inappropriateness or lack of euphony has long since been obliterated by the impress of fame. Five years ago "Cripple Creek" sounded such an unlikely name for a great gold field, and yet to-day "Cripple Creek, Colorado," has by the magic baptism of its golden discovery become as alliterative and impressive as the most exacting company promoter could desire.

The locality of the new district is itself full of romantic suggestion. Overshadowed by the granite battlements of Pike's Peak, its very position recalls the fact that it has fulfilled the expectations of the pioneers of 1858. "Pike's Peak or bust," the mock-heroic motto of the immigrants of an older generation, tells of the delusion which led so many a hardy prospector to associate the occurrence of gold with the beacon mountain first reconnoitered by Capt. Zebulon Pike in the dawning years of the century. No gold was at that time found in the canyons or on the hillslopes encircling the peak. Colorado's early discoveries were all made farther north within the watershed of streams fed by the snows of Gray's Peak and Mt. Evans.

Not long ago the cowboy, tending the cattle that until recently found the grass-clad hill slopes a kindly pasturage, looked north, west and south from ridges now teeming with the busy life of Cripple Creek and could see in the distance the snowy ranges which watch over the old camps of Gilpin and Clear Creek, the white banner of the Mosquito range overlooking Leadville, the serrated ridge of the Sangre de Cristo near Silver Cliff and the great complex of the mountains of the San Juan; and as his eye took in a panoramic view which covered so much of the most productive portion of the State, he never dreamed that the day would come when the dull monotony of the cow pasture would be swept away by the eager rush of the gold digger and the feverish haste of a great gold field.

More than once in the years gone by the hidden wealth of Cripple Creek was on the verge of detection. There was some abortive silver mining on the claim since known as the Elkton as early as 1874. Many will remember the Mt. Pisgah fiasco in April, 1884, when a dark, conical hill, now overlooking the town, was the scene of a mining excitement long notorious for its untimely ending. A horde of deluded prospectors were drawn thither by the assays obtained from certain claims whose croppings had been subjected to a Keeley cure and inoculated with chloride of gold at the hands of designing schemers. The little low-grade quartz discovered at that date only served to add bitterness to the disappointment. The stampede ended in a fiasco.

In the early days of 1891 a few men wandered over the hills from Colorado Springs and in February the first recorded location was made. Rumors of a new gold camp began to circulate in Denver, but the contemporaneous discovery of Creede diverted attention and the recollection of Mt. Pisgah evoked a contemptuous unbelief. And, in truth, the small veins first found at Cripple Creek did not compare with such a magnificent lode as the Amethyst, whose bold cropping glistened amid the dark umbrage of the pine-clad hillside. Creede, moreover, was on the northern borderland of the famous San Juan; the railway was already at its doors; the first discoveries became immediately productive; silver was in fashion; development therefore advanced apace, and the results were made apparent in smelter returns. Cripple Creek, on the contrary, was discredited by its position, its former record, its lack of transportation and the smallness of the first discoveries. Silver mining was then at its best; the fashion of the hour favored the camp at the headwaters of the Rio Grande and underestimated the discoveries heralded from the snow-clad peak which had long been a landmark to the wayfarer across the plains.

The logic of events is however incontrovertible. When 1893 came Cripple Creek was still pegging away without any notable results; Creede had leaped into a silver producer of the first rank. Cripple Creek that year yielded only $583,010 in gold, while Creede gave $3,100,000 in silver. In July, 1893, the Indian mints were closed and the silver market collapsed. Mining was completely disorganized, and the business activities of the State were temporarily paralyzed. Then, in the hour of distress, the bankrupted silver miner looked toward the new gold field and with a courage born of despairing hope he trudged across the hills and set to work with dogged perseverance to dig holes upon hillslopes whose grass-covered debris gave scant suggestion of underlying ore. The smooth surface underwent an overturning; nature seemed to have the measles; gophers of a larger growth appeared to have invaded the former cattle range; a thousand prospect holes were put down everywhere and anywhere, the absence of outcrops being neglected until the eager search became rewarded by the finding of a score of veins of rich, golden ore. Cripple Creek instantly leaped to the front. In 1893 the yield rose to $2,100,000. Colorado faced the future with renewed courage and redressed the decline of her silver industry by the enthusiastic development of new resources.

In 1894 came the labor strike, whose evil effects were largely traceable to the vagaries of an imbecile executive and the hysteric vaporings of the Colorado Springs press. The energies of the camp were for many months either stilled or else diverted into unproductive channels. The production that year only reached $2,900,000, but in 1895, unhampered by strikes and aided by improved transportation and reduction facilities, the yield approximated $8,000,000, putting Cripple Creek at the head of the gold-producing camps of the United States.

New mining districts are often quoted as exhibiting unique geological conditions. Cripple Creek is frequently stated to have upset old theories and to have nonplussed experienced miners. It is easier to write last year's almanac than to foretell the future. In the light of extensive exploration we can appreciate the facts which caused so many widespread misconceptions regarding the ore occurrence, and at the same time understand the reasons for the slow growth of early discovery.

GLIMPSE OF SCENERY AS THE CRIPPLE CREEK REGION IS APPROACHED.

Owing to their position, on hillsides almost bare of trees, facing south and at an altitude of 9500 feet above sea level, the rocks themselves, mostly of a fissile structure, had been shattered by frost to such an extent as to cover the solid formation with a notable thickness of debris to which the hardy grass had given a kindly covering. Hence the infrequent rock exposures. Moreover, the larger number of the veins consist essentially of country rock impregnated with minute quantities of valuable gold-bearing minerals without the deposition of any large percentage of gangue material, such as quartz. The silicification of rock along ways of water circulation, which replaces soft decomposable minerals by a hard insoluble one, and creates lines of resistance to weathering such as eventually stand out alone above the surface, had not been actively at work and the outcrops which it ordinarily tends to form were therefore conspicuously rare.

The first prospectors came from the neighboring districts of Leadville and Gilpin, and failing to recognize in the conditions of the new camp any resemblance to the conventional vein systems of the one or the limestone contacts of the other region, they hastened to term phenomenal what was only new to the limited knowledge of an essentially local experience. It was the so-called practical miner (as if a real miner or mining engineer could be otherwise than practical) who condemned Cripple Creek, and it was the fledgling from the laboratory who gave color to the statement that scientific men refused to consider the new gold field seriously. As a matter of fact, many experienced mining engineers of the writer's acquaintance, while they deprecated exaggerated descriptions based on insufficient development, such as circulated during the reaction of the autumn of 1893, yet were strong in recognizing the fact that the discoveries were valuable and far-reaching in importance.

Nor is the geology extraordinary when viewed in the light of an adequate experience. The determination of the country rock as consisting largely of masses of andesite breccia covering the basal granite is quoted by the Western miner as an unfamiliar geological environment, and the use of a previously little known rock term strikes the uninitiated as indicative of conditions heretofore unrecognized. It is a fact, however, now pretty well known, that the "porphyry" dikes accompanying the fissure veins of the old districts of Gilpin and Boulder counties are composed of a quartz andesite; it is interesting also to remember that in San Juan, Ouray, Dolores and La Plata counties, in southwestern Colorado, there is a mass of andesite breccia, of a geological age contemporaneous with that of Cripple Creek, whose thickness is to be measured in thousands of feet and its extent in hundreds of square miles. Moreover, the rock formation and vein structure of our American gold field finds a prototype in the old mining regions of Transylvania in Europe and in the Hauraki district in New Zealand. In the last named gold field there occur conditions exhibiting a most remarkable parallelism with those obtaining at Cripple Creek. All of which merely accentuates the known orderliness of nature's operations, which, when they appear unprecedented, seem such only because of our limited observation.

No recorded mining region exhibits evidence so confirmatory of the most recent theories on ore deposition as does Cripple Creek. It has been said by some that it upset preconceived theories. Far otherwise. No theory is of course impregnable; it is but a tangent to the circle of observed facts and represents the direction of conclusions covering a small arc of that circle; therefore no theory is final or immutable. Nevertheless it is one of the most striking features of the new camp that it corroborates the views of those who seek to derive ore deposits from ascending mineral-bearing solutions and emphasize the connection between ore occurrence and geological structure.

The basal granite of the Pike's Peak region has been intruded and covered by a complex of volcanic rocks. The masses of andesite tuff and breccia which constitute the prevailing country are penetrated by later dikes of andesite, nepheline basalt, sanidine phonolite and allied varieties. The lodes consist largely of dikes rendered gold-bearing by their impregnation along lines of fracturing whose origin may be traceable to contraction consequent on cooling. Other ore deposits not actually following such dikes but occurring as veins in the massive formation have nevertheless directions recognized as sympathetic to the dike fractures. The chief and immediate result of this type of vein structure is the multiplicity of fracturing and the repetition of vein walls. This "sheeting" of the rock encasement and of that gold-bearing portion constituting the ore itself is a feature of great importance in the actual work of mine exploration. It is noticeable that the ore streak when following one of these fracture planes may maintain its continuity for a certain distance and then either end abruptly, decrease in size or scatter itself, only to resume its regular course along a neighboring parallel "wall" while the original wall goes on smooth as a skating rink, devoid of ore and delusive as a promoter's dream. This structure may cause the continuation of a rich ore body to be found not in a straight line with its last determined position but to one side, in the claim adjoining the extension claim rather than in the latter. Moreover ore is found distributed not along one but several such fracture planes so that certain veins consist of a parallel series of ore bearing streaks distributed over either a portion or the whole of the thickness of a dike. Cross-cutting is therefore imperative. Ore may occur not only along both of the boundaries of a dike but also in a neighboring dike or indeed along independent but sympathetic fractures within the massive country. The andesite breccia itself is traversed by several well developed systems of joints which have served as waterways along which gold bearing minerals have been precipitated. This has resulted in the formation of several large, less regular and less rich, ore deposits of the stockwerk type, whose want of definition has proved puzzling to the mine superintendents.

Generalizations are proverbially dangerous. In the Cripple Creek area they are unusually so because of the notable diversity of vein structure. It is this which caused, in its early days, so many con-

flicting and misleading statements regarding the formation of the district. To the geologist this diversity is of great interest and a discord which investigation discovers to be a fine harmony of evidence on the genesis of ore deposits. To the miner it is perplexing; and to the promoter it is a snare and delusion.

There are fissure veins of the most classic type cutting clean through changing rock formations, such as the Independence; there are dikes of volcanic rock unaltered save by a fracturing followed by a minute percentage of mineral deposition, such as the Elkton, Moose and others, there are narrow, but very rich, seams of jasperoid quartz following contraction fissures such as the Buena Vista and Victor veins; and there are irregular and apparently structureless, but really definitely arranged, ore bodies such as the Summit and Deerhorn mines.

STREET SCENE IN CRIPPLE CREEK IN 1891.

Conditions diverse as these are apt to be confounded in the desire to apply the experience of one part of the district to another less developed portion of it. The common practice of quoting the success of a well-developed mine as indicative of the probable outcome of the exploitation of a neighboring prospect is likely to prove more than usually misleading because the geological environment of the two may be as dissimilar as though they were on separate continents.

The ores are of striking beauty.* Fluorspar is a prevalent and characteristic gangue. Native gold is frequent in the oxidized ores and gives place to combinations with tellurium as depth is attained. The purple fluorite, the silvery telluride and the reddish-yellow gold form a color combination of rare beauty to be appreciated even by the most untechnical visitor. The investigations of Dr. Richard Pearce and the chemists of the U. S. Geological Survey have gone to prove that the native gold has been derived from the decomposition of pre-existing tellurides, that the surface ores carry telluric oxide and that the relative percentages of gold, silver and tellurium indicate the presence of both calaverite and sylvanite. Another telluride, namely, petzite, is also occasionally recognizable.*

TOWN OF CRIPPLE CREEK IN 1894.

Such are to the mineralogist the most evident characteristics of the ores. To the geologist, however, the most remarkable feature of a great part of the output of the mines is its identity with country rock. In its early days the camp sent shipments to the Denver smelters that looked more like ballast than ore. The very slight addition of foreign mineral required to change valueless rock into valuable ore was one of the surprises of Cripple Creek. The Independence, for example, sent many carloads easily recognizable as Pike's Peak granite, differing from the normal rock only in a decomposition of the mica and the occurrence of gold amid the remaining oxide of iron. Even when the lode penetrated from the granite into the andesite, the habit of the new rock encasement was as readily recognized as previously the structure of the granite had been. It was neither then nor now necessary to look outside the vein to determine the character of the enclosing rock. How purely commercial and essentially unscientific is the distinction between ore and rock, between veinstuff and country rock, is illustrated by most of the ore bins and dumps of Cripple Creek, whose testimony has gone far to prove that lodes are for the most part composed not of injections of foreign material filling open spaces, but the slow replacement of rock in place along lines of maximum porosity or minute multiple fracturing.

To the metallurgist a new field of activity has been offered. The bodies of rich telluride ores previously found in Boulder, Hinsdale and La Plata counties have been so restricted in size as to render their reduction at the mine unnecessary in the face of excellent smelting facilities, made available by cheap railroad transportation. At Cripple Creek the quantities of these ores have been found to be large and so siliceous that the output threatened to exceed the digestive capacity of the lead furnaces. Moreover, the presence of only a minute percentage* of sulphur and the absence of copper and lead ores invited chlorination and cyanidation to enter the field of competition. Both have done so successfully. At present the two chlorination† plants have a combined capacity of about 85 tons per day, and the two cyanide‡ establishments 130 tons. The former have necessarily been compelled to include a careful roasting among their operations, while cyanidation has been able to give an excellent extraction without such preliminary treatment. Now, however, the ores of the lower levels have brought with them the need for a similar preparation for the cyanide process, and the two leaching methods will henceforth compete on a more equal footing. The near future will see an increase in baseness as the ores of the deeper horizon are exploited, and with these changes will come difficulties requiring further metallurgical skill to overcome them.

The district produces an average of about 425 tons per day. Of this total 200 tons goes to the smelters and the remainder to the leaching plants. The average gold contents approximate 2½ ounces per ton. During 1895 the Omaha & Grant smelter purchased 40,000 tons of Cripple Creek ore, which averaged $78 per ton, or 3½ ounces of gold. The eight millions produced in 1895 were extracted from about 150,000 tons. Facts such as these emphasize the comparative smallness of the tonnage and, per contra, its compensating richness. The Witwatersrand region crushes in one month twice as much ore as Cripple Creek produced in 1895, but the grade of the latter was about six times as high.

The output of the district is regrettably irregular, varying within a recent period from 300 to 700 tons per day. This is due to the limited development work required by ore bodies of unusual richness and proportionate smallness; it is traceable also to the ups and downs of the demands of a speculative stock market. But it is particularly caused by the operation of the leasing system. Many companies own claims, but are barren of working capital. It is then a common practice to cut up the territory into 100-foot divisions and lease them to parties of miners for periods ranging from three months to a year. The leasing system is much overrated. It is usually the last resort of a perplexed management or an exhausted mine. It results in gutting the ore reserves and throws the property back into the hands of the owners in a depleted and dilapidated condition. In certain sections of the Cripple Creek area leasing is very general, and is due largely to the fact of the ownership of claims by inexperienced persons. To its working the fluctuations in the output are mainly due. As time wears on and matters are put on a better basis and under more experienced direction, this factor will be slowly eliminated and the maintenance of a steady production be rendered possible.

No account of the present condition of Cripple Creek would be complete without a reference to the epidemic of stock speculation which appears to accompany the operations of a new gold field with the stale iteration of the sea serpent story in the silly season of the year. In January the Secretary of State received $52,800 in payment of the registration fees of new mining companies. This would be less regretable were but a proper proportion of the amount spent in furthering the industry that contributed it, or if it represented an adequate ratio of expenditure in actual mining work. The original subdivision of interest which was intended to distribute the expense of mining among several where it exceeded the capability of one has now progressed so far that thousands of shares can be bought for a few dollars. The word "share" has lost its meaning—what share in a mine is represented by paper telling that its possessor owns so much stock in a million-dollar company floated on the flimsy basis of a hungry looking pocket hole? The whole business is fundamentally bad and is to mining what the bookmaker and bunco man are to legitimate horse-racing.

That many will be bitten is manifest. Nor is it particularly regrettable in some ways, seeing that so many of the transactions are based simply on the elementary philosophy that, though the mine be valueless, some one more foolish than the buyer will be found on whom it or its stock can be unloaded. The mine itself is usually lost sight of; it is merely an excuse for childish gambling. Not much sympathy need be wasted on those that get caught. It is an old story. The experience of past mining excitements gives warning which if unheeded brings merited punishment.

Mining is to-day a sound business; those who treat it as being otherwise deserve to fail. Good mines properly managed are plentiful at Cripple Creek without this absurd "speculative investment" of the irresponsible promoter. Honest advice from properly qualified and thoroughly experienced technical men can be had for fees less than those of the other professions, and if people choose to plunge recklessly on the suggestions of interested schemers, they must expect a fitting finale to their vagaries.

Stock speculations and share epidemics will rise and wane, but the development of the mines goes on unresting, and it is the pleasant duty of the writer to record the belief that Cripple Creek is destined to a future of long-continued productiveness.

STREET SCENE IN CRIPPLE CREEK.

---

THE world's record for the greatest number of ems set in one hour on a Mergenthaler linotype was broken recently by B. J. Mensing, a compositor of the *Post-Dispatch*, at St. Louis, Mo. In that time he set up 10,685 ems, 585 more than did Green in Chicago, who held the former record. The event was a seven-hour contest between Robert Erancis of the *Globe-Democrat* and B. J. Mensing for a purse of $200. About $1000 changed hands on the result. Mensing won the contest, setting 74,100 ems to 65,800 by his opponent, and had ten minutes lost time.

*These minerals have the following composition: Calaverite, 55.5% tellurium, traces of silver, 44.5% gold; sylvanite, 55.8% tellurium, 15.70% silver, 28.50% gold; petzite, 32.68% tellurium, 41.86% silver, 25.60% gold.

*The amount of sulphur in the ores averages under 2 per cent. Some of the Bobtail ore reached 5 per cent, this being the maximum. The percentage is increasing as depth is gained and additional roasting facilities are becoming required.

†The Lawrence works have just been burnt down. They will be rebuilt immediately. Those at Gillett will be enlarged.

‡The largest is at Florence, the oil city of Colorado. Its capacity is about 90 tons daily, shortly to be increased to 300 tons. The first cyanide mill erected in the district is the Brodie plant, with a 40-ton capacity. In addition to these leaching plants, there are four or five stamp mills treating the oxidized ores with very varying results.

## "Invention"—The Indefinable Requirement of the Patent Law.

NUMBER II.

By W. H. SMYTH, Mechanical Expert and Consulting Engineer, Berkeley, Cal.

In recent years the scope and ramification of mechanical and other industrial processes have become world wide, effecting every act of life. Consequently the points of contact and coincidence of new devices have become more numerous, and opportunities for striking novelties have become fewer and fewer. It is under these circumstances that this subtle metaphysical—one is tempted to say occult—idea of invention has been given prominence, and the patentability of devices determined by fallible personal opinions, instead of facts and evidence.

The legal text-book writers, with every intention of rendering assistance to work-a-day men on a subject of practical importance, in dealing with the accepted idea of invention are irresistibly forced in the mazes of metaphysical and philosophical abstrucities.

But admitting what the text-book writers and the courts say on this subject, that invention does exist, though indefinable; that it is an "impalpable something" wholly within the domain of metaphysics and philosophy, does it not seem utterly illogical that the determination of these subtleties should be left to mechanics, chemists and lawyers.

Would it not be more reasonable that the examiners in the Patent Office, instead of being versed in the arts of their departments, be metaphysicians trained to determine mental principles and operations. And above all, would it not be more logical to try patent cases involving these issues before this same kind of experts, than as at present before judges who are neither specialists in the art involved nor metaphysicians, but simply men trained to determine and discriminate in matters of fact. "The mental process of invention, in most cases, is very similar to that of discovery. * * * * The distinction between them is almost always overlooked, sometimes its existence is denied by the courts." (Merwin.)

There is, as has been hinted at, still another phase of this question, namely, that "invention," instead of being the result of a peculiar, unique, and altogether exceptional mental process, is simply the result of conscious or unconscious reasoning on data supplied by observation, and in all respects similar to other mental processes, in which observation, memory and reason take part.

This view was set forth at some length in a recent number of the *Engineering Magazine*, under the title "Is the Inventive Faculty a Myth," by the present writer. It is not necessary to the present argument, and is simply referred to as offering a possible reason for the difficulty of defining wherein invention differs from other rational processes, also as suggesting the justice and advisability of determining first the *existence* of "invention," as interpreted by the courts, beyond question. Before demanding its presence as a statutory requirement to a common contract, "* * * * the statute demands a peculiar process of mind as the characteristic of invention. * * * * The statute is so interpreted by the courts. * * * * It is impossible to arrive at the patentability of an improvement in any other way." (Merwin.)

As illustrating how this demand for the presence of "*invention*" works in practice, take this case:

The Patent Office refuses to grant a patent, not on account of lack of novelty, for no anticipating device can be found, it is admittedly of great practical importance, but it is refused simply on the ground of want of invention.

After exhausting argument the applicant finally says: "Surely we must be quibbling about words. What does the Office mean by 'invention?' What has the examiner in mind which he says this device lacks?"

To this there is no reply except the arbitrary exercise of power.

This is not a suppositious case, for of late years it is becoming of frequent occurrence.

Before drawing conclusions from all the foregoing, I desire to make some remarks, which, while they do not bear directly on the present argument, do bear on the subject of invention in general, and will probably serve to give point even to the present matter.

The courts and authorities are agreed that "invention involves the spontaneous conception of some idea not previously present to the mind of the inventor" (Robinson), but that wise judgment in selecting and combining ideas already there has no part therein, and that "reasoning is not invention."—(Merwin.)

It is justly inferable, therefore, that inventive ideas do not depend upon other ideas, or they would not be spontaneous, but simply inferences.

This being so, it logically follows that a mind devoid of ideas, if such were conceivable, would be as fertile a field for invention, as one rich and full of ideas, concepts and observations.

Or to put it in another form, that in a mind stored wholly with, say, *legal* concepts and ideas, a *mechanical* invention is as logically probable as in a mind filled with observations of every variety of mechanical elements and combinations.

The born blind should invent new colors, and the born deaf compose music.

At the risk of opening the door to a metaphysical argument, which I would avoid, being a mechanic and not a philosopher, and my present object being the wholly practical one of suggesting a way of taking patents out of the misty region of metaphysics into the domain of facts, where they belong, still, I can not refrain from suggesting that when the first sentient atom perceived inert matter, the concept of resistance originated, the first embryonic idea, with and from which all others have arisen in continuous and unbroken sequence.

In every attempt to disentangle "invention" from other forms of thought much stress is laid upon the idea of its instantaneousness of operation. This, I take it, is a relic of ignorance, for we now know that even thought is not instantaneous. Rapidity is chaarcteristic of all thought. Is it not possible that behind this question of time lurks hidden the solution of many of the difficulties of "invention" as interpreted by the courts?

The phonograph is frequently cited as one of the most perfect illustrations of inventive genius.

In this I fully concur, and, further, I hold it to be an equally beautiful example of pure inductive reasoning, and that the idea of the phonograph being "spontaneously conceived" is simply unthinkable. For *its* conception a distinguished line of ancestry was required, among which as near kinsfolk were very sturdy ideas of sound waves, elasticity of diaphrams, and whole troops of mechanical ideas. And for a birthplace a mind furnished with every achievement of modern science and lighted by logic as clear as noonday.

Spontaneously conceived, forsooth!

In contrast to this may be mentioned the illogical unreasoning and unmechanical attempts of Von Kempelen, and later of Faber, to make a talking machine by copying the human speech organs, ignorantly overlooking what simple observation should have taught, that the human mouth, with other functions, is a tasting device, a grinding apparatus and a fighting machine, and only last and least of all, and incidentally, is used for talking, for which purpose, by the way, it is so ill adapted that it takes years of adjustment to do in the way of talking what the phonograph does instantly it is made.

"Reason is unraveling and invention is weaving of thought. Reason is analytic, invention is synthetic."—(Merwin). The error of this lies in the fact that reason is both analytic and synthetic. Illustrations, both analytic and synthetic, of convincing character could readily be given, but they would be out of place in this article.

"In the class under consideration (viz: inventions in which reasoning appears to be solely employed) reasoning is, indeed, the faculty most conspicuously used, but imagination must be employed before the reasoning begins, and in order that it may begin. For in these cases invention (imagination) is exercised * * * *in selecting out of a great many possible elements the particular element to accomplish the result desired.*"—(Merwin).

A pertinent inquiry is here suggested: "Invention" (Imagination) being unreasoning, how is it possible for it to select.

The quotation in effect concedes my whole contention. The courts and text-book writers first eliminate reason, and then immediately proceed to endow imagination with a power of *intelligent selection*, which *is* reason.

The better idea of imagination, I avoid the word "Invention" as being misleading, is just what the word implies, mentally *seeing images*, that is, a sort of mental pictorial scrap-book, in which is stored past visual observations (leaving out of consideration those who derive their principal impressions through other senses). *The imagination is just as inert and as incapable of conception, spontaneous or otherwise, as the physical scrap-book* used as illustration.

The circumstances of life and man's contact with nature disclose wants, deficiencies and lack of adjustment between him and his environment, which reason sometimes supplies by selecting directly from physical nature or by recourse to the scrap-book of reminiscent observations, i. e., imagination, image memory, alias visual memory, alias visualization, alias (though wrongly) invention.

A patentable combination, no matter how involved or complicated, is simply an aggregation of co-ordinating *individual* wants or deficiencies which have been *individually* supplied.

It would be an entirely erroneous impression to derive from my remarks, that because I question the existence of "Invention" as interpreted by the courts, I also discredit "Genius" or believe that poets are made not born. I hold in the profoundest reverence those giants of intellect, both past and present, to whom the world owes its masterpieces, and I do not fear that an intelligent inquiry into the causes of their greatness, no matter how searching, will detract from their glory or tend to diminish their number in the future.

It may possibly be urged by some, that tribunals of law when they adjudge the existence of the "Inventive faculty" simply adjudge the existence in certain individuals of capabilities, which enable those so gifted to accomplish results superior to anything which might reasonably be expected from the best minds and skill at present engaged in the cognate arts or callings; and when the same tribunals adjudge that a certain thing is an invention, they simply adjudge that it is distinctly superior to and different from anything that might reasonably be expected from the skill of the best minds versed in the arts involved.

If what has gone before is not considered to meet this objection, then a complete answer is to be found in the decisions of the United States Supreme Court, in which it has been held time after time that simple superiority, or superiority accompanied by novelty, either in device or result, does not entitle it to be considered an invention, or entitled to the benefit of the patent statute.

On this point I refer to the following cases taken at random:—

Union Edge Setter Co. vs. Keith, 139 U. S. 530. It was decided that the claim lacked invention, though the result was a more perfect machine.

Bussell Trimming Co. vs. Stevens, 137 U. S. 423. Patent performed the work it was designed to accomplish in a better and more workmanlike manner, and yet was held to lack invention as being improvement only in degree.

Consolidated Roller Mill Co. vs. Walker, 138 U. S. 124. Conceded that the peculiar arrangement of patentee is attended with better results than previously, still this would not necessarily sustain patent.

Aaron vs. Manhattan Ry. Co., 132 U. S. 84. Though patentee was entitled to the merit of being the first to conceive the convenience and utility of a gate opening and closing mechanism which could be operated efficiently by an attendant in a new situation, still this merit might not sanction patent.

Though taken at random, these serve to show that superiority is not a criterion of invention, nor is novelty, nor yet superiority and novelty, though they may indicate it; but the statute as interpreted by the courts demands something else, which is not simply superiority nor novelty, nor even a combination of these qualities.

It may of course be said that the devices in question did not disclose the degree of these qualities contemplated by the statute, but this simply carries the question back again to the original difficulty not a whit simplified. The determination of that degree would still be left to the arbitrary decision of individual opinion. But this line of argument is futile anyway, for it is not in accordance with the facts of the case.

The statute as interpreted *does* demand a prescribed character of mental operation or evidence of it in the device as a condition on the part of the producer to entitle him to the provisions of the statute.

It is urged that the law being practical simply attaches to words it employs—the meaning as nearly as possible given to them by common consent—and does not inquire if the words correctly interpret facts or whether there is any *real* foundation for them in fact. It simply uses them as the best means available to convey a meaning. Even this does not help the matter if that meaning be erroneous or confusing and a source of continued and increasing trouble, tending to thwart the very end for which the statute was formed.

That this is the case with the words Invention, Inventor and Invented is thoroughly appreciated by both the producers of new devices and lawyers whose business brings them into close acquaintance with matters relating to patents and patent litigation. And it is with this practical difficulty that the writer as a mechanic is interested at this time, and not with any fine-drawn metaphysical distinctions or modes of mental action.

It does not follow, of course, that because the present interpretation of a word in the statute works confusion and difficulty that therefore the statute is based upon a wrong idea and ought to be abolished. This paper has gone far wide of its intention if such an idea is deducible therefrom.

The patent statute stands a monument of human wisdom which has few rivals either in honesty of purpose or grandeur of result, and the writer would be the last to suggest anything which in his judgment would tend to weaken or cripple its beneficent working. The very opposite of this is the intention, which is simply to suggest the elimination of those elements which tend to obscure the meaning and balk the evident purport of the statute.

The object of the patent law was undoubtedly to encourage and reward industry and intelligence when directed in channels beneficial to the commonweal. There certainly was no idea of rewarding certain supposed freaks of nature for the possession of a peculiarity they could not help. Therefore, putting aside any metaphysical controversy, inasmuch as the criteria of one of the requirements to the patent contract are so utterly indefinite and the determination so impossible, does it seem the part of the practical common sense and business-like procedure to eliminate the element of confusion? All other matters which have been found by practice to be good and desirable would remain unaffected.

In fact, the substitution of the idea conveyed by such words as *discovered, produced, thought out, reasoned out* for that which now attaches to the third requirement of the patent contract would work no change whatever in the spirit of the statute to reward intelligent industry, but would sweep away the cobwebs of mysticism which festoon the ideas supposed to underlie the word "Invention."

## Matte Smelting.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by W. L. AUSTIN, Ph. D., Denver, Colorado.

The desirability of some cheap and practical method of matting sulphide ores, without preliminary calcination and in localities where carbonaceous fuels are scarce or almost unattainable, has long been recognized. Although many attempts have been made to produce such a process they have been uniformly unsuccessful, until the writer discovered the effect of a strong current of preheated air upon a blast-furnace charge consisting mainly of heavy sulphides.

The chief cause of most of the disappointments and failures resulting from such attempts, even after the way in which success might be achieved had been pointed out, has been very properly ascribed to the fact that those having charge of such operations have usually been accustomed to other lines of smelting and have been unable to break away from the customs and traditions to which they had become inured. If such an individual had acquired his smelting experience in an establishment where lead ores were treated, he would naturally build for pyritic smelting purposes a furnace greatly similar to those with which he was most familiar, and then endeavor to force the altered conditions of charge and fuel to meet the requirements of the apparatus he had constructed. With a singular fatality the use of lead-smelting furnaces has been general in experiment with pyritic smelting, and this practice has very much retarded the advance of this branch of industry.

Mr. Lang emphasizes the futility of adhering to preconceived notions of smelting in dealing with this new method of ore treatment. He expresses his views in the following language (see page 28 of his book): "It is only when we get away from lead smelting, discarding its mixtures, its slags, and to a large extent its apparatus, that we begin to realize the extent and variety of application and the suitability in diverse circumstances that characterize matte smelting.* It is for this reason, if for no other, that the application of the methods of lead smelting to the art have not been found to succeed, and why metallurgists of that school have not been, and are not likely to be, successful in their experimenting."

In the early, experimental stages of pyritic smelting circumstances compelled the use of blast furnaces built originally for other methods of smelting, and it is probably largely due to this precedent that later (with what might be supposed to be commendable conservatism in adhering to appliances which under skillful management had been temporarily made to accomplish certain purposes) furnaces have been built on similar lines, without sufficient consideration being given to the altered conditions under which they must be operated. A lead furnace, although admirably adapted to the purpose for which it was designed (i. e., the reduction of metallic lead from ore mixtures in which that metal is a prominent feature), is wholly out of place if used to smelt pyritic ores when it is desired to turn to account their fuel qualities. In speaking of lead furnaces the usual rectangular type which is in common use in Colorado is referred to. Such furnaces have been constructed measuring 140 inches by 36 inches inside of jackets at the plane of the tuyeres and about 20 feet in height, with one or more tiers of water jackets. The fact that the usual crucible has been replaced by a bottom plate supported upon screw jacks is not considered as an essential deviation from the general lines of the type referred to.

That furnaces built on the lines of those designed for smelting lead ores are not suitable for pyritic smelting becomes all the more patent when the two classes of fuel operated upon in the respective processes are considered.

The blast furnace fuels in common use (coke, charcoal, or anthracite) are such as present the combustible element (carbon) in a highly concentrated and comparatively pure state. These are prime requisites in fuels to be used for this purpose, and although other less concentrated forms of carbon have been advocated from time to time as substitutes, their adoption has not come into general practice.

In the mineral or artificial sulphides and arsenides the above requirements or a blast furnace fuel are found in a high degree of perfection, with this difference—the combustible components are not, as in the case of coke, practically a single element—carbon—but a combination of iron with sulphur or arsenic. The following table is given to bring out as prominently as possible the main features wherein these two classes of fuel radically differ:

COMPARISON OF CARBON AND IRON SULPHIDES AS FUELS.

| | CARBON. | IRON SULPHIDES. |
|---|---|---|
| Porosity | Great. | Practically none. |
| Surface exposed to blast | Very large. | External surface only. |
| Behavior in furnace | Retains its form until consumed. | Decrepitates, melts and drops to bottom of stack. |
| Products of combustion | Gases. | Mostly fluids or solids. Comparatively small amount of gases. |
| Principal direction of heat | Upward. | Downward. |
| Area of smelting activity | Large. | Restricted. |
| Chemical composition | Practically a single element. | A combination of elements which must be dissociated. |
| Time allowed for action | Indefinite, or until consumed. | Very short—only from moment of becoming fluid until globule has dropped past the tuyeres. |

*In using the term matte smelting it is assumed that Mr. Lang has reference here to pyritic smelting.

As these fuels are so very far apart in their physical, as well as chemical, properties, it would be only reasonable to suppose that some modification of the conditions under which they may be advantageously employed would be required in applying them to economic purposes.

It seems, therefore, hardly necessary to point out that an apparatus designed for burning coke as fuel (coke being a porous mass with large surface exposed to the action of the oxygen of the blast, and which maintains its solid condition and position in the charge while undergoing combustion, and passes directly from the solid into the gaseous state without any noticeable fusion) is not a suitable one for burning the various forms of pyrites, which are dense solids, practically impervious to penetration by the oxygen of the blast and possess the other characteristics given in the above table, yet these differences are ignored by those using lead furnaces for pyritic smelting.

When thrown into the blast furnace, pyrites part with some of their sulphur at a comparatively low heat, and the protosulphide of iron which remains, being readily fusible, melts in advance of the other slag-building components of the furnace charge; and, when so melted, trickles down through the subjacent mass. In dealing with sulphides as a fuel, there is, therefore, the further radical difference to be considered in that we have to do with a liquid combustible of a very dense nature, and the oxygen of the blast can only act on the limited outside surface of the heavy viscous drops as they fall through the charge. Furthermore, coke being a solid, retains its position in the furnace charge until it has been consumed by the action of the blast, whereas the liquid drops of iron protosulphide rush rapidly through the few feet of space which intervene between the point where liquefaction takes place and that of the entrance of the blast, and are only exposed to the action of the oxygen of the air for a very brief period. On account of the fluid nature of the fuel operated upon, time becomes an element of importance in the burning of sulphides, and the conditions, therefore, under which the combustion of these two classes of fuel should be allowed to proceed in order to derive their relative maximum efficiency are manifestly different.

The resulting products of combustion are as markedly distinct as the physical natures of the respective combustibles. In a coke-burning furnace the products of combustion are mainly gases and the tendency of the fire is to creep upward with the ascending current of gases, whereas in a sulphide burner they are largely fluids or solids, and the tendency of the fire is to follow the slag and matte downward. As a natural sequence, in a sulphide burner the stronger the blast the larger will be the amount of sulphide consumed and the hotter the lower part of the furnace will become, always supposing that the pyrites are supplied in sufficient quantities and in the proper manner to meet the requirements of the smelting operation.

An illustration of the downward tendency of heat in a sulphide burner was given in the early experimental work with this process, in the case of such a furnace operated at a point where only a very small amount of pyrites could be placed upon the charge on account of local scarcity of that material. It chanced one night that this furnace "froze up" from lack of fuel. The "freeze up" was complete. Bars were passed into the furnace on one side and out through the tuyeres on the other side, without discovering any fire; nor was any light at all disclosed on removing the breast. As the furnace was filled with charge nearly up to the feeding door, there was no hope of resuscitating it by the addition of ordinary fuel, for any coke thrown in, if indeed it could be even set on fire, would merely burn on the top without helping matters in the least. To ascertain whether there was any life in the furnace at all the tuyeres were replaced, the aperture in front closed and the blowing engine started up at full speed. Then it was that at the charging door of the furnace a faint bubbling could be heard, showing that somewhere in the charge a small reservoir of molten matter was still in existence and the blast passed through the charge freely. Now, as previous experience had taught that, by the help of the vibration caused by the blower, wherever air could find openings upward, usually fine sulphides could be made to sift downward through the same passages; therefore the attempt was made to reach in this way the molten matter which had been heard to bubble. It was expected that if the live fuel or molten matter alluded to could be reached, the pyrites so introduced would catch fire and that with their help the charge could be brought to fusion and the furnace washed out.

To accomplish this purpose three tons of clean pyritic "fines" were thrown into the furnace at one time in a mass, without the addition of any carbonaceous fuel whatsoever. The effect was startling, for within half an hour the blast had to be slackened up, as the furnace had returned to its normal condition and the heat in the lower part was so intense that there was danger of the base plate giving way.

This incident illustrates one point of difference existing between the two classes of fuel, carbon and sulphides, when applied in blast furnace practice, and explains in a measure why furnaces designed for burning coke are not suitable for using sulphides. Those who have experimented with pyritic smelting, using for the purpose a furnace designed for lead or copper smelting, will have encountered various difficulties which have caused great annoyance, perhaps forced a return to the use of coke, or even an abandonment of the purpose altogether.

That such troubles should occur is only to be expected when using an apparatus for a purpose other than that for which it was originally intended. The coke-burning furnaces, with their provision for hot ascending gases and preparative treatment of charge, do not meet the requirements of the case where readily fusible sulphides are the material to be acted upon. In pyritic smelting the volume of ascending gases is comparatively small, and it is not desirable to have the raw sulphides undergo any preparatory treatment before coming into the actual smelting zone. In a properly constructed pyrites-burning furnace the heat on top of the charge is not great enough to melt sulphur, and as a natural result that element sublimes off and may be readily condensed.

In any coke-burning furnace there is always an immense volume of gases (the products of combustion) which must be taken care of. These gases, acting upon the superincumbent charge, prepare it, where such preparation is necessary, for the smelting zone further down, and therefore the shaft of the furnace is lengthened out in order to afford the gases an opportunity for doing this work. If it is attempted to operate such a furnace with a charge carrying large quantities of raw sulphides and more or less coke, the heat carried upward by the carbonaceous gases, etc., causes an incipient fusion of the said sulphides before it is desirable that such should take place, and as a natural result there is a sticking up of the whole mass, adhesion to the furnace walls, "bridging," "scaffolding," etc. So it is evident that the high stacks of the lead-smelting furnaces are not only unnecessary but positively detrimental to the proper carrying out of pyritic smelting. There are no higher oxides to be reduced, and no suitable gases to reduce them even were they present, and as the main tendency of the heat is downward, the economy usually effected by absorbing in the charge the escaping sensible heat contained in the products of combustion is not so apparent. In fact, in pyritic smelting, which is essentially an oxidizing fusion of the furnace charge, and not a reducing fusion, the high stack has no function to fill and is very much in the way.

As would naturally be suspected where two fuels of such radically differing properties are concerned, their simultaneous employment in the furnace leads to manifold complications and should be avoided, if possible. Apart from the fact that coke has a much greater exposed surface and therefore, on this account alone, will naturally burn before the protosulphide of iron (with its limited, dense exterior) is attacked at all, the latter possesses the additional disadvantage of being a composite fuel. The elements—iron and sulphur—which are combined in the protosulphide must first be dissociated from each other before either is in a condition to unite with the oxygen of the blast. This dissociation can only be accomplished by the expenditure of a certain number of heat units, and if these are not forthcoming the protosulphide is allowed to pass by and the more exposed coke is attacked in preference. So, it is a matter of fact that where coke and pyrites are exposed side by side to the action of an air blast the former will be attacked first, both on account of its greater exposed, cellular surface and because it is practically a simple element. Such being the case, what results would naturally be expected from employing a high stack and using both fuels—coke and iron protosulphide—in the smelting column? If a high column is used, sufficient coke will have to be added to keep the mass open and loose, and this amount may equal or exceed that which would have been necessary to fuse the charge without considering the thermal qualities of the pyrites—in other words, about the same amount of coke is requisite in fusing down a high column of sulphides as would be needed in smelting the same weight of material after it had been calcined in the usual manner; and, therefore, nothing would be saved except the cost of calcination, and that would be largely offset by the small degree of concentration effected in smelting the raw ore with coke.

If, on the other hand, a low smelting column is used the coke burning first fuses the protosulphide of iron, which drops through the neutral gases without being oxidized. In such a case, where much coke is used, the iron pyrites loses scarcely more than one of its sulphur atoms and the resultant protosulphide fuses and passes out of the furnace as a matte, without undergoing the decomposition calculated upon. The result is a disarrangement of the furnace charge due to the withdrawal of the iron as protosulphide, which it was intended to burn to protoxide and in that form to combine with the silica present to form a fusible slag. In this way there accumulates in the furnace a silicious mass which darkens the tuyeres, and in the case of brick furnaces assists in burning out the walls.

If small quantities of coke are used, a see-sawing motion is set up in the charge. The coke, as has been explained, burns first, and, melting down the sulphides, produces an undesirably large amount of matte. Sometimes the quantity of matte will equal or exceed the amount of slag coming out of the furnace. Then, as the coke becomes scarcer in the charge, the protosulphide of iron burns, the relative quantities of slag and matte produced are reversed, the amount of matte is not sufficient to protect the metals it is desired to save, and the slag is found to assay high. So that, in any case, whether with a high or low smelting column, the addition of coke to the charge (provided the latter contains sufficient iron sulphide to furnish the necessary thermal units for the operation) produces complications, and it is very doubtful whether such practice can compete upon equal terms with ordinary reverberatory or blast furnace matting. In isolated instances conditions may arise where such a hybrid process could be recommended, but they will be found to be few, and in any case where the percentage of iron sulphides (or arsenides) in the charge can (by partial concentration or otherwise) be brought up to 65 or 70%, the addition of coke is wasteful and an unwarranted extravagance.

One other interesting point in connection with the dissimilarity of the results produced in the burning of coke and iron sulphides should be mentioned. In coke-burning furnaces the products of combustion are to a large extent combustible gases, and the heat generated is, owing to the burning of such gases, distributed over considerable space and carried upward into the furnace. But in sulphide burners, the products of combustion being ferrous-oxide and sulphurous-acid gas, the heat generated is localized, remaining with the matte and slag, and only a small amount of the sensible heat is carried upward in the comparatively small volume of inert sulphurous acid gas and nitrogen. For this reason the smelting zone of a sulphide burner is small as compared with that of a coke burner, and the top of the charge is dark and cool, when the stack is closed, and when open it is covered with pale sulphur flames produced by the burning of the extra atom of sulphur driven out of the bi-sulphide of iron in the upper part of the shaft.

In the foregoing remarks the writer has endeavored to explain why it is not conducive to good work to employ the two dissimilar fuels, carbon and iron protosulphide, simultaneously. The attempt has also been made to show that, as the action of the latter is so very different from that of the carbon, it follows as a natural sequence that a furnace designed for smelting with coke can hardly be equally well adapted for use where sulphides furnish the principal source of heat, and least of all is the lead-smelting furnace a suitable apparatus for the purpose. Quoting again from Mr. Lang's work (page 29): "Speaking from the experience gathered in several years of experiment and research, I must say that it appears to me there is no possibility of successful matte smelting when following the lines laid down by the lead smelters. In fact, it is only when we leave the beaten track and strike out upon a road of our own that we put ourselves in the way of successful achievement."

The influence of temperature of blast upon the two classes of fuel, carbon and iron protosulphide, may be discussed in a subsequent article.

## Origin of the Roentgen Rays.

California scientists have given considerable attention to the new system of radiography, and if they are not first with the correct solution or explanation of the phenomenon, have at least made simultaneous discovery of what is evidently of transcendent importance concerning the rays. Fernando Sanford of Stanford University, who three years ago directed scientific attention thereto, Dr. P. M. Jones of this city, each pursuing investigations along the same general lines, have each reached the same conclusion, viz., that the rays emanate from the anode, and not, as heretofore supposed, from the cathode or from the glass. Prof. H. A. Rowland points out the same fact, and Elihu Thomson, another eminent authority, is equally positive in making a similar statement.

The latter thus sums up his conclusions:

1. Cathode rays are produced at lower exhaustions than give rise to anode rays that reach the glass.

2. Anode rays are best produced at the very highest exhaustions short of insulation.

3. Anode rays pass out through the glass of the Crookes tube; cathode rays (radiant matter) apparently do not.

4. Both anode and cathode rays cause fluorescence of the glass and possibly of many other substances.

It is not known whether anode rays cause fluorescence of any substances that are not so affected by cathode rays, and vice versa.

5. Anode rays are erratic in distribution from the anode surface. Cathode rays are of nearly uniform distribution, and leave the cathode surface at right angles.

6. Anode rays are not capable of being deflected by a magnet; at least, not after they have passed the glass. Cathode rays appear to be so deflected within the tube, and after they have traversed an aluminum window.

7. Diminishing the size of the anode concentrates and focalizes the rays emanating therefrom. Shaping the cathode into a concave cup gives rise to a focus of cathode rays by virtue of their direction being normal to the cathode surface.

The question suggests itself: Can anode rays reach and pass through a thin aluminum sheet which is at the same moment the cathode for the discharge? And, on the other hand, can cathode rays traverse the anode if of thin aluminum sheet? It is probable that opacity of the opposite terminal would be noted in these cases, and possibly deflection of the rays in each case near the terminal of opposite polarity to that emitting the rays.

Dr. Jones deduces the following:

1. That the X rays do not emanate from the glass, as advanced by Roentgen.

2. The X rays do not emanate from the cathode terminals.

3. A certain number of X rays emanate from the anode irrespective of the position of the cathode.

4. The number and intensity of the X rays emanating from the anode per se seem to increase directly with the vacuum and the current tension.

5. (*a*) X rays emanate from a metal plate within the tube, which is not connected to either pole but against which the cathode rays are projected.

(*b*) The greater the intensity and concentration of the cathode rays upon the unconnected metal plate the greater the number and intensity of the X rays which emanate therefrom.

6. An unconnected metal plate within the tube may project X rays when it is not connected to either terminal, and when a second metal plate intervenes, cutting off the cathode rays.

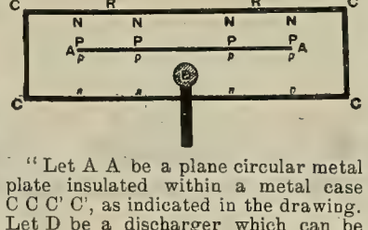
7. X rays are produced in their maximum quantity and intensity at and emanate from the anode when the cathode rays are focused on the anode terminal.

8. That the X rays focused upon a cathode terminal are reflected therefrom.

The last is in his judgment so far only hypothetical; the others he considers as being demonstrated.

Prof. Cory of the University of California at Berkeley, who has given the subject continuous practical investigation, thus sums up:

"Cathode rays positively electrify any solid upon which they impinge, probably by carrying electrified particles to the solid. The source of the Roentgen rays, then, is the solid upon which the cathode ray first strikes and gives up, or partially gives up, its negative charge. A second solid behind the first may be a source of Roentgen rays if the first solid does not take up the entire negative charge from the cathode ray."



Discussing the investigations and conclusions of his co-workers, Prof. Cory concludes:

"The Roentgen ray may, therefore, proceed from the anode, the florescent glass, a disconnected terminal or a grounded terminal, provided the shape of the tube and the relative positions of the electrodes be such that the cathode rays impinge on the anode, glass, disconnected or grounded terminal, respectively. That the anode, because it is the anode, may be the source of the Roentgen rays is probable, but the fact that in almost every case when the anode has been found to be the source of the rays the shape of the tube has been such that the cathode rays impinged directly upon it. The use of a disconnected terminal, even connected to the earth as the source of the rays, places the matter in a very different light."

The final word in these discussions is still unspoken. The subject is receiving thorough experiment, and the best scientific minds of the world are now busy on the discovery of the source of Nature's most recently revealed secret.

In connection with the matter the following, written by Lord Kelvin, F. R. S., on "the generation of longitudinal waves in ether," is supplemented. That distinguished leader in science says:

"In a short note published in last week's *Nature* I suggested an arrangement of four insulated and electrified spherical conductors with their centers in one line, giving rise to ethereal waves in the surrounding atmosphere, of which the disturbance in the line of centers is essentially longitudinal. But at any finite distance from this line there must be laminar or distortional waves of the kind expressed in Maxwell's equations. The object of my present communication is to show an arrangement by which a large space of air is traversed by pressural disturbance, or by waves essentially longitudinal, or by condensational-rarefactional vibrations, with but a very small proportion, practically evanescent, of laminar waves.

"Let A A be a plane circular metal plate insulated within a metal case C C C' C', as indicated in the drawing. Let D be a discharger which can be pushed in so as to make contact with A.

"Let A be charged to begin with, positively for instance, as indicated by the letters P P *p p*, N N *n n*, showing negative electricity induced by it. Let now the discharger be pushed in until a spark passes. The result, as regards the space between A A and the roof R R over it, will be either an instantaneous transmission of commencement of annulment of electrostatic force or a set of electric waves of almost purely longitudinal displacement, according as ether is incompressible or compressible.

"Hence, if the theory of longitudinal waves, suggested by Roentgen as the explanation of his discovery (for the consideration of which he has given strong reasons), be true, it would seem probable that a sensitive photographic plate in the space between A A and R R should be acted on, as sensitive plates are, by Roentgen rays. Either a Wimshurst electrical machine or an induction coil, adapted to keep incessantly charging A A with great rapidity so as to cause an exceedingly rapid succession of sparks between D and A, might give a practical result. In trying for it the light of the sparks at D must be carefully screened to prevent general illumination of the interior of the case and ordinary photographic action on the sensitive plate.

"The arrangement may be varied by making the roof of sheet aluminum, perhaps about a millimeter thick, and placing the sensitive photographic plate, or phosphorescent substance, on the outside of this roof, or in any convenient position above it. When a photographic plate is used there must, of course, be an outer cover of metal or of wood, to shut out all ordinary light from above. This arrangement will allow the spark gap at D to be made wider and wider, until in preference the sparks pass between A A and the aluminum roof above it. The transparency of the aluminum for Roentgen light will allow the photographic plate to be marked, if enough of this kind of light is produced in the space between the roof and A A, whether with or without sparks.

"The new photography has hitherto, so far as generally known, been performed only by light obtained from electric action in vacuum; but that vacuum is not essential for the generation of the Roentgen light seems demonstrated by an experiment by Lord Blythswood. As a result he exhibited a glass photographic dry plate with splendidly clear marking which had been produced on it when placed inside its dark slide, and held in front of the space between the main electrodes of his powerful Wimshurst electrical machine, but not in the direct line of the discharge. He also exhibited photographic results obtained fromt he same arrangement, with the only difference that the dark slide, wrapped in black velvet, was held in the direct line of the discharge. In this case the photographic result was due, perhaps wholly, and certainly in part, to electric sparks or brushes inside the enclosing box, which was, as usual, made of mahogany with metal hinges and interior metal mountings. I have suggested to him to repeat his experiments with a thoroughly well closed aluminum box, instead of the ordinary photographic dark slide which he used, and without any black cloth wrapped round outside. The complete metallic enclosure will be a perfect guarantee against any sparks or brushes inside.

"If the arrangement which I now suggest, with no sparks or brushes between A A and the roof, gives a satisfactory result, or if it shows a visible glow on phosphorescent material placed anywhere in the space between A A and the roof above it, or above the aluminum roof, it would prove the truth of Roentgen's hypothesis. But failure to obtain any such results would not disprove this hypothesis. The electric action, even with the place of the spark so close to the field of the action sought for as it is at D, in the suggested arrangement, may not be sudden enough or violent enough to produce enough of longitudinal waves, or of condensational-rarefactional vibrations, to act sensibly on a photographic plate, or to produce a visible glow on a phosphorescent substance."

ALTHOUGH Roentgen's work was so thoroughly done that little has been added to it by other experimenters, his view that the X rays differ from the cathode rays is not accepted by all physicists. Prof. Dolbear believes that the same results could be obtained from any source of light. He has given some attention to the matter, having, as long ago as 1892, photographed an iron star through an ordinary table top by means of electric sparks. He stated two years ago that all rays have similar characteristic properties, that what any ray can do depends upon the kind of matter it falls on, that what we know as light has no existence apart from the eyes, and that it has long been known that ether waves too long to be seen by the eyes could be made to produce photographs. Le Bon has reported to the French Academy of Science photographs obtained through plates of iron and lead by a three-hours' exposure to the light of a paraffine lamp.

LAST WEEK from San Francisco there went to Alaska a surveying party from the U. S. Geodetic Corps, to determine, geographically, the exact location of certain passes in the Aleutian islands and of other northern points in reference to Ounalaska and Kodiak island. They expect to be engaged in the work until July 1st, '96.

## Steal Inventions of Others.

As Thomas A. Edison watched the pumping of air from a glass tube in his laborrtory a day or two ago a man said to him:

"You patent every little thing you discover, don't you, Mr. Edison?"

"I do," said Mr. Edison. "And do you know why I do it?"

"I suppose you do it so you will reap the benefit of your discovery," was the reply.

"I thought you'd say that," said Mr. Edison, "and I don't suppose you will believe me when I tell you it isn't so. But it isn't so, nevertheless. I discover a great many things that I would be glad to give to the public for nothing, but I don't dare. I patent these things to save myself from defending lawsuits. There are a lot of sharks in this world who are continually on the lookout for new things, and when one of them hears of something new he bustles to the patent office to see if it is patented. If it isn't, he claims it as an original discovery and files his claim. Then he will turn right around and, like as not, begin suit against the very man who invented the thing for making or using it. The inventor will say: 'But I discovered this thing first; I am the inventor.' He is referred to the Patent Office, where he finds the official claim of original invention. The fact that the papers are filed long after he made his discovery does not help him, for all the other man does is to hire a fellow to swear that he made the discovery a month or two prior to the date the inventor claims. It sounds ridiculous, probably, but it is a fact, that there are often races between the inventors and these sharks to reach the Patent Office, the sharks having had early information about the inventor's discovery. There are many such races, and thousands of dollars depend on each one. What I say is literally true. I patent things, and no doubt many other inventors patent things just to save defending lawsuits."

"HISTORY OF CRIPPLE CREEK."

We have just issued in book form the only authentic and reliable history of Cripple Creek gold camp, the marvel of the mining world. The book contains numerous full-page illustrations of gold mines true to life. With the sole object of introducing our big 8-page 56-column illustrated weekly paper (established 1890) we will send a copy of the above interesting book free to all who send us 25c (stamps or silver), for a 3 months (13 weeks) trial subscription to our big weekly, which contains the latest mining news and illustrations of Rocky mountain scenery. Club of 5 and 5 books, $1. Mention THE PRESS and address, *Illustrated Weekly*, Denver, Colorado.

Cripple Creek Gold Stocks.

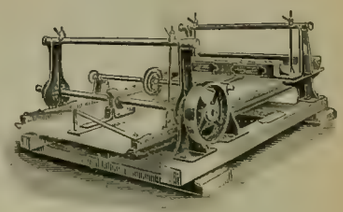
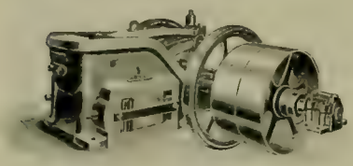
SONORA LAND AND MINING ABSTRACT BUREAU,

Sonora, Tuolumne Co., Cal.

Abstract of Titles to all lands in Tuolumne County made under the Durfee Self-Correcting and Adjusting System.



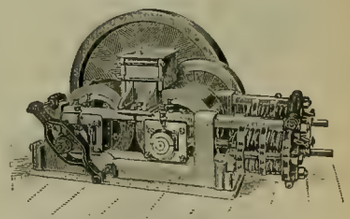
Mining properties for sale or bonded on desirable terms. Correspondence invited from principals desiring investments in quartz mining properties or in the development of promising claims. Reliable information given on all matters.



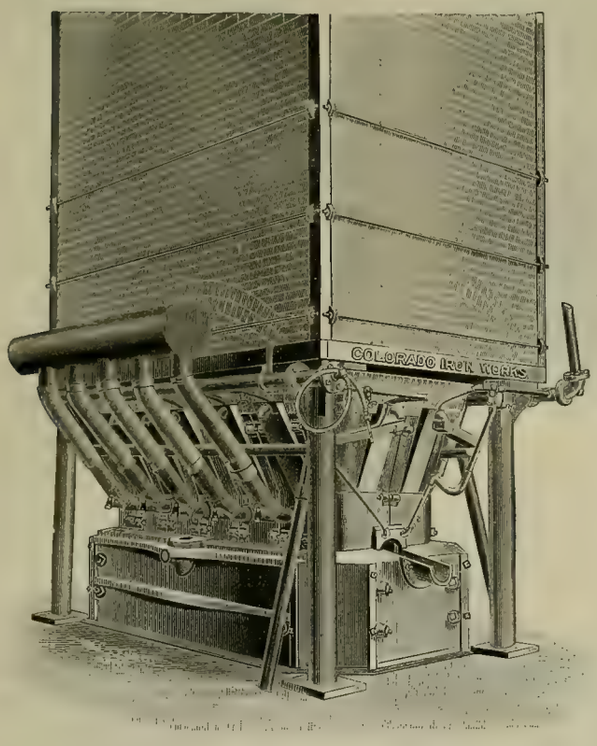
# THE COLORADO IRON WORKS CO.

## DENVER, COLORADO.

## Manufacturers of Mining, Milling and Smelting Machinery and Builders of Plants Complete.



No single machine so far introduced has proved so effective or so economical in first cost and cost of maintenance as the **PERFECTION CONCENTRATOR** (see cut), and none has the capacity for amount of work so effectively performed. It is light; is easy of access for accurate adjustment; has hard rolled copper plates which will not buckle from bumping. Capacity depends on character of ore but generally may be stated as twenty tons per day of twenty-four hours.



The best **ORE BREAKERS** made are the **BLACK HAWK** (or Dodge) and the **BLAKE.** We manufacture the Black Hawk (see cut) in four sizes, viz.: 6″x9″, 7″x11″, 11″x15″ and 16″x24″ jaw opening; the Blake in three sizes, viz.: 4″x10″, 7″x10″ and 9″x15″ jaw opening; and the **BOSWORTH,** for sampling and assay offices, in one size, viz.: 4″x6″ jaw opening.

We claim first place for our **CRUSHING ROLLS** and call especial attention to the following points: Solid Cast Frame, insuring rigidity; Rolled Steel Shells or Tires (no soft spots or holes); Universal Journal Boxes; End adjustment on Roll Shaft, to adjust rolls laterally, provides for even wearing of faces and consequently an even product is assured until shells are worn out. Look at cut opposite. Pamphlet on "Explaining Ore Crushing" mailed to interested parties on application.

CAZIN IMPROVED CRUSHING ROLLS.

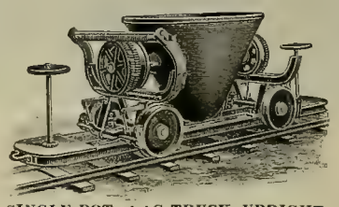
WATER JACKET SMELTING FURNACE.

Our Specialty is SMELTING FURNACES and Equipments for the reduction of

## Gold, Silver, Lead and Copper Ores,

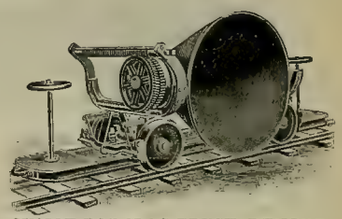
Having built many of the large plants in successful operation from Montana to Old Mexico. We show on the left a cut of our Standard Silver-Lead Furnace, and below some Slag Trucks for the quick handling and disposition of slag from smelters.

The following smelters are using these Slag Trucks:



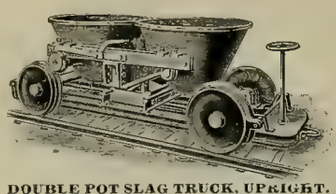
OMAHA & GRANT, GLOBE, Denver, Colo.

PHILADELPHIA, PUEBLO, Pueblo, Colo.

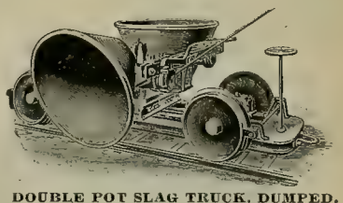


ARKANSAS VALLEY, Leadville, Colo.

UNITED VERDE COPPER SMELTER, Jerome, Ariz.



GREAT NATIONAL Monterey, Mex.



SINGLE POT SLAG TRUCK, UPRIGHT. Capacity, 35.16 Cubic Feet.

SINGLE POT SLAG TRUCK, DUMPED. Weight Empty, 6,350 Lbs.

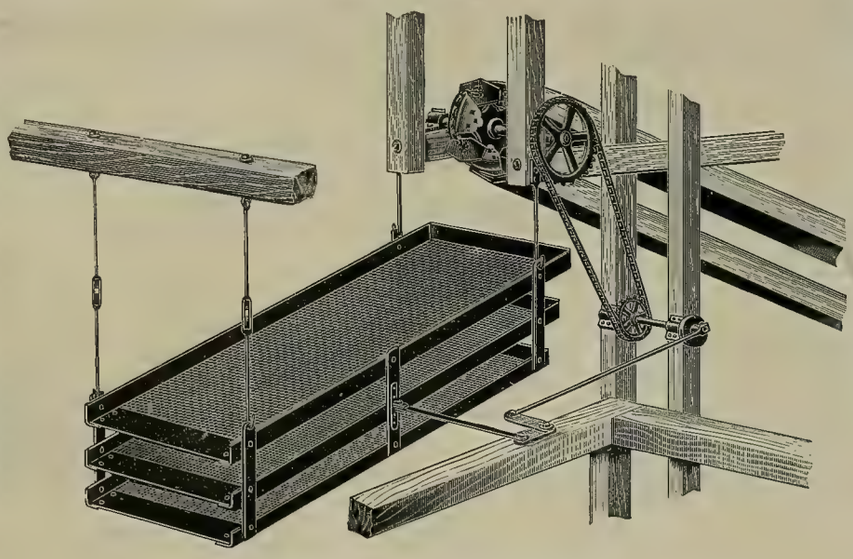
DOUBLE POT SLAG TRUCK, UPRIGHT. Capacity Both, 15.6 Cubic Feet.

DOUBLE POT SLAG TRUCK, DUMPED. Weight Empty, 5,900 Lbs.

WE CAN FURNISH ON SHORT NOTICE

**BOILERS and ENGINES, STEAM PUMPS,**

HEAVY CASTINGS AND FORGINGS.



EQUIPMENT FOR CONCENTRATION AND AMALGAMATION MILLING, and Cyanide, Chlorination and Bromine Processes.

CATALOGUES AND INFORMATION ON APPLICATION.

# Mechanical Progress.

### Harrison Conveyor Coal Screen.

Herewith is illustrated a Harrison coal screen, manufactured by Borden & Selleck Co., 48 Lake street, Chicago. The plan of operation is to raise the screenings high enough to be delivered on an inclined screen, which can be changed to any angle so as to have the coal run rapidly or slowly. It has a side shake motion, but can be changed so as to give it an end shake. It is made entirely of iron and steel, and where a capacity of about twenty-five tons of screenings per hour is to be separated the cost of the screen is about $100. The cost of the elevator is not included, as it varies with the height. The wires of the screens can be removed or replaced with new wires of coarser or finer meshes in a few minutes. The screen is also adapted for separating gravel, etc.

HARRISON CONVEYOR COAL SCREEN.

### Jeffrey Roller Chain Conveyor.

The illustration on this page shows a Jeffrey roller chain conveyor erected for the Allice Falls Co., Keesville, N. Y., by the Jeffrey Manufacturing Co., Columbus, Ohio. This conveys the pulp wood out of the water, and carries it to the storage ground, about 450 feet distant. The special feature of this conveyor is the roller chain, which enables it to operate smoothly, with little or no friction and wear, thus requiring little power. The chain has spurs or hooks at regular intervals, which carry the logs.

JEFFREY ROLLER CHAIN CONVEYOR.

---

"THE plan of winding steam pipes over eight inches in diameter with $\frac{3}{16}$-inch wire copper, thus nearly doubling the bursting pressure, is pronounced by competent judges to be an important change in engineering practice," says the *Railway Review*. "Further, that the thickness of sheet copper forming the pipe may be reduced to the minimum, and, at the same time, insuring the full advantage of wire winding, an improved system of manufacturing steam pipes has been devised, described as consisting in simply using copper of the thinnest possible gauge to form the interior or core of the pipe, while the body proper is composed of steel wire wound closely around the core, the interstices being filled in with copper by electro disposition. Increased strength comes from wire winding."

---

"STEALING THUNDER" has been objected to. On March 18th the New Jersey Legislature passed a law making the stealing of electric current from wires in that State punishable with fine and imprisonment.

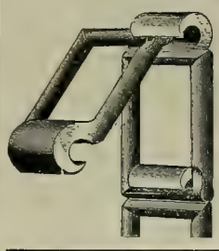
---

**Rapid Land Clearing.**

Large areas of forest land all over the western country are now lying idle and comparatively valueless, waiting to be cleared. Owners of such land can hardly fail to be interested in any practical mechanical device for doing this work of clearing effectually and cheaply. Such a machine has actually been in use on the Pacific Coast for eight or ten years, and has given excellent satisfaction in every instance. This machine is known as the "California Stump Puller"; it is the invention of the late Geo. Harvey, by whom it was introduced. The Cal. Stump Puller Co. is manufacturing it, at Zoe street. Write to the general manager, A. Barnes, for a catalogue that contains much valuable instruction about clearing land. See illustrated advertisement in another column of this issue. *

---

**Improved Side Shake Vanner Concentrator, Recently Built By Mr. Woodbury.**



After years of experience in building ore concentrators, Mr. Woodbury has gained sufficient knowledge to select and adopt all the best methods, hence the success that he has met with in improving and perfecting a side shake machine. He is now building these machines four, five and six feet wide in connection with his multiple belt and end shake machines. The Woodbury patent distributors are used on the side shake machines, giving a better distribution to the pulp on the belt. All these machines have first-class rubber belts and corrugated edges which prevent cracking. A six-foot vanner with improved distributor is capable of handling the pulp of five stamps. See cut in advertisement. *

# THE MacArthur-Forrest Cyanide Process.

## IT RENDERS LOW-GRADE ORES VALUABLE. 200 TONS OF CRIPPLE CREEK ORES TREATED DAILY.

## CAPACITY BEING DOUBLED.

One of the chief factors in the success of Cripple Creek has been the local facilities for profitably disposing of the low-grade ores that cannot stand railway freight and smelter charges. This has been made possible by the erection of two large cyanide plants — The Brodie Gold Reduction Co., 50 tons daily capacity, and The Metallic Extraction Co., 150 tons daily capacity. These plants are situated respectively at Mound City, El Paso Co., and Cyanide, Fremont Co. The Metallic Extraction Co. is at present doubling its capacity to more fully meet the supply of ore, and The Brodie Gold Reduction Co. also proposes installing new machinery. Although neither of these plants have been in operation for a year, they have already recovered over half a million dollars from low-grade ores that, but for the cheap treatment and high extraction by cyanide, must have remained valueless on the dumps. The accompanying engravings show the exterior of the Brodie Mill and also a part of the interior of the leaching department in that plant. This Process is at present in successful operation in over thirty mills operating on low-grade ore and tailings over all the Western mining States and Territories. The Gold and Silver Extraction Co. of America, Limited, with head offices in Denver, who control the patents for the United States, has for some time been suing the Mercur Gold Mining and Milling Co. of Salt Lake City, Utah, for infringement. This suit, which was regarded as a test case, was recently decided in favor of the patentees by a Decree entered in the Circuit Court of the State of Utah. A copy of this Decree is printed below. The Mercur Co., in accordance with this Decree, has now paid The Gold and Silver Extraction Co. *$20,000* for back royalties, and has taken out a License from them covering future use of the Cyanide Process at the Mercur Mill, on payment of regular monthly royalties hereafter. The Gold and Silver Extraction Co. are headquarters of all technical information and assistance for all who propose to adopt the Cyanide Process. At present, The Leadville Gold and Silver Extraction Co. is erecting a fifty-ton daily capacity Cyanide Plant at Leadville to handle the low-grade ores of the Leadville Gold Belt. The Company is composed of Ex-Governor J. B. Grant and Mr. W. H. James of the Omaha and Grant Smelters, Mr. August Meyer of the Kansas City Smelting Co., and Messrs. John Campion and Wm. Byrd Page of the famous Little Johnnie Mine, Leadville. Other plants are in course of erection elsewhere.

EXTERIOR OF THE BRODIE MILL.

PART OF LEACHING DEPARTMENT IN THE BRODIE MILL.

## THE PROCESS.

The Cyanide Process, as usually conducted, may be conveniently divided into three stages: First, the preparation of the ore. The ore has usually to be reduced to a fineness corresponding to 20 to 40-mesh per lineal inch, without producing an undue amount of dust, the desideratum being a pulp that, for the given mesh, will contain the minimum amount of dust. Such a pulp will be granular, and permit the free percolation of solutions through its mass. With properly designed machinery, working on ores of moderate hardness, it is possible to crush to 40-mesh without producing more than 10 per cent that will pass through a 200-mesh screen. The next step in the operation is to place the properly granulated pulp in open leaching tanks of capacities varying from 10 to 300 tons capacity or over. As it takes practically the same time to treat a charge of 10 tons as it does one of 300 tons, the economy and convenience of large charges is obvious. Weak solutions (0.4 to 0.6 per cent) of cyanide of potassium are allowed to percolate through the charge, say from three to five days, and, when the extraction of the precious metals is completed, water is added to replace the cyanide solution and the charge is then sluiced out, or, where water is scarce, it is shoveled out of the tanks. Finally, the cyanide solution which has percolated through the tank charged with crushed ore emerges carrying its burden of gold, and is next conducted to the precipitation boxes and caused to percolate slowly through zinc shavings. There the gold is deposited as a dark brown, or dark yellow, powder, which is cleaned up periodically, freed from zinc and smelted, the resulting bullion usually being disposed of at the local mint. The cyanide solution, freed from gold by passing through the zinc boxes, is returned to the leaching tanks to dissolve more gold, and is thus kept in continuous circulation, though, of course, fresh cyanide is added from time to time to keep the strength of the solution normal. The Gold and Silver Extraction Co. of America, Limited, was awarded the leading Process Medal at the World's Columbian Exposition.

**Official Decree in the Mercur Cyanide Case.**

**The following is the full text of the Decree of the United States Circuit Court for the District of Utah in the case of The Gold and Silver Extraction Company of America, Limited, vs. The Mercur Gold Mining and Milling Company, John Dern and Henry W. Brown, as entered by Hon. John A. Marshall, Judge of the District:**

**United States of America,** } ss.
**DISTRICT OF UTAH,**

*In the Circuit Court of the United States in and for the District of Utah aforesaid.*

**Present: HON. JOHN A. MARSHALL, Judge of said Judicial District.**

THE GOLD AND SILVER EXTRACTION COMPANY OF AMERICA, LIMITED, *Plaintiff.*

*VS.*

THE MERCUR GOLD MINING AND MILLING COMPANY, JOHN DERN AND HENRY W. BROWN, *Defendants.*

**DECREE.**

The summons and complaint in this action having been duly personally served on all the defendants above named, upon the said The Mercur Gold Mining and Milling Company and John Dern on the 12th day of January, 1895, and upon the above named Henry W. Brown on the 14th day of January, 1895, and the defendants having all duly appeared in said action and filed a demurrer to said complaint on the 11th day of February, 1895, and the plaintiff having by leave of the court filed an amended complaint on the 5th day of April, 1895, and a second amended complaint by leave of the court on the 9th day of July, 1895, and a third amended complaint by leave of the court on the 16th of March, 1896.

**Now**, on reading and filing the annexed consent of the attorneys for all the respective parties, and on motion of Messrs. Marshall & Royle, Bennett, Harkness & Bradley and Williams, Van Cott & Sutherland, Hugh Butler and Walter D. Edmonds, attorneys, or of counsel for the plaintiff, it is hereby

**Ordered, Adjudged and Decreed** that letters patent of the *United States, Number 403,202*, issued to John Stewart MacArthur, Robert W. Forrest and William Forrest, on the 14th day of May, 1889, for improvements in process of obtaining gold and silver from ores, and the claim of said letters patent are good and valid in law, and that the plaintiff herein is entitled to the exclusive rights in and to and under the said letters patent, and in and to the inventions secured thereby, and that the entire title to said letters patent is duly vested in the plaintiff.

**It is Further Ordered, Adjudged and Decreed** that letters patent of the *United States, Number 418,138*, issued to John Stewart MacArthur on the 24th day of December, 1889, for improvements in metallurgical filter, and each and every claim thereof are good and valid in law, and that the plaintiff herein is entitled to the exclusive rights in, to and under the said letters patent, and in and to the inventions secured thereby, and that the entire title to said letters patent is duly vested in the plaintiff.

**It is Further Ordered, Adjudged and Decreed** that the defendants have jointly and severally infringed upon the said several letters patent upon each and every claim of each thereof, and upon the exclusive rights of the plaintiff thereunder, by using in the treatment of ores in their mines and mills the improvements in the process of obtaining gold and silver from ores, which are described and claimed in said letters patent Number 403,202, and also conjointly said patented improvements in metallurgical filters, which are described and claimed in the claims of said letters patent Number 418,138, by using substantial processes of separating precious metal from ore con-substantially in subjecting the powdered ore to the action of a cyanide solution, containing cyanogen substantially in the proportion not exceeding eight parts of cyanogen to one thousand parts of water, as described and claimed in said letters patent Number 403,202, and also conjointly with the use of said process; further using metallurgical filters containing the improvements and inventions described in said letters patent Number 418,138, and as claimed in the claims thereof.

**And**, an accounting being waived,

**It is Hereby Further Ordered, Adjudged and Decreed** that the complainant do recover of the defefendant, The Mercur Gold Mining and Milling Company, the sum of Twenty Thousand Dollars in full of all the gains, profits, savings and advantages which the said defendant, The Mercur Gold Mining and Milling Company, has derived, received or made, by reason of the infringement of the plaintiff's exclusive rights under the said letters patent aforesaid, or either of them, and also any and all damages which the said plaintiff has sustained by reason of such infringement of its exclusive rights by the said The Mercur Gold Mining and Milling Company.

**And it is Further Ordered, Adjudged and Decreed** that the defendants, The Mercur Gold Mining and Milling Company, John Dern and Henry W. Brown, and each of them, their and each of their servants, agents, attorneys and workmen be, and they hereby are, severally enjoined and restrained from directly and indirectly using or causing to be used any process or improvements like or similar to those which the the said defendants or either of them have heretofore used which may in any wise infringe either of the patents hereinafter named, in the treatment of ores in their said mines and mills, in the process of obtaining gold and silver from ores, or containing or embodying the inventions, improvements and process or either of them, or any part of them described and claimed in said letters patent Number 403,202 or any substantial or material parts thereof as claimed in the claim of said letters patent, and from imitating or using the said inventions, improvements or process, or either of them, or any part or parts thereof in any way whatever during the term of said letters patent Number 403,202.

**It is Further Ordered, Adjudged and Decreed** that the defendants, The Mercur Gold Mining and Milling Company, John Dern and Henry W. Brown, and each of them, their and each of their servants, agents, attorneys and workmen be, and they hereby are, severally enjoined and restrained from directly or indirectly using or causing to be used any metallurgical filter like or similar to those which the said defendants, or either of them have heretofore used, which may in any wise infringe either of the patents herein named, or containing or embodying the inventions, improvements or mechanism or any part thereof, described in the claims of said letters patent Number 418,138, or substantial and material parts thereof as claimed in the claims of said letters patent, and from imitating or using the said inventions, improvements or mechanisms, or any part or parts thereof, in any way whatsoever during the term of said last named mentioned letters patent.

By the Court,

JOHN A. MARSHALL, District Judge.

**We Consent** to the form of the foregoing decree and to the entry thereof.

THOMAS MARSHALL, JONATHAN C. ROYLE, P. L. WILLIAMS, WALDEMAR VAN COTT, C. W. BENNETT, WM. M. BRADLEY, *Solicitors for Plaintiff.*

(Signed) HUGH BUTLER, *of Counsel.*

W. H. DICKSON, FRANK PIERCE, *of Counsel for Defendants.*

FRANK PIERCE, *Solicitor for Defendant.*

# Electrical Progress.

MANY electric power stations are greatly exercised over the fact that not a few of the business houses and manufacturing places in their immediate vicinity obtain their electricity for light and power purposes without paying for it. The free discussion of the way in which the pipes running under many city streets have been honeycombed and destroyed by the electrolytic action of the stray currents from trolley lines has taught the public that where electric roads are operated there is plenty of current, as it were, lying loose, and the next idea that naturally presents itself is to turn it to account. Any electrician can, for a few dollars, make the required connection, and the electric companies have no case against the man who does it. It is not like tapping a gas main, for the electricity is taken from the ground, and not from the company's wires. All along the line of electric roads in large cities are numberless pipes, which, being good conductors, are sought by the stray electricity. Water pipes are particularly susceptible, as water itself is a good conductor. To utilize the current it is only necessary to attach wires to a motor, and a very efficient power is obtained without expense. It is also said that a great deal of private lighting is never paid for, and owes its existence to this deflected electricity.—Scientific American.

THE cathodic rays literature is overwhelming, and comprises more that is sensational than scientific. Among minor matters is considered worthy of note the discovery and publication by Dr. W. J. Morton of a new method of producing cathodic rays in vacuum tubes by means of a static machine and Leyden jars. The cathodographs taken by this process are of unusual strength and cleanness. This is a new proposition in Roentgen photography. The historical fact that Dr. Morton made a demonstration of the production of etheric light by means of the static machine and the same bulb he is now using for producing Roentgen rays, in 1893, before the American Institute of Electrical Engineers, now thus acquires additional interest and importance. Another valuable new departure is reported from Toronto, where Professors McClellan and Wright have discovered a method of taking instantaneous photography by cathodic rays. Hitherto it has been found impossible to focus the rays, which radiated in all directions with varying intensity. By covering the Crookes tube with a glass jar, the rays are directed downward, there flection obtained practically focusing the rays and giving an instantaneous photograph.

ELECTRIC welding progresses. Welding of metals by the electric current was but recently looked upon as a pretty laboratory experiment, but its commercial value is now being recognized. The real advantage of the system is not so much its economy as that it is a method of securing an absolutely reliable result. On straight welds it is estimated that it will cost between 10 and 15 per cent more than the ordinary smith's work, but, on the other hand, out of 500 set trials there has not been a single failure or even a defective weld. The metal, when put under excessive strain, will also break at a point other than the welding junction. One firm which uses the system for piercing shafts from three-eighths of an inch to two and one-half inches in diameter, and for heating necks and bearings for hardening purposes, says that it can get through at least two-thirds more work for each machine than a smith and striker, at a less cost, and with scarcely any waste of iron.

THE possibility of telegraphing through space, which was apparently demonstrated last year by W. H. Preece, has been turned to account in a most effective way for maintaining communication between the mainland and the Fastnet lighthouse, on the southwest coast of Ireland. Formerly the difficulties of carrying a telegraph cable up an exposed rock, where it was subject to constant chafing, were almost insuperable. The non-continuous system is now used, and works admirably. The cable terminates in the water, sixty yards off, and the electric currents sent from the shore find their way through this distance to two bare wires that dip into the sea from the rock. The same system could find practical trial at Tillamook Rock lighthouse, about twenty miles from the mouth of the Columbia river, off the Oregon coast, where for ten years sporadic efforts have been made to secure continuous telegraphic communication with the mainland, the violent seas that eternally sweep the basalt base of the island lighthouse precluding all possibility of cable connection.

A NEW use of the trolley roads is being thought out by railroad men and has already been put into practice in certain parts of the Central Traffic Association territory. A trolley line, for instance, which runs out into country districts from large cities and villages is having its cars so built as to haul one or more freight cars to certain points away from the steam railroad lines. These cars carried in this way farther into the interior are permitted to lie at certain points to receive grain from farmers' deliveries by wagon, or run on sidings alongside warehouses which are open to receive the produce of the farmer. In this way it is calculated that the farmers will be stimulated to use the lines more to carry freight into market and save expense of hauling it themselves. It is almost a new development in the use of the trolley, and railroad men predict that it may revolutionize the present system of railroading in some respects. It is even suggested that it may become necessary for large railroading companies to equip their own branch lines with a trolley system so as to cater to a new class of business in this direction.

TELEGRAPHY is now passing, like so many other industries, from the stage of hand operation to that by machine. Hand telegraphy has continued to be practiced with wonderful tenacity. Even now, probably 90 per cent of the telegraph business of the world is done by hand. In America and England it is by hand and sound. In all other countries it is effected by hand and sight, although Belgium is just beginning to use the sounder. France, Germany, Italy, Austria, Spain, Russia and in fact the rest of the world use the Morse key and a receiving instrument which records the dots and dashes in ink on a paper tape. In the new system a marvelous stride is taken in telegraphic transmission. A message is put on a continuous tape and placed in a transmitter. At the touch of a key the tape rushes under the "brushes" of the transmitter, and the message is printed on a tape at the other end of the line. Mr. Delany, the inventor, claims for the system a working speed of 800 words a minute, and has sent over 3000 words, or nearly two ordinary newspaper columns in one minute.

THE American Electric Heating Corporation, after six months of negotiation, has absorbed all the important electric heating companies and the control of the new consolidation has passed into the hands of a syndicate. The concerns absorbed by the American Co. are the Western Electric Heating Co. of St. Paul, the General Central Electric Heating Co. of New York, the New England Heating Co., the Burton Electric Heating Co. of Richmond, the Carpenter Electric Heating Co. of St. Paul, the Dewey Electric Heating Co. of Syracuse, the Richelieu Electric Heating Co., as well as several others which have not been active in the business for some time, but which owned valuable patents. The manufacturing will be concentrated at Cambridgeport, Mass. J. I. Ayer, president of the National Electric Light Association, is the general manager. The capital stock is $10,000,000, and an issue will be made of $500,000 bonds. The bonds will be cumulative after January 1st, 1898, to have a sinking fund of $10,000 per annum.

NICOLA TESLA is credited with a statement last week that he was satisfied he had a machine, which, when perfected, would enable him to make practical experiments in distributing electric waves about the earth so that messages might be conducted to all parts of the globe simultaneously. He believed that electric waves might be propagated through the atmosphere and even the ether beyond, a disturbance of the waves at any point being instantly felt at every point along them. He declared that he believed that the transmission of news about the earth by electric waves in the place of wires was no longer a dream.

JAMESTOWN, SOUTH DAKOTA, to January 1st, has paid $8 per month for its electric lights burning to midnight. The citizens thought that rate excessive, and all the lights have been turned off. Jamestown has a supply of water from a 3½-inch artesian well, which is used for fire protection and the furnishing of power to about twenty water motors in the city. As this power is all taken up, the municipal authorities are considering the sinking of a six-inch well to furnish power to run an electric-light plant. They have decided that this is the cheapest and most profitable remedy available.

TELEPHONIC COMPETITION in this city has led to one company offering to put in telephones in kitchens of private residences for fifty cents per month. Another company will put in a telephone having connection with the general exchange for $2.50 a month and five cents a switch. In Los Angeles a company offers similar service for $2.50 and $3.50 per month.

AT Ogden, Utah, the Pioneer Electric Power Co. has let a contract for making six miles of wooden piping, which will bring the water of Ogden river from the dam to the power house at the mouth of the canyon, to Chris Darff of Ogden for $50,000.

THE Mercur, Utah, Electric Light and Power Co. will turn on its currents May 1st, with a capacity for supplying 1000 lights. The dynamos will be located in Ophir canyon, from which the light and power will be transmitted a distance of six miles.

THE Park City, Utah, Electric Co. has incorporated; capital stock, $300,000. Jas. Moffatt of Salt Lake is treasurer and secretary. The idea is to generate electrical power in Cottonwood canyon and transmit it for light and power purposes to Park City.

THE Bend Power Co., Mariposa Co., Cal., which proposes to install an electrical power plant, is asking mine owners and others likely to use power or light from them to state their requirements so that adequate machinery may be put it.

### A Daring Conception.

Preparations are under way for the creation in Cincinnati of a stupendous engineering novelty. It is intended to carry passengers from Sedamsville, directly over the Ohio river, to Lagoon Park, and the startling feature of the scheme is that the transport cars are to be lifted 120 feet in the air and then swung across the river by the overhead pulleys. Extraordinary as the scheme may seem, it is one which is in common and successful use—though not now as a means of passenger traffic—and the plans and specifications for the proposed structure are in the hands of the contractors. The scheme was devised as the result of investigations made last summer, with a view to arranging some practical method of direct communication between the western part of Cincinnati and the Kentucky pleasure resort. Briefly, the plan is as follows: Two steel towers, each 152 feet high and 50 feet square at the base, are to be erected, one on the river bank in Sedamsville, and the other 1760 feet distant, on the edge of the Lagoon grounds, in Bromley. The towers are to be connected with four patent steel carrying cables of 50 tons tensile strength. Beneath each tower there is to be a waiting room, and at the side of each tower will be the landing, to which the car descends. The hoisting and propelling machinery, weighing 60 tons, will be located in the tower, 60 feet above the ground. The span of the cables will extend 1760 feet, being 150 feet from the ground at the ends, and having a sag at the center of from 60 to 90 feet, according to the load suspended to them. The car will weigh 10 tons empty, and will carry 50 people. When the car is loaded it will be hoisted vertically from the landing until, by a series of automatic clutches, it is suspended to the pulleys on the four carrying cables. It will then be propelled by a system of tug cables and pulleys across to the opposite tower, traveling at the rate of 1200 feet a minute. At the opposite end it will be lowered to a landing, and the passengers will disembark, either in the Lagoon grounds or Sedamsville, as the case may be. Some idea of the immensity of the undertaking may be gained when it is known that the towers will be higher than any building in Cincinnati, and that the whole plan involves an outlay of over $1,000,000. It will require two miles of two-inch cable and eight miles of running cable. The plans have been sent to the Secretary of War for his inspection, as his permission is required for the erection of any structure crossing a navigable river.

THE KINKEAD MILL.

The Latest and Best.

CAPACITY.....10 to 15 tons.
POWER REQUIRED.....only 2-horse.
TOTAL WEIGHT.....only 2½ tons.
TOTAL COST F. O. B.....only $1000

This includes Automatic Self Feeder, Mill, Silver Plates, Mill Frame Timbers, Foundation Timbers, etc.

NO NOISE—NO VIBRATION—NO JAR.

More than double screen surface with one-quarter power and less than one-half wear and tear of ordinary Stamp Battery. **Can be set up in 24 hours.**

# GILLETT, El Paso Co., Colo.

## THE GREAT SMELTER AND REDUCTION CENTER OF THE

# CRIPPLE CREEK MINING REGION.

### Three Immense Plants Being Erected and Others Arranged For.

**GILLETT** will be to the Cripple Creek country what Anaconda, Montana, is to Butte City—the Great Industrial Center of Activity where the millions of tons of ores from the Cripple Creek and adjoining sections will be treated by the new processes which are now operated there and under construction for that purpose. IT IS AN IDEAL TOWNSITE LOCATION, Level and Sightly, and has the great advantages of Abundant Fuel and Water. IT CONTROLS THE WHOLE WATER SUPPLY of the surrounding mining sections and is the Head Source of Water Supply for the adjacent mining camps. A large number of the richest mines of the Cripple Creek district border the townsite, many of which are now nearly sufficiently advanced in development to commence the shipment of ore. The veins are large, well defined, and give sure promise of immense future returns in the precious yellow metal. The outlay of hundreds of thousands of dollars in the already existing and contracted for reduction plants, and the certainty of the location of others there in the near future, assures GILLETT of a permanent and rapid growth; and it is confidently predicted that very shortly GILLETT will be the GREAT CENTER OF BUSINESS AND INDUSTRY and the Most Populous City of the Cripple Creek District. Stores, hotels, banks, business houses, etc., are being erected as rapidly as lumber and brick can be procured, and the activity of the knowing ones to be in the front rank of advance in this commercial center almost borders on a boom. The heavy financial backing and permanency of the big establishments which are under construction at GILLETT, however, precludes any idea of mushroom growth. Everything is going forward on carefully laid business plans, with the idea of sufficient capacity for taking care of the present and future immense output of the Cripple Creek section. On these lines GILLETT'S INDUSTRIES are being erected, and as to the growth of the town, that will take care of itself. It needs no boomers to insure that rapidity which characterizes the growth of a locality so situate that the business of a rich mining section must of necessity be carried on within its limits.

With the idea of accommodating business men with ground on which to build and carry on trade and traffic, and for the building of homes for the thousands of mechanics, miners and laborers to be employed in the great smelters and reduction works operated at GILLETT, the Company has platted a part of its land and is now selling off lots at VERY LOW PRICES on the following terms: ONE-HALF CASH ON DAY OF PURCHASE, when the purchaser will receive the Company's regular form of contract for a deed, to be executed upon payment of the balance due, provided such payment is made within SIXTY DAYS FROM DATE OF PURCHASE. If the entire purchase price is paid in CASH, a deed will be executed AT ONCE. TITLE ABSOLUTELY PERFECT. Address,

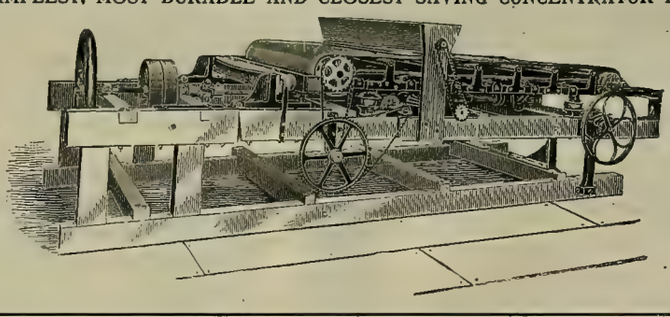
# The McGlew Ore Concentrator Company.

PATENTED SEPTEMBER 19, 1893. CHEAPEST, SIMPLEST, MOST DURABLE AND CLOSEST SAVING CONCENTRATOR IN USE. FRANK BARRERE, Secretary and Manager.

Can be seen in operation at the Company's works, 132 Main Street, San Francisco.

Office, 116 Davis Street.



NINETY-FOUR AND ONE-HALF PER CENT —SAVED— ON ORES DIFFICULT TO CONCENTRATE.

A MARVEL of Simplicity, Durability and Effectiveness combining both Side and End Motion with a Bumping Belt.

SPEED AND INCLINE of belt and amount of PERCUSSION easily and quickly regulated, WHILST IN OPERATION

CAPACITY about ten tons. Only one-tenth horse power required. Adapted for either canvas or rubber belts.

PRICE.....$350 EACH
Including prepared canvas belt 4 ft. 6 ins. wide.

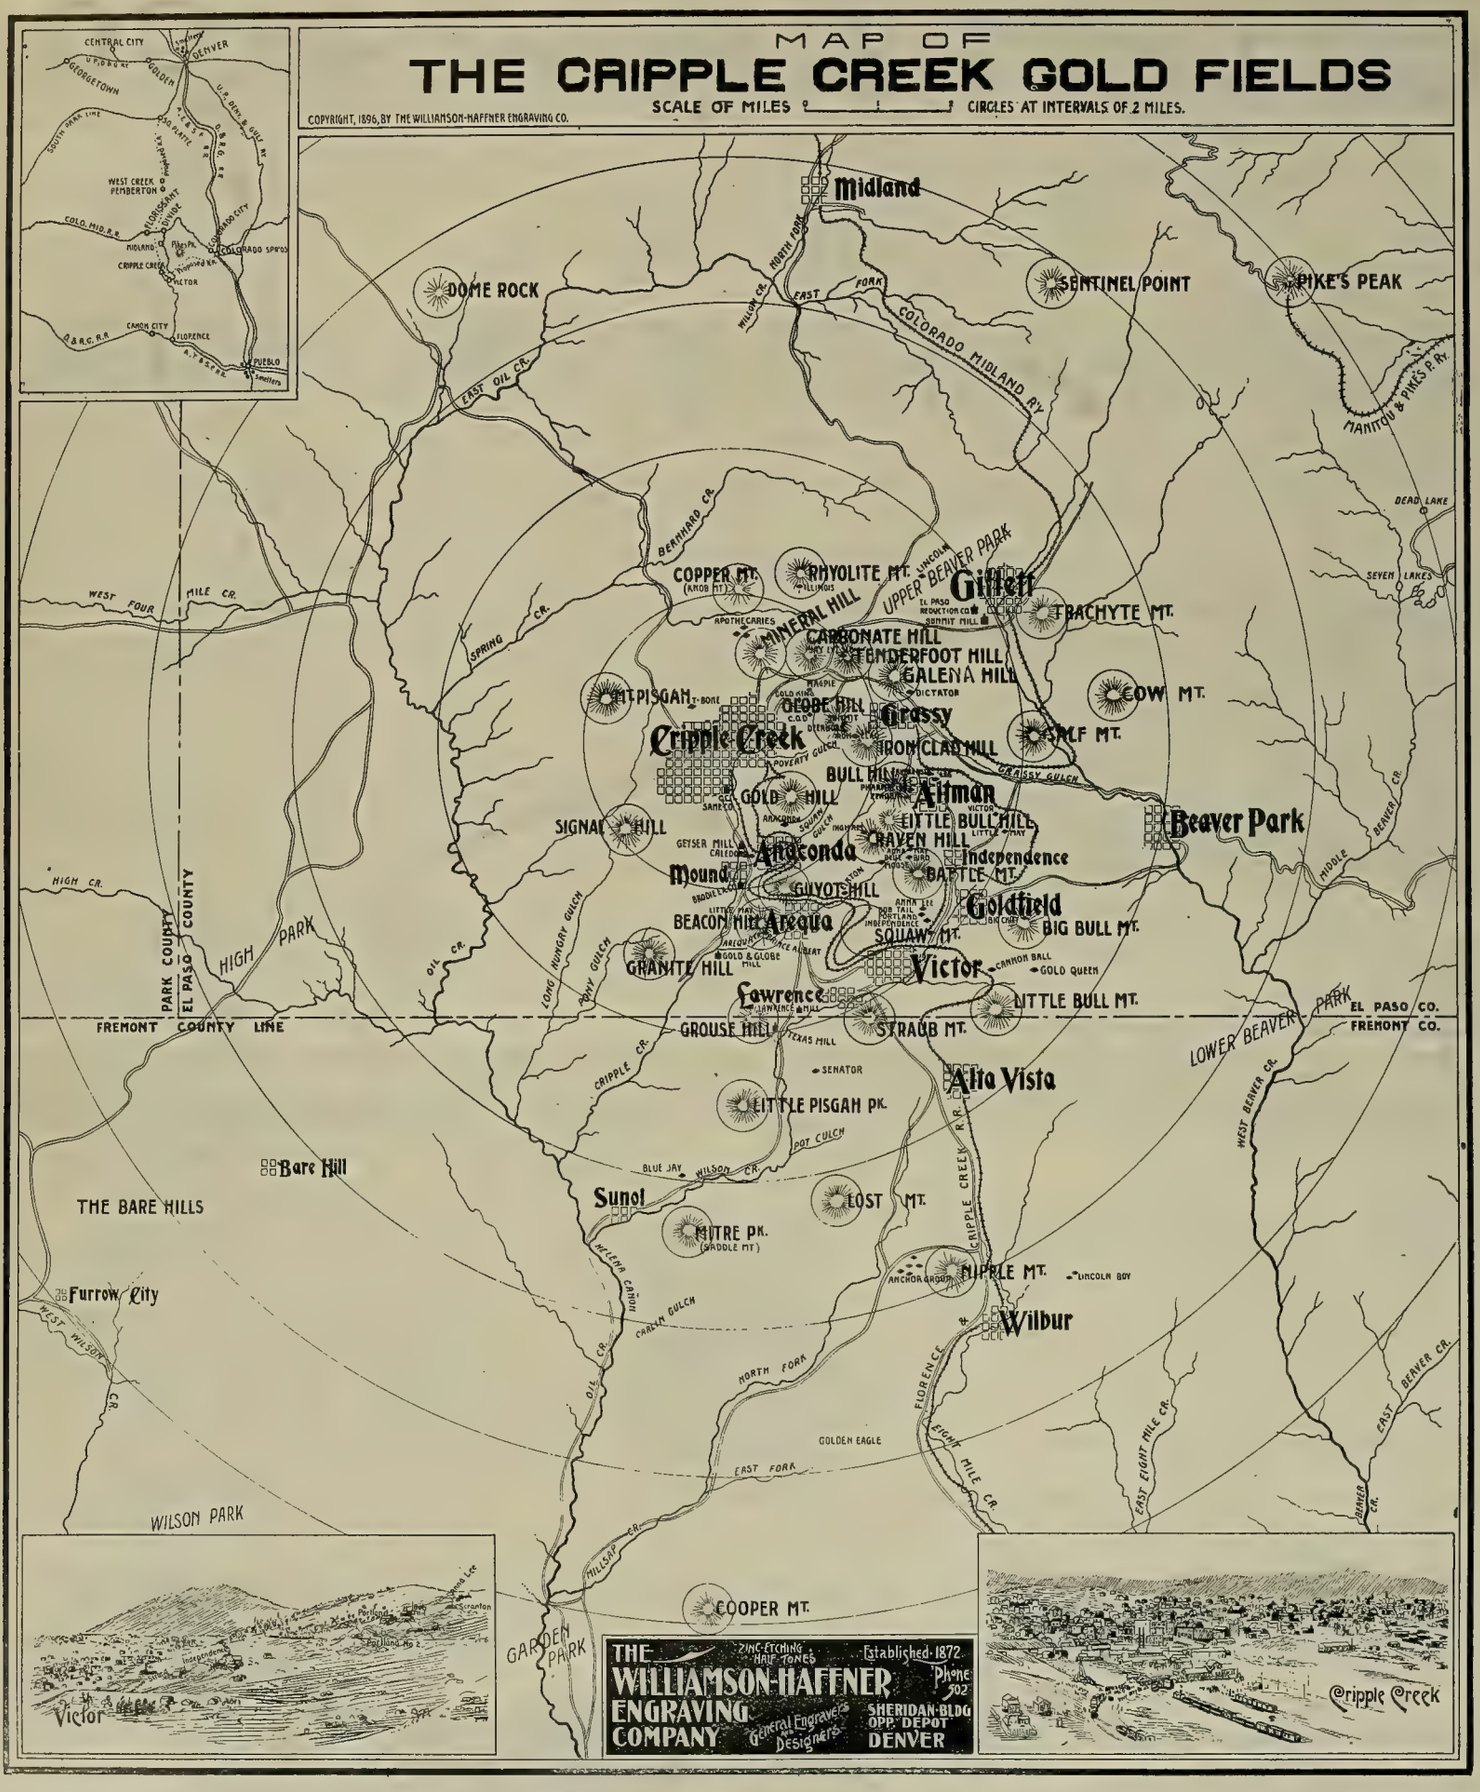
FALLS MINE, IGO, SHASTA CO., CAL., May 25th, 1893.

THE MCGLEW CONCENTRATOR COMPANY:—I take much pleasure in endorsing your very superior Ore Concentrator. When I was requested to examine your concentrator, I did so under protest, declaring that I would have none other than a Frue, as after many years' experience with different concentrators, I believed them to be the best.

Now, after a thorough trial of the McGlew Ore Concentrator, on ores difficult of concentration, I emphatically pronounce it the best concentrator of any I have ever used in handling my ores. It is doing CLEANER and CLOSER work than I had believed possible for any concentrator to accomplish.

Samples of pulp and tailings, taken every hour, dried, mixed and assayed, show * * * from West ledge, a saving by your concentrator of 94½ per cent; from East ledge, * * * a saving of 92 per cent. The concentrator runs very easy and requires but slight attention. One man attends to rock breaker, crusher and concentrator

You have a good concentrator, and it can be relied upon to handle any ore that will concentrate. I most heartily recommend it to the mining public. Yours respectfully,



E. L. BALLOU, Propr. Ballou Reduction Works.

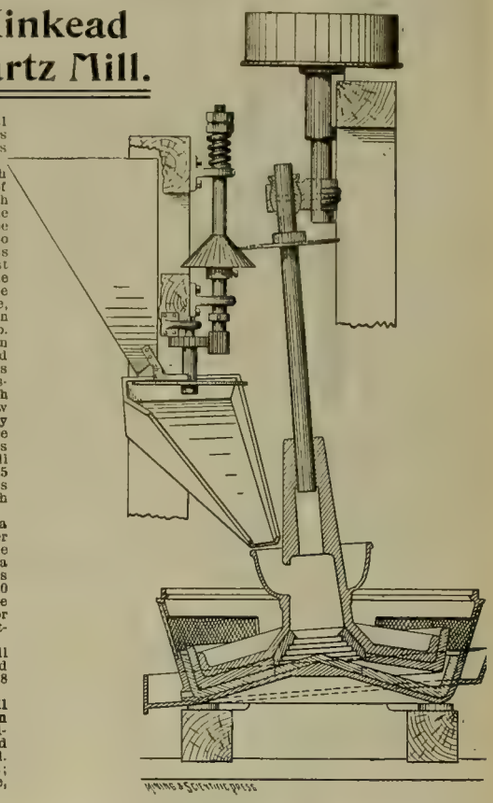
## THE DANIEL BEST CRUDE OIL ENGINE.

CAPACITY 2 to 200 HORSE POWER.

**The Cheapest Power Known—Invaluable Where Fuel Is Scarce.**

The most economical motive power ever invented, costing but 10 cents per H. P. per ten hours run, using crude oil. Cheap, safe, reliable and clean. Strong and simple to operate. Requires no engineer, and when you stop, all expenses cease, and no fire is left to endanger your building. Send for Illustrated Catalogue with full particulars, and mention the MINING AND SCIENTIFIC PRESS.

—Also Agents for—



## The Kinkead Quartz Mill.

This sectional drawing shows the main features of **The Kinkead Quartz Mill** which will do the work of five stamps with less than half the power, and can be built and put into operation for less than half the cost of stamps. The only wear is the shoe and die, which is less than that of one stamp. The cheapness in first cost and operation of this mill makes it possible to work with profit ores so low in value that they have heretofore been treated as waste. Each mill will crush 15 tons in 24 hours through a 40-mesh screen.

It requires a two-horse power Daniel Best Crude Oil Engine, at a cost of 10 cents per H. P. per 10 hours' run. There is no vibration or jar, and very little noise.

Engine and Mill can be set up and running in 48 hours.

**Price of Mill $1,000, f. o. b. San Francisco.** Feeders, Apron and Plates included. Weight, 2½ tons; heaviest piece, 1200 pounds.

# Mining Summary.

THE River and Harbor bill passed the House of Representatives on the 6th. An important provision in the bill is the following appropriation:

"For the construction of restraining barriers for the protection of the Sacramento and Feather rivers in California, $250,000; such restraining barriers to be constructed under the direction of the Secretary of War in accordance with the recommendations of the California Debris Commission, for the purposes set forth in sections 23, 24 and 25 of the act entitled 'An act to create the California Debris Commission and regulate hydraulic mining in the State of California, approved March 7, 1893,' provided said sum shall be available only on condition that the Legislature of the State of California shall have appropriated at least an equal sum for purposes herein set forth, to be expended in accordance with recommendations of engineers of the United States Government."

It is believed the bill will pass the Senate substantially as above and with the $250,000 already appropriated by the State will make $500,000 almost immediately available for the purposes specified.

### Amador.

The debris commissioners have granted permission for hydraulic operations at the Lowry gravel claim at Aqueduct.

The Median shaft is down 500 feet; crosscutting goes on from the 900-foot level of the Tallisman shaft east to the Median. The South Spring Hill shaft is being pumped out; 1200 feet of new cable has been put in, and 700 feet at the Median.

Superintendent Martin is cleaning out the shaft of the old Kling mine, on the northern boundary line of the Keystone. He intends to extend the depth several hundred feet.

At the Treadwell mine the tunnel is in 475 feet.

### Butte.

The Spring Valley Gold Mining Company, Cherokee, has filed notice that it will move for a new trial.

AT ENTERPRISE—P. Kloss has sold the Red Point mine to San Francisco men who will put up a mill.

Mr. Peters at Rocky River mine is taking out nuggets, some of which are worth $75.

At the Carlisle mine, on the south fork of Feather river, work is vigorously pushed by fifteen men. A tunnel is being run, a shaft sunk and an upraise driven.

Judge Prewett has filed the findings and judgment in the case of Alvord et al vs. Spring Valley Hydraulic Gold Co. A decree of foreclosure is ordered for $282,000 in favor of the bondholders, fixing the attorney's fee for the plaintiff at $10,000 and the compensation for the trustees, Alvord et al, at the same rate as provided by law for executors, which will amount to nearly $6000. The decree includes all the property of the company, including lands, ditches, water rights, etc., with the exception of the Waldeyer and Rideout, Smith & Co.'s lands. The decree also provides that the receiver's expenses be first paid, the attorney's fees second, trustees' compensation third and then the bondholders.

### Calaveras.

Active operations have been resumed at the Green Mountain mime, Chili Gulch, under the superintendency of John McSorley. The chlorination works at the Esperanza mine were started up last week, handling six tons daily.

Prince Poniatowski has bonded from C. R. Lloyd the Specimen group of mines, one mile from Fourth Crossing, on a two-year bond for $22,000. Work is to be commenced in thirty days.

Mr. C. R. Lloyd has also bonded fifty-five acres of his 110-acre gravel mining ground on Central Hill, to I. Copeland of Vallecito.

A new shaft is being sunk on the Martin mine near Sheep Ranch.

The Ford Gold Mining Co. has issued a call for the first payment of 7½ cents per share to be made on the stock. Payment is to be made on or before April 20th.

Maloney & Hardy of Hawkeye have been paid $3000, the balance due on their Hawkeye mining property, bonded to the company represented by Philip Deidisheimer.

*Prospect:* The Starlight mine, bonded two months ago to G. McG. Ross, formerly superintendent of the Union mine at Copperopolis, is being vigorously developed. Day and night shifts are at work.

### El Dorado.

(Special Correspondence).—The Boulder mine, situated in the Jay Hawk district, fifteen miles southwest of here, is displaying great activity in development work. The incline has reached 550 feet on a 5-foot ledge. The property is owned by the Williams Bros. of San Francisco.

Parties from Santa Cruz have begun work on the old Baltic mine, twenty-five miles east of Placerville.

M. L. Requa of San Francisco is prospecting on the old Eureka property, near Grizzly Flat.

The Blue Bank mine has been bonded by the Murphy Bros. to J. J. Antwerp of Cripple Creek. The old tunnels have been reopened and tracked. The shaft will be cleaned and deepened. A 2-stamp prospecting mill is running day and night. The ore is free milling and nets from $10 upward. This is situated on Weber creek, fifteen miles southeast of Placerville. Kanakas operated this property with three arrastras. It is a promising mine.

A new shaft is being sunk on the Adams Gulch, which years ago yielded high grade ore, but was abandoned at water level. C. J. Heald, the owner, will push the work rapidly. This is thirteen miles west, near Nashville.

The Lone Star, five miles south of town, is being developed by D. H. Jackson and San Francisco people. The tunnel has reached 150 feet on the ledge. The ore is of dark ribbon rock formation, free milling.

Suman & Anderson are developing a claim near Irish creek, in the Garden Valley district, with fair prospects for a mine.

Richard Woolcock, the veteran prospector, is developing a hopeful looking ledge beyond Kelsey, near Garden Valley.

Considerable prospecting for quartz is going on in the neighborhood of Rescue, in the Weber creek region, fifteen miles southwest. The green slopes of the mountain sides are everywhere being plateaued with ore dumps and tunnel openings.

Placerville, April 7th.

At Garden Valley the California Jack mill is in operation. There are ten stamps of 1000 pounds each.

### Kern.

At Randsburg water must be hauled ten miles and costs $2 a barrel. About 200 miners are in the district, which is 75 miles from Tehachapi, at an elevation of nearly 5,000 feet. A townsite is to be staked off.

Mooers, Singleton & Burcham crushed five tons of ore, which yielded $900. They have nine mines. The Olympus, with a 30-foot ledge, averages over $90 per ton.

There is a quartz mill at Cowell's and another will soon be erected.

### Lassen.

The Bieber *Gazette* declares that "Willis Howard struck the richest vein of ore in the Blue Bell mine on Hayden Hill last week that was ever discovered on the Hill. It is only one inch wide, but it goes $100 to the pound—almost pure gold."

### Madera.

At Grub Gulch the Gambetta mine employs twenty-five men. The 400-foot level, east extension, is now the largest and richest part of the mine.

The Savannah mine, owned by Mr. Sharp of San Francisco, consists of four full claims and has ten stamps running and two hoists.

The Starlight mines, three claims, on the westerly extension of the Savannah mines, are owned by C. M. Ward and M. M. Gale of San Francisco. The inclined shaft is sunk on the ledge 340 feet. The ore samples $6 per ton in free gold. The ledge is from 5 to 8 feet wide of solid ore. There is 1600 tons of ore now on the dump. The owners have not yet put up a mill, but expect to soon.

### Mariposa.

*Gazette:* In the Whitlocks district prospectors and miners are out in all directions. There is a probability of the Triumph mine being sold within the next few days.

At the Mabel & Ethel mine, owned by Dr. E. S. O'Brien of Merced and others, development work is going on steadily, but somewhat slowly on account of the character of the country.

Coulterville *Miner:* The Merced Gold Mining Company's mill started up Thursday morning with a full crew and will continue to run steadily. The company has enough ore in sight at the Melvina to keep the mill running for years, and the building of another mill of at least 100 stamps to handle the ore from the other mines in the group is assured in the immediate future. A large force of miners has been put to work and indications point to renewed activity on all the properties of the company.

### Nevada.

The 10-stamp mill at the Stanford and the 15-stamp mill at the Delaware gravel mine have resumed operations.

*Transcript:* The long drain tunnel at the Chapman ranch mine is now in 1,000 feet. This tunnel connects with the tunnel that runs from Deer creek through the Champion, Wyoming and Nevada City mines, making an underground passage over a mile long, through which the water from these mines is drained. The tunnel gives 800 feet of backs in the Chapman ranch mine. The shoot of ore that is being run for is a large 4-foot vein 700 or 800 feet long, and which paid well as far as worked.

*Transcript:* I. M. Taylor, W. H. Maher and others have now complete ownership of the Plumbago quartz mine at Moore's Flat, having made the last payment of $12,500 to Chas. Heggarty a few days since. The price paid was $25,000 and the purchasers are well satisfied with their bargain.

The mill at the Delaware drift gravel mine is running, fifteen stamps being used to crush the cement and gravel that is being taken from the channel which was struck recently.

### Placer.

The following are present dividend-paying mines in the eastern part of the county: Morning Star and Big Dipper drift mines, Iowa Hill; Pioneer quartz mine, near Damascus; May Flower drift mine, Forest Hill; American Bar quartz mine, near Michigan Bluff; Hidden Treasure drift mine, Sunny South; Herman quartz mine, Westville; Page & Buckman quartz mine, Westville; Golden River mine, Red Point.

A 20-stamp mill at the Pioneer quartz mine, Damascus, produced during February, $17,512.

AT OPHIR.—The Green mine is about to start up again under Superintendent Ruse.

### Plumas.

*National-Bulletin:* The Quincy M. and W. Co., at Spanish Ranch, has one large stream doing execution at Gopher hill and another at Bean hill.

In the Hibernia quartz mine, near Greenville, a 12-foot vein of ore is struck. The owners have drifted 80 feet along the side of this ledge and the ore gives a fine prospect.

### San Diego.

At Julian a satisfactory crushing of 93 tons of ore from the Ranchita mine last week went $40 a ton.

The Elevada mine is sold by Holland Bros. to Denver men.

### Shasta.

About 150 tons of ore are daily hauled from the Mountain mine to the smelter at Keswick.

*Free Press:* Rhodes, Fowler & Benton of Harrison gulch shipped 200 ounces of gold bullion to San Francisco Thursday night. The brick was the result of a three-weeks' run with W. R. Conant's Kendall mill.

The Quartz Hill property has been bonded to a New York syndicate by Mr. Campbell, of San Francisco, who succeeds Mr. Humphreys as superintendent of affairs. There is a ten-stamp mill on this mine. At the Commodore mine, owned by Humphreys, Billups & Quigley, a tunnel has been run 125 feet to tap the ledge, which has been opened up a distance of 200 feet. In this distance two raises have been made on the pay chute to a height of 70 feet each, from which $30 ore is taken. A shaft was also sunk on the four-foot ledge in the tunnel, at a distance of 25 feet on the ledge, and this shaft furnishes $60 rock. Tunnel number two is now being run at a depth of 350 feet to tap the ledge lower down. The length of this tunnel is to be 210 feet.

### Siskiyou.

MINING NOTES.—*Journal:* Eastlick Bros., at Oro Fino, expect to make a good cleanup this season. The water supply is abundant at present, but it is probable it will not hold out as long this year, as the snowfall in the high mountains was smaller than usual.

The ditch of the Seattle placer mine, near Nolton, in western Siskiyou, is completed. Early in June they expect to turn 1000 inches of water onto the Shinar mine, and the people of that section of country familiar with the property claim they will take out $100 a day.

The Columbia mine at Scott Bar was redeemed this week by Mr. Dennemeyer of San Francisco. There is a 5-stamp mill on this property, operated by water power.

### Trinity.

*Journal:* The Minersville H. G. M. Co. is running night and day. Three giants are working steadily and twenty men are employed.

### Yuba.

The Marysville *Democrat* says the barge, with machinery, that was bought at Oroville last summer and floated down the Feather to that city and then taken up the Yuba about ten miles, has not proven a success. The intention was to dredge and use other means operated by stream, and machinery carried on the barge, that the gold on the bedrock of the stream could be obtained. The deposit of rock and gravel was too great to reach the bottom with such machinery and to raise the pay dirt.

## NEVADA.

### ESMERALDA COUNTY.

J. M. McSwain has made a strike near Cambridge, on the east Walker river, and has sunk a shaft 20 feet and has a 6 to 8-inch ledge of ore that will average $290 in gold. This ore is being hauled to the Gignoux mill and the mill will be started next week.

### EUREKA COUNTY.

The Ruby Hill Tunnel and Mining Company at its annual meeting elected B. F. McEwen secretary and treasurer and A. Laird superintendent.

### LYON COUNTY.

The Dayton *Times* says: The old Rock Point mill resumed for a steady run on ore from the Logan and Hully mine in Como. Ten stamps will be kept busy. The ore is free milling gold rock which averages $20 per ton, possibly more. It will be worked by the continuous process, doing away with the tanks and slum shoveling, the pulp passing directly from the stamps into a string of pans—seven in number—and then into four settlers. Before the pulp reaches the pans, however, the pulp passes over a set of riffles which are for the purpose of catching the gold that may be in a condition to catch before it reaches the pans. The process is similar to the Boss process, with some changes made by Messrs. Hully and Logan, who are experienced millmen.

## OREGON.

### LANE COUNTY.

*Journal:* The Champion quartz mine, in the Bohemia district, will resume operations shortly. The mine was shut down last January on account of snow.

### JOSEPHINE COUNTY.

L. L. Jewell of the firm of Jewell & Dodge has bought the Jewett mine, near Grant's Pass, and talks of putting a large mill on the property.

## WASHINGTON.

About 300 assays have been made by Spokane assayers of ores from the Colville reservation since its opening to mineral locations. A few of these have shown good values, and the ores are of the same character as those found in the Boundary and Trail Creek districts, but the vast majority of the assays have shown little or no values and offer very little encouragement to locators of claims. The ores for the most part are copper and pyritic, though there have been assayed a few samples of free milling rock said to offer an encouraging outlook, says the Spokane *Miner*.

W. Donohue, of Pesbastin, says the cyanide process has recently been given a satisfactory test there. A run was made last week on the tailings of the Blewitt mill, which had been considered worthless, and they yielded $9 per ton under the process. Concentrates have also been treated with the most gratifying results, a yield of $220 to the ton having been secured, as against $160, at the Tacoma smelter. The ore, which is first reduced to a pulp, is treated to a solution in large vats. In passing over plates, which are connected with an electric battery, the mineral contents are deposited, and after the solution the plates are scraped and the amalgam is ready to be retorted. The plant has a capacity of twenty-five tons a day.

## BRITISH COLUMBIA.

The matte shipments from the Nelson smelter for the week ending March 21st aggregated 213,565 pounds, valued at $26,045, according to entries made at the Custom house. The *Tribune* says, "during the week the ore smelted yielded a ton of silver."

At Trail Creek the Le Roi has three shifts of men sinking the shaft. When the work of sinking was suspended a short time ago it was down 432 feet. It is now proposed to go down another 100 feet. Owing to the hardness and toughness of the rock, only about nine inches of depth can be attained daily.

## ALASKA.

The Apollo Consolidated gold mine is in a remote position, lying about 1000 miles a little south of west from Sitka, on the island of Unga. It is a property of considerable importance, inasmuch as its yield is at the rate of about $300,000 a year. It is also of much geological interest, says Prof. Becker in the *Cosmopolitan*. It is sunk on a zone of fracture in lava (andesite) of Tertiary age, resembling in this and other respects the deposits of Bodie in California. The age of the lava is determined by the occurrence of fossils in immediate connection with the same rock at a distance of a few miles from the mine. The dislocating forces have not opened a clean fissure in the developed position of this property, partly on account of the rock's own irregular structure, and partly because the present workings are near the original surface. It is manifest that any fissure as it reaches the surface will tend to divide into branches and to splinter the rock, because the walls at the outcrop are free to yield in various directions. The fractured zone shows many irregular interstitial spaces, which have been filled with quartz, this mineral crystallizing by preference on fragments of lava with a very pretty radiated structure. The ore possesses two striking peculiarities. A very large part of its value (eight or nine dollars per ton) is due to the presence of finely divided free gold which is not mingled with sulphurets, and is so abundant as to often stain the quartz yellow. Sulphurets occur in about the ordinary quantity, but they are usually massed in the neighborhood of the gold instead of being mingled with it. The ore also contains at some points considerable quantities of filamentous native copper, a very rare constituent of gold ores. Of course, its presence proves that gold and copper are deposited under very similar conditions. Though there are no other working mines in this area, prospecting is in progress, and there is reason to believe that the product of the region may reach much larger dimensions.

Near Dalaroff bay, on the island of Unga, in the Shumagin archipelago, a thousand miles southwest of Sitka, the Apollo Consolidated mine is now yielding at the rate of $300,000 a year.

*News:* N. S. Trowbridge arrived at Sum Dum on the Al-Ki and will at once begin work for the season on the now famous Bald Eagle mine. He brought up twenty-six men and a summer's outfit, consisting of seventy-eight tons of general merchandise.

*Record:* The 10-stamp mill of the Alaska-Willoughby Mining Company is in operation. There is now sufficient water-power to keep the stamps dropping. The tunnel is in 50 feet on the Tellurium vein.

The Glacier mine on Sheep creek is turned over to the Nowell Gold Mining Company. The new company, which has also secured the interests in the Silver Queen mine and workings, the Silver Queen being the east extension of the Glacier, is now making an addition of ten stamps to the Silver Queen mill.

## UTAH.

In the Bullion-Beck mine at Eureka, a fine body of ore has recently been cut on the 700-foot level, 250 feet north from the shaft, that shows values of sixty ounces silver and 30 per cent lead to the ton. A diamond drill was recently started in the Bullion-Beck mine, the power being compressed air.

Of Camp Floyd—Mercur mining district—J. E. Spurr, in the U. S. Geologic Survey report, says the veins are true contacts of lime and porphyry; the mineralization occurred from below, that of the silver vein through an aqueous solution, and that of the gold ledge, at a later period, through gases and vapors; the region of greatest mineralization is the lower point of contact between the second or middle sheet of porphyry and the lime, and immediately below such point of contact; the form or state in which the gold was deposited has not been determined, but it was probably a telluride, as traces of tellurium have been found in the unoxidized ores; in the oxidized ores the gold is probably now in a free or metallic state, but of invisible fineness; the mineralized zone is about 1000 feet wide and of undetermined length. The opinion is advanced that as greater depth is attained the character of the ore will change, tellurium will be found, higher values obtained, and smelting will then be the method of treatment.

*Tribune:* Col. Heffron, manager for the Niagara Mining Company, says that in view of the enactment of a law prohibiting the mines and smelters from working an employe longer than eight hours a day, the projected mill on his property at Bingham would not be built.

## IDAHO.

(Special Correspondence.)—P. J. Cirkel, general manager Yellow Jacket Company, told me on his return from New York last Thurs-

day that the Idaho Yellow Jacket mine and mill properties have been sold to New York capitalists for $1,000,000. The new company will make no changes in the management for the present. They are running 200 tons of ore through their sixty stamps per day.

Mr. H. H. Armstead, superintendent of the Idaho Chemical Gold Mining Company, tells me that they will have their 50-ton chemical plant in operation by May 15th. This company have a 10 stamp mill on their property but were unable to make the ore pay by the amalgamating process.

James Short has just returned from Wilson Creek, a new camp struck last fall, 18 miles west of here, and reports things looking well. Of thirty different veins examined, twenty-six showed gold in the cropping. There will undoubtedly be a great rush in there as soon as the snow is gone, as the ore is reported rich. Rasor, Short, Ryan and West intend to ship ten tons as soon as they can pack it out, which they claim they have sorted to $1000 per ton.

Mr. Sam Wyatt was in last week from Black Bird, a camp struck last summer twenty miles east of here. On the surface everything was free milling gold ore, valued at from $12 to $20 per ton. There have been about twenty men working all winter, and in every instance when they have gone 50 feet deep, the ore has become smelting ore and carries from 10 to 30 per cent copper but retains its value in gold. Most of the ledges are large and increase in width with depth.

The Uncle Sam, at a depth of 100 feet, had 5 feet of solid ore that assayed 29.6 per cent copper and $24 in gold. There are four distinct, parallel veins in this camp, that have been traced from 2 to 3½ miles, and as far as surface indications go seem to be of some value the entire distance. W.

Yellow Jacket, Idaho, April 3, '96.

G. A. Williams, manager of the Atlanta Consolidated, at Boise, says he will expend $200,000 this year in improving the property. It is his intention to put forty more stamps, making sixty. There are forty men employed at the mine and mill.

Nebraska men interested in placer properties along the Snake river have incorporated as the Hydraulic Placer Syndicate, $50,000 capital stock and built a boat at Lewiston 89 feet long, 21-foot beam and with the machinery on board drawing 20 inches, with two lengths of Howe trussing. The hull is divided into six compartments. A steam pressure pump will supply 1,500 gallons of water 100 feet high per minute for giant purposes and will use eight-inch steel riveted pipes. There is a centrifugal pump that will furnish 3,000 gallons per minute for sluice head and will use 15-inch steel riveted pipe. This will be submerged through the bottom of the boat into the river and will be operated by a 40-horse engine, which will also be used to propel the boat. The gold will be saved by concentration of riffles with sluice boxes lined with steel plates to be used. About 2,000 yards of dirt per day will be handled and the boat will be lighted by large locomotive headlights enabling three shifts to work. Eighteen men will be employed.

### MONTANA.

*Inter-Mountain:* The strike in the Homestake mine east of Butte is important. Copper ore of profitable grade has been discovered where mining sharps of local, national and international fame have said it could not exist.

The report that Hamilton Smith is due on the 22nd inst. has awakened much speculation in mining circles, but whether there is any truth in the story that a deal is on for the remaining three-fourths of the stock in the Anaconda is not known. The *Inter-Mountain* believes that Mr. Smith would like to make the purchase, but it is doubtful whether he can swing money enough to take it in, or that it is for sale.

The big strike in the Moonlight by Dave Bricker seems to be misunderstood as far as it relates to the Butte & Boston Blue Jay. It is James A. Murray's end of the Blue Jay that the Bricker body of ore runs into. Murray has the big end of the Blue Jay.

Good reports come from the Boston & Montana smelter at Great Falls, and from the company's mines in Butte. The entire enterprise is in fine shape, and the cost of producing copper is so low that the stock remains high. The company is opening new ground all the time, and keeps well ahead of the smelter.

The Colorado, Clark's & Heinze's plants are all running as usual, and making a good record with steady profits to the shareholders.

As to the silver mills, they were all closed down by the last Democratic congress, but the Alice is now running forty stamps on company and custom ore together, and making a little money under the economical and skillful management of Captain Buzzo.

During the week the financial committee having in charge the matter of saving the Butte & Boston from total wreck has been in consultation with the receivers and it is likely that a plan has been outlined by which it is expected that operations may be resumed. It is said the first mortgage bonds will be paid, and that the second mortgage will be settled on the basis of fifty cents on the dollar.

The Duck Creek mines, twelve miles from Townsend, have been sold to St. Paul, Minn., men for $50,000.

G. F. Bartlett has put in two Bryan mills on the Old Ambler M. Co.'s property, York gulch, Meagher Co. The ore averages $10 per ton. Thirty-five men are employed extracting it from a slate formation under the management of Prof. Kerr.

### SOUTH DAKOTA.

Black Hills *Times:* The cleanup of the Homestake mills for last half of March, amounting to 10,000 ounces of gold run into five bricks, was shipped to the Park National bank of New York yesterday via American Express. This is one of the largest cleanups yet made by the company from a run of 15 days. The approximate value of the five bricks is $200,000.

### MICHIGAN.

John Birkinbine says: "As illustrating the depths reached by some of the mining operations of Lake Superior and the relations which the mouth and bottom of various shafts bear to the level of the ocean and that of Lake Superior, it may be stated that in the copper region the work has been carried to a depth of nearly one mile from the surface, those interested in these exploitations anticipate no unsurmountable difficulties in reaching depths of 10,000 feet. The surface at these mines approximate 650 feet above Lake Superior, or 1250 feet above sea level, but the vertical shafts of the Tamarack and Calumet and Hecla, the slopes of the Quincy and other mines extend far below the water level of Lake Superior and of the ocean, and the Silver Islet workings were carried from a few feet above the lake level to below ocean level. The iron mines are located from 550 to 1200 feet above the level, and although a number have been exploited to or below lake level, but a few have been carried to depths below ocean level. The high temperatures experienced in the Comstock lode and other deep workings in the western States is not apparent in the Lake Superior mines, which have penetrated the earth for great distances. The increase in temperature is not great, and at 1500 feet the mine water becomes saline, but as greater depths are reached more objectionable characteristics are noticed, the water becoming so acrid as to destroy books and clothing and affect the skin. In some of the iron mines ore is dug from 500 to 700 feet below the surface and delivered on cars for shipment for less than 70 cents per ton. This includes wages of miners, cost of light, explosives, timbering, etc., surface and machinery attendance, repairs, and all charges except royalty, general administration and interest on investment. During the business depression which has characterized the past two years, millions of tons of iron ore have been mined in Lake Superior region, shipped by railroad from 15 to 90 miles to ore docks, transferred to vessels and carried from 600 to 1000 miles, unloaded and delivered on cars at lower lake ports for from $2 to $3 per ton. Although little if any profit (after paying royalties or interest) resulted from these low prices, the possibility of accomplishing the above result is a credit to the skill in mining, transporting and handling large quantities of ore."

### COLORADO.

(Special Correspondence)—The Mayflower Gold Mining Company, incorporated in October, 1894, capital stock $1,000,000, has its principal transfer office at Colorado Springs. H. P. Lillibridge is president, E. F. Smith vice-president and treasurer, W. S. Reynolds secretary, S. B. Stewart superintendent. These, with Joseph Newell, constitute the board of directors. The company owns the patented claims Mayflower, Highland Chief, Ute, Beaver Springs, Placer No. 1 and 2, comprising 52 acres, and the Alva lode of six acres in process of patenting. All these claims are located one mile southwest of the town of Gillett, in the Cripple Creek district. Development of these claims is at present being pushed by the company. It is the intention of the board to lease part of their holdings on the Highland Chief. The shaft is down 100 feet and will be put to a depth of 200. On the Ute two shafts are going down on what appears to be two different veins. On the Mayflower a tunnel and shaft are being operated in low-grade ore. All this work has been done and is being done with proceeds of sale of treasury stock, which is not yet listed on any of the stock exchanges. There still remains for disposal about 70,000 shares of the treasury stock.

The Apex, on Phonolite mountain, abutting the townsite of Gillett, is preparing for regular shipments of ore.

Thirty carloads of ore from Cripple Creek were received for treatment at the El Paso reduction works at Gillett last week.

The Little Pittsburg properties, west of Gillett, are being retimbered preparatory for vigorous work this spring.

A strike has been made in the Maggie Weymer, near Gillett, about a quarter of a mile south of the Lincoln. The ore assays $40 to the ton in gold.

The Lincoln is now down 130 feet. Three shifts will continue sinking until a depth of 200 feet is gained. There is two feet of ore in the bottom of the shaft. Picked samples assay $340 to the ton.

The King of Diamonds commenced shipments from the north drift last week.

John Hestin and associates of Gillett have taken a bond and lease for $30,000 on the Black Wonder.

The old Summitt mill near Gillett is being overhauled and will soon start up again with 30 stamps and Hartzell concentrators. Denver and Boston parties are at the head of the enterprise.

The Pontiac tunnel on Oil creek, near Gillett, now in a distance of 120 feet, has gained a depth of 140 feet. The breast of the tunnel is low-grade ore, and the management is arranging for the erection of a mill for its treatment. The tunnel is a mile north of Gillett.

A new property which shows up well in the vicinity of the Lincoln, near Gillett, is the Eva Ray. A vein 3 feet wide has been encounted in the 40-foot shaft which averages $35 to $40. A contract has been let to sink an additional 100 feet.

Phonolite, the rare eruptive rock about which so much has been said since the discovery of gold at Cripple Creek, is made up of a compact matrix of sanidine (or oligoclase) and nepheline, with hornblende, leucite, nosite, and some magnetite. It its fresh state it is dark greenish gray or yellowish, showing single cleavage surfaces of sanidine. The mass is, as a rule, somewhat slaty or schistose, or of thin tabular jointed structure, and gives, under certain conditions, a clear sound when struck with a hammer (whence the name); on weathering, a sharply defined yellowish-white or white crust is formed. Sanidine and oligoclase are glassy varieties of feldspar. The former is one of the varieties of orthoclase and the latter an intermediate between albite and anorthite feldspars. The matrix or ground-mass of phonolite is micro-crystalline, and presents either a rough and porous, or a compact character. The nepheline crystals, which occur in six or twelve-sided prisms, are, as a rule, very minute, although they occasionally attain moderate dimensions. In some phonolites they are very numerous, while in others the mineral is so poorly represented that the rocks approximate to trachytes. Hauyne is often very plentiful, and there are few phonolittes in which it is totally absent, except in those rocks in which leucite takes the place of nepheline. The minerals which are less common, and less important as constituents of phonolite, are augite, olivine, sphene, zircon, apatite, and titaniferous iron.

Phonolite is partly soluble in hydrochloric acid, the soluble portion being represented by nepheline and zeolitic decomposition products of that material, while the feldspathic portion of that matrix constitutes the insoluble part. The phonolites fuse easily before tee blowpipe to a whitish or greenish glass, and yield more or less water when heated. Phonolite occurs occasionally in the form of lava flows, but more commonly in conical masses or hills. It sometimes exhibits well-marked columnar structure, and has a very general tendency to split into slabs or slates, the more finely cleavable varieties being used for roofing purposes in certain localities. The ringing sound is observed in thin slabs of unweathered rock.

The foregoing is a general description of phonolite. Following is the special description by Dr. Cross of the rock found in the Cripple Creek district:

The region about Cripple Creek is specially characterized by many masses of the rare igneous rock, phonolite, elsewhere known in the United States only in the Black hills of Dakota. Phonolite is a rock allied to trachyte but characterized by the presence of nepheline, in addition to alkali-feldspar, a result of its richness in soda and a low percentage of silica. The phonolites of this district are, when fresh, dense greenish-gray rocks, often with a sub-viteous luster. They are usually somewhat decomposed, however, and are then dull, yellowish-brown, straw-colored, pink or white. Some of the rocks of the region have no distinct crystals visible to the naked eye; others have small glassy tablets of sanidine and dark-green prisms or grains of ægirine, a soda-bearing pyroxene; and a few, notably a rock occurring near Altman, on Bull mountain, carrying large tabular crystals of sanidine, giving the rock a typical porphyritic structure. The bleaching of a thin outer zone by weathering, and a pronounced tabular jointing, are thoroughly characteristic features of this rock type. It occurs in numerous narrow dikes, both within and without the main volcanic area, and is the only one of the volcanic types having such a distribution. It also occurs in several isolated bodies capping granite hills or mountains for some miles on all sides of the center, as in Trachyte, Big Bull, Cow and Nipple mountains. These masses are thought to be remnants of large inclined dikes in granite. This origin is further suggested by the phonolite bodies of Grouse and Straub mountains, which are clearly lateral intrusions into the High Park lakebeads, near the granite surface. No surface flows of phonolite are now identifiable.

Phonolite was a product of several epochs of eruption, for a part of the breccia contains phonolite fragments, and this breccia is cut by phonolite dykes. In addition to the alkali feldspars, it consists of nepheline, sodalite, nosean, and pyroxene which is in great part ægirine. Accessory minerals are sometimes present, the most notable ones being lovenite and a peculiar blue amphibole. Analcite occurs in drusy cavities in certain places.

R. J. Jackson, who recently visited the Johnston mine at Pearce district, has returned to San Francisco, and is writing his report. At fifty-five feet on an incline, where the ledge was first tapped, the ore is reported to average $20 per ton.

The Mollie Gibson Mining Company has $100,000 cash on hand, and is out of debt. The last dividend paid was in January, 1895.

Georgetown *Courier:* On Saturday last the connection was made between the level from the Lamartine shaft and the drainage tunnel. The length of the tunnel to the shaft is 4,508 feet. The work was commenced on Oct. 4, 1894, and the cost was nearly $60,000. It is estimated that the tunnel will make a saving of $100 a day in fuel alone. The size of the tunnel is 8x8 feet, and it will have a 20-inch track, with four-ton cars, which will eventually be run by electricity. In driving the tunnel five cross veins were cut. In December last a large body of ore was encountered which was continuous for 300 feet. An upraise will be commenced to ascertain its height, the distance to the surface being more than 600 feet.

Cripple Creek *Times:* Thirty men are employed at the Ingham mine, on Raven Hill. The mine was never making so good a showing or producing so much rich ore as now. A shaft is being sunk on the Rose Maud to catch the Doctor vein.

Fifty men are working on the Dante claim, on Bull Hill. At the Johnson shaft, the vein has been sunk on 150 feet and the contract has been let for another 150 feet. Another vein was opened in one of the drifts from this shaft, and ore has been encountered in all the headings.

*Mail:* W. S. Stratton has closed down several of his mines this week and cut the force on the Independence. This caused a great deal of talk in camp and outside, but the act was a matter of business. A new mill is being built just below the dump at the Independence mine for handling low-grade ores and what is now the waste rock of the mine. The mill is being built by a Mr. Peck and will employ a new process, which is claimed to be a very superior one for the treatment of low-grade ore. When the mill has proved a success it is expected that it will be purchased by Mr. Stratton. Under the present system of working the mines, taking out the high-grade ore, it is necessary to break and handle large quantities of the low-grade, and to avoid the inconvenience and unnecessary expense of providing new ore bins, it has been decided to await the time when the mill will be ready to treat the ore as stated, and all classes of the product from the mines can be handled at the same time. Work is then to be resumed with increased force in all the mines.

During March, says the Denver *Record*, there was paid into the office of the State $24,500 as fees for incorporation of mining companies.

The Silverton *Industry* says: The wonderful gold discoveries and output of San Juan county have so far overshadowed the silver interests that it may be doubted that we were entitled to the name of "Silver San Juan."

At Leadville the present daily tonnage approximates is about 1600 tons. About 60 per cent of this is iron ore. The rest is carbonate, sulphide and silicious.

### NEW MEXICO.

Hemetite mining district, northwest Colfax county, is reported taking a prominent place among gold producers. It is virtually the old Elizabeth town district, revived by new lode discoveries. More than $1,000,000 was washed from these fields by crude placer methods. The Maxwell land grant covers this section of the country.

Silver City *Enterprise:* At Hanover the New Mexico and Arizona Smelting Company has fourteen men at work on the Guadaloupe, Yosemite and Chimo copper mines at Santa Rita. The mines are owned by the Santa Rita Copper Company and are being worked under lease by the Smelting Company. All three of the mines are producing fair quantities of good copper ore.

The New Mexico and Arizona Smelting Company of Ivanhoe has resumed. The shortage of water at Pinos Altos curtailed the supply of sulphuret ores produced by concentration and the smelter was compelled to suspend operations temporarily.

Silver City *Sentinel:* The new company which is operating at Carlisle are preparing to do some deep development work soon. They will put down a number of 500-foot shafts on their different claims. They have bonded the Alabama mine and active work will be pushed on it.

SONORA.—The Yaqui and El Tiro mines in the Altar district have been sold to an American company, through Johnson, for $30,000.

A letter from the Minas Prietas to the Yuma *Sentinel* warns miners to stay away from that camp. The writer says that while wages are fair most of the men are not able to work more than one-half of the time. He says that the camp is overrun with Americans who visit there hoping to get something to do and that nine out of ten are disappointed. These men, he says, are without means, and concludes with, "being broke in Mexico and Arizona," are two widely different things.

### ARIZONA.

The United Verde Copper Company at Jerome is laying a pipe line to the top of the mountain, south of the town of Jerome, to carry off the fumes, smoke and dust from their smelters.

The Westinghouse interests are reported to have secured control of the Washington camp group of copper mines, and will take possession of the defunct International Copper Smelting plant in El Paso, Texas.

The *Gazette* says the Congress mine will shortly be fitted out with double its present capacity, increasing from forty to eighty stamps, enabling the running of 300 tons instead of 150 per day as at present. There are now 350 men working and houses building on every hand.

The Prescott *Journal-Miner* reports that the Commercial Mining Company has men at work developing the Iron Queen mine, an extension of the Boggs, in Big Bug. They have the shaft down 80 feet.

General Manager Frost of the Leland Stanford mine on Groom creek has abandoned work in the old shaft on account of not finding anything to justify further development in that direction.

The T. M. & M. Company has started its cyanide mill at Tombstone, employing fifteen men.

### SOUTH AFRICA.

SIMMER AND JACK.—Johannesburg *Mining Journal*: The directors submit the following summary of operations for January: Quartz milled (100 heads), 10,400 tons of 2,000 pounds, yielding 4,196.3 ounces smelted gold, taken at 72s per ounce—£15,106 13s 7d; chlorination, 621.42 ounces from concentrates—£,2485 13s 7d; tailings treated, 5,280 tons, yielding 1,502.47 ounces smelted gold—£4,507 8s 2d; total value, £22,099 15s 4d. Cost, £11,686 4s 5d: Mining and hauling, 14s 7.30d per ton; transports, 5.49d; milling, 4s 2.62d—19s 3.41d per ton; general charges, 3s 2.27d—22s 5.68d; expended on mine development, 5s 11.67d per ton—£3,105 12s 8d; total per ton, 28s 5.35d; cost of treating concentrates, £458 10s 8d; cost of producing concentrates, £353 6s 11d; cost of treating tailings, £1,148 11s 9d—£5,066 2s; total cost, £16,752 6s 5d. Profit for month, £5,347 8s 11d. Capital account: Expended on plant and buildings, new shafts, etc., £21,444 18s 9d. Mine development: 949 feet sunk and driven, developing approximately 18,990 tons of ore.

# The Pelton System of Power

Represents the highest development yet attained in water wheel practice and affords the most simple, efficient and economical means of utilizing water for power purposes.

## Six Thousand Wheels Now Running,

Aggregating over 400,000 horse power. Adaptation made to all conditions and every variety of service.

## Electric Power Transmission.

PELTON WHEELS are the recognized standard for electrical work and are running a majority of the stations of this character in all parts of the world.

Catalogues furnished upon application. Address

# MINE BELL SIGNALS.

Adopted, Used and In Force in Accordance with State Law.

FOR THE CONVENIENCE OF OUR READERS IN THE MINING COUNTIES WE PRINT IN legal size, 12x36 inches, the Mine Bell Signals and Rules provided for in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Mine Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness, for 50 cents a copy. MINING AND SCIENTIFIC PRESS, 220 Market St., San Francisco.

## Coast Industrial Notes.

—Since the extensive planting of eucalyptus trees in southern California there have been fewer drouths there.

—W. H. Holabird, who recently bought the San Diego cable railway for $55,000, will change it to an electric road.

—Winemakers in Sonoma county are contracting for next season's grapes at $15 per ton, an advance of $3 over last year's prices.

—The Southern Pacific Co. is reported to be withdrawing its accustomed subsidies to sundry San Francisco and Los Angeles newspapers.

—To Fresno last Monday the first current was sent over the wires from the powerhouse on the San Joaquin river, thirty-five miles distant. The experiment was successful.

—The Chino ranch, San Bernardino Co., is sold this week to English parties for $1,600,000; ten per cent cash, $550,000 in four months, balance on time. The new owners will colonize it.

—A general strike was begun by the labor unions of this city last week, and several hundred men quit work, awaiting further instruction from their leaders. This week they resumed work under former conditions.

—Columbia river, Or., salmon canners have formed a protective association and say they will pay the fishermen four cents a pound for salmon bought of them. The fishermen who also have an association demand five cents a pound.

—The Harlin Car-Coupler Company has incorporated at Stockton; capital stock, $250,000, $216,750 subscribed; J. J. Scrivner, San Francisco, J. Simon, O. B. Parkinson, G. C. Harlin, J. Reine, Stockton, A. Dinsmore, Seattle, Wash.

—The President of the Southern California Fruit Exchange estimates the season's crop of California oranges at 9000 carloads, or 2,700,000 boxes—an increase of about 400,000 boxes over last year.

—S. L. Hanborough proposes to sell this city a lake in Monterey Co., supply sufficient water for all purposes, construct mains and have the works in operation in 18 months, for $12,000,000. The Board of Supervisors have the proposal under consideration.

—President A. C. Sheldon of the Rio Verde Canal Company, Phœnix, Arizona, has gone to Minneapolis, Minn., with $2,400,000 bonds which have been disposed of. The money realized from the sale of the bonds will be applied to the completion of the canal, dams and reservoirs now being constructed by the company.

—The San Francisco Street Superintendent and City Surveyor are at present engaged in an unsuccessful attempt to repeal the law of gravitation by having sewers constructed from 12 to 24 inches higher than the lesser ones they are supposed to drain. As the plans are unaccompanied by pumping specifications it is believed the effort will be abortive.

—A beginning has been made in actual railroad competition with the Southern Pacific Co. in this State. Last Saturday the first wheat ever moved from the San Joaquin Valley by any other than a Southern Pacific engine was carried over the S. F. & S. J. V. R. R. from Escalon to Stockton. The road is now completed from Stockton to beyond the Tuolumne river, and forty miles of it is in operation.

—The Nevada Co., Cal., narrow-gauge road running from Grass Valley and Nevada City to Colfax reports gross earnings for 1895, $108,460.89; gross earnings for 1894, $98,794.89; increase of earnings over preceding year, $4666; total amount of expenses including taxes and interest on bonds for 1895, $104,854.03; total amount of expenses, 1894, $102,520.95; increase of expenses over preceding year, $2333.08.

—The new steamer President, built by the Fulton Engineering and Shipbuilding Works for the Alaska Packers' Association, was successfully launched at the company's works at Harbor View last Wednesday under the supervision of Jas. Spiers and L. Heynemann. The vessel is specially constructed for hard work in northern seas, and will make her trial trip next week.

—This week the Lighthouse Board awarded contracts for supplies for the Twelfth Lighthouse district for the fiscal year ending June 30, 1897, as follows: Coal—John C. Wilson, San Francisco, $5.49 per ton in bulk, $5.74 per ton in sacks. Provisions—Charles C. Pennell, San Francisco, $59.39 per man per annum, on vessels; $36.04 per man per annum at stations. Buoy service, Humboldt bay—Henry Smith, Eureka, $210.

—During '95 seven steamers loaded lumber on Puget Sound for Delagoa bay, South Africa, carrying 15,000,000 feet, which cost in Tacoma $8 per M. It costs $17 per M. to Delagoa bay, making the cost there $25 per M. It is 360 miles from Delagoa bay to Johannesburg, where most of the lumber goes. The railroad company charges $50 per M. for carrying it those 360 miles. By the time the lumber is retailed at Johannesburg and other cities it costs the consumer nearly $100 per M.

—April 2d was the date originally set for the opening of the Mexican international exposition in the City of Mexico. Owing, however, to delay in the erection of some of the buildings, the formal opening has been postponed until September next. The enterprise is under the administration of a company of Mexicans and Americans, with a capital of half a million dollars, and the exposition buildings, when completed, will cover an area of 600 acres in the suburbs of the city.

—Some of the features of the engineering work upon the Nicaragua canal were discussed before the House Committee on Commerce at Washington, D. C., last week, from the standpoint of engineers experienced in large enterprises, who described the dredging machines and operations on the Chicago drainage canal, and asserted that by the same machinery and method the work on the Nicaragua canal would be done for less than the company's estimates. The construction of the canal would inaugurate a new era for us.

—The usual annual "strike" of the salmon fishermen at the mouth of the Columbia river, and the regular April discussion regarding modes of catching fish whether by traps or gill nets is on. The season opened yesterday and in thirty days all hands will be at work reaping a golden harvest in a little strip of water from which annually without any preparatory sowing or cultivation a crop worth $3,000,000 is harvested.

—W. F. Pierce and other Oakland, Cal., men have capitalized the Blue Lakes project and propose to establish an electric plant at Tripp's Mill, Mokelumne Hill, Calaveras Co. A canal 3000 feet in length and having in that distance a fall of 1043 feet, will convey the water from the high level above to the bottom of the canyon, where electric apparatus will develop 6000-horse power. In setting up this plant and establishing power wires to Stockton and other places, it is stated $500,000 will be spent.

—Keys & Son of Mayville, Gilliam county, Or., have sold all their cattle, 500 in number, to W. M. Butler, who is buying for the Montana Mining & Livestock Company, which owns and operates the Anaconda Smelting Works. The prices paid were: Three-year-old steers and over, $22; 2-year-old steers and cows, $15; yearlings, $11. This will make an average price of $16 per head for the band. The cattle are to be delivered at Arlington May 10th. Mr. Butler expects to ship altogether about 1200 head from Arliugton next month.

—Samuel W. Allerton and other Chicago men have a concession from the Mexican Government to build 400 miles of railroad along the west coast of Mexico, connecting Toetillan, a terminal of the Mexican Government railroad, with the Guatemala frontier, eighteen miles east of Tapuchula. The concession is accompanied by a subsidy of $2,500,000 worth of Mexican lands. Thirty-five miles of completed roadbed, built by the Baring Bros., which reverted to the Mexican Government when that firm failed, will be presented to the new company, which now has a representative in London seeking to interest English capital in the enterprise.

—The Puente Oil Refinery at Chino, Cal., has commenced work. It is equipped to produce kerosene, gasoline, benzine, etc. Later, the paraffine base in the crude oil may be utilized. The refinery is supplied with oil from the Puente wells, fourteen miles away, through four and three-inch pipes, the oil flowing by gravity. From tanks the oil is drawn to the stills from whence the vaporized oil is carried in an eight-inch pipe to the coolers, where it is divided into a series of two-inch pipes which run lengthwise through a long flume filled with running water, condensed into liquid form, and emerges into the separator as a distillate, when it is seperated according to its specific gravity into kerosene, benzine, gasoline, etc., and flows into large receiving cylinders, thence is pumped to tanks on an elevated platform and drawn from them into drums and cans. The fuel used, both in the steam boilers and under the stills, is the crude petroleum. The oil itself does all the work, and no part is wasted.

## Personal.

THOS. J. BARBOUR of the Risdon Iron Works, has returned from Butte, Montana.

JNO. W. MACKAY is expected to leave New York on the 20th inst. for this city.

J. C. FRICK has resigned the superintendency of the Old Spanish mine, Shasta, Cal.

JAS. CRONAN is the new superintendent of the Hale & Norcross, vice H. W. Tangerman.

THOS. G. MERRILL of Montana is about to develop the Vanderbilt group at Mercur, Utah.

DR. W. J. CHAMBERS has been appointed general manager of the Acacia mine at Cripple Creek, Col.

CAPT. GILLETTE, of the U. S. Debris Commission, was inspecting debris dams in Shasta county last week.

JOHN TIERNEY will be superintendent and P. Kervin general manager of the Allison Ranch mine, Nevada Co.

JAS. A. EDMAN of Meadow Valley, Plumas Co., eminent authority on gold in black sand in California, is visiting the city.

C. E. UREN of Grass Valley, C. E. Creller of Oakland, and P. A. Wagner of the Judson Iron Works, are examining mines in Shasta.

JULIAN SONNTAG goes to Bakersfield, Kern Co., this week, to do some missionary work for the Manufacturers' and Producers' Association.

W. S. MCCORMICK and W. H. Thomas, two Utah mining men, are negotiating for the possession of a mother lode property near Angels, Cal.

S. H. WILLIAMS, late assistant assayer of the Butte and Boston company, has gone to Coolgardie, Australia, to take a position with a London mining company.

JOHN MOSS, several years assistant local freight agent of the Southern Pacific Company, has been appointed traffic manager of the San Francisco and San Joaquin Valley railroad.

W. R. BUSENBARK of Salt Lake, Utah, arrived here last Wednesday to meet the other members of the party which recently obtained concessions from the Japanese Government that justify them in proceeding with the construction of 800 miles of railway in that empire.

THOS. COUCH, general manager of the Merced Co.'s property in Mariposa Co., goes on a six-months' vacation to England, and talks of a jaunt to Johannesburg, South Africa, before returning to California.

JOHN HAYS HAMMOND and the other members of the reform committee were on the 8th inst. at Pretoria, South Africa, committed for trial at the next session of the High Court on a charge of high treason for their participation in the Johannesburg troubles.

A. S. BIGELOW, president of the Boston & Montana; Thos. Nelson, secretary and treasurer; G. M. Hyams, a prominent stockholder in the company, and M. Meredith, president of the Boston Real Estate Exchange, who have been inspecting the Boston & Montana smelters and the Butte & Boston M. Co. affairs at Butte, Montana, are in this city on a tour of inspection of the Merced Gold Mining Company's operations in Mariposa county, of which they are the owners. They express confidence in the permanence and value of the property, and will go on with the work.

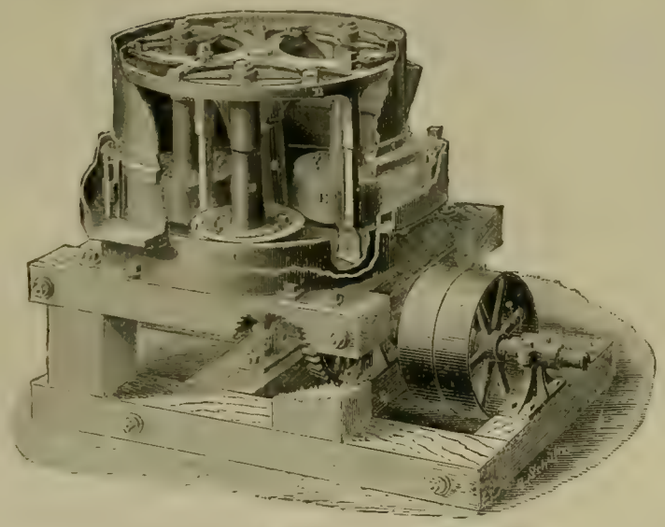
This doesn't happen every day. You can't expect it more than a few times in a lifetime. No one is going to agree and guarantee positively to save you 30 per cent or else no pay unless they know what they are about. You can't expect people to say, "You need not pay for this until you have proved our guarantee," unless they intend to do all that they claim. As a matter of fact, we do more than we claim. We guarantee to save 30 per cent, but actually we save a good deal more.

Have you ever heard of a Double Pipe Air Compressor? It has one disadvantage. It needs twice as much piping as is needed with the ordinary makes of Air Compressors. On the other hand, it has more real, genuine advantages than you can shake a stick at. It will do the same work as the ordinary Air Compressors, such as are in general use throughout the mines on this coast, on 30 per cent less power. We will guarantee this and prove it to your satisfaction, else you need not pay for the Compressor. It weighs less than half as much as the ordinary Air Compressor. It costs less for freights and is more easily carried up into the hills. It shows the same high efficiency at all altitudes, high or low. It takes no more fuel to do the work if located on the highest peak of the Sierras than it would take if located at the sea level. It enables you to buy a smaller boiler than you can use with any other Air Compressor to do your work. It does not overheat the air at the Compressor and freeze it at the rock drill. In short, it is the ideal Air Compressor. It has been tried in practice, and we can show you the highest recommendations and endorsements. We sell it on a strict, positive, iron-clad guarantee If your power costs you anything, you want the Double Pipe Air Compressor, because you can buy it on a guarantee that it will run on 30 per cent. less power than any other make of Compressor. If you have to take a Compressor to your mine over bad roads, you want the Double Pipe Air Compressor, because it weighs less than half as much as any other Compressor. It is cheapest to buy, cheapest to run, cheapest to transport, cheapest to carry anywheres. For pumping it beats the world. You can run it with steam or water.

Write to the Pneumatic Power Co. for further information. If you are in the city and want a compressor, call and see them. They will show you the Double Pipe Air Compressor in operation. Remember you run no risk. We claim wonders, but we have to perform wonders in Air Compression, or else you don't have to pay for the machine. We are ready. Are you?



Pneumatic Power Co., 306 Pine St., Room 10, San Francisco, Cal.

THE OLD RELIABLE
COMMON SENSE STEEL WHIM
STILL STAYS TO THE FRONT.
Over 2800 now in use, which is more than all others combined. We make them for all purposes, all sizes and prices. **Steel Ore Buckets**, all sizes from a windlass to a ton. We press "'em out" 'cause hammer dents make holes, "savy?" **Common Sense Easy Dump Ore Cars.** Center of car body over center of truck, equal weight on each axle, makes equal wear on all the wheels. Incline turn table makes the car dump itself when you press the latch. Send for Catalogue showing dozens of styles of cars for all purposes.
THE WHIM CO.,

Dealer in Gold Mines of Proven Value.

# F. A. HUNTINGTON'S
## Centrifugal Roller Quartz Mill.

THE FOLLOWING WILL EXPLAIN THE ABOVE CUT:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet crushing gold, silver or copper ores, hard or soft, it has no equal.

**Huntington's Improved Rock Breaker.**
**Huntington's Patent Ore Feeder.**

## Commercial Paragraphs.

WHEN the Westinghouse Electric and Manufacturing Co. installed an alternating current electrical power transmission plant at Telluride, Colo., in 1891, the electrical world was very much interested in the operation, because it was the first plant of its kind that had ever been installed in this country. The apparatus had been ordered by the San Miguel Consolidated Gold Mining Co., a corporation owning a vast area of gold mining territory in the Colorado mountains. Hitherto it had been commercially impracticable to operate these mines, because the excessive cost of fuel and power at an altitude of 3000 feet above the sea level made it prohibitive. It was then that electric power was suggested, which promised to overcome the difficulty, especially since the company owned a water fall in the San Miguel valley which contained sufficient amount of water power to operate all their mines, if it could be made available. It was then that it was suggested to Mr. Nunn, the general manager of the company, to investigate the Tesla polyphase system of electrical power transmission. This was done, with the result that a contract was entered into and the Westinghouse Electric and Manufacturing Co. asked to install a 100 H. P. A. C. generator and a 100 H. P. motor, with the necessary switchboard appliances. The generator was connected with a Pelton water wheel and the current was carried for three miles up the mountains to the Gold King mine. The wonderful success of this undertaking was established from the first. The owners of the San Miguel Co. have become so thoroughly convinced of this fact that they recently contracted for an extensive increase in the electrical plant. The additional machines were ordered with the Westinghouse Co. some time ago, and they are now being installed. These machines are two 800 H. P. 500 volt quarter-phase generators, running at 7200 alternations. These generators will be direct connected to two Pelton water wheels, and two 30 H. P. multipolar generators will be operated as exciters. While these apparatuses will be installed in the central power house, the company will have a number of sub-stations at the different mines throughout their property. Among these stations will be distributed twelve 50 H. P. polyphase Tesla motors, fifteen 20 H. P. polyphase Tesla motors, twelve 100 K. W., 100-11,600 volts, 2-phase-3-phase step-up transformers, ten 50 K. W., 10,000-220 volts, ten 25 K. W., 10,000-220 volts, and sixteen 10 K. W., 10,000-220 volts, step-down transformers. The motors will be attached either by belt or direct connected to operate stamps, pans, hoists, crushers, elevators or pumps. It is expected that this installation will prove the most complete electrically equipped mining plant in that State. The Westinghouse Co. will also furnish all the necessary switchboard apparatus with the plant.

THE Pelton Water Wheel Company is running its works to their full capacity. Among the more important installations recently completed are: A 2000 H. P. plant for the San Joaquin Electric Co. at Fresno, running under a head of 1400 feet; a 3000 H. P. plant for the Regla Electric Transmission Co. in Mexico, running under a head of 800 feet; a 1200 H. P. plant for the Nevada County Electric Power Co., running under a head of 210 feet; a 2500 H. P. plant for the Big Cottonwood Power Co., Salt Lake City, running under a head of 400 feet; a 200 H. P. plant for the Tuolumne County Electric Co.; a 250 H. P. plant for the Santa Ysabel mine in Tuolumne county; a 300 H. P. wheel, 18 feet 6 inches diameter, for the North Star mine in Grass Valley, running under 750 feet head; a 500 H. P. wheel for a mining company in Japan. They report also now under construction the following: A 3000 H. P. plant for the Lota Electric Co. in Chile, to run under 600 feet head; a 1200 H. P. plant for the Boza Electric Co. in Venezuela, to run under 400 feet head; a 600 H. P. electric power plant for Colorado Springs, Colorado, to run under 800 feet head; a 600 H. P. plant for the Big Creek Electric Co. of Santa Cruz; an 800 H. P. extension to the Redlands plant; a pair of 400 H. P. hoist wheels for the Central Eureka mine in Amador county; also seven wheels of varying capacity for coffee and sugar plantations in Central America.

THE Redding, Cal., Electric Light Company has received from the Westinghouse Electric Company at San Francisco a complete dynamo of 5000-light capacity to replace the incandescent dynamo now in use.

ONE of the big contracts which the E. P. Allis Company, Milwaukee, Wis., has recently secured is that of the Canal & Claiborne Street Railway, New Orleans, La. The Allis Company will build and furnish the latter concern's power-house with two 450-horse-power-tandem-compound-condensing engines, with Reynold's independent air-pump condensers. The engines and condensers will be equipped with the most modern devices for safety and economy, and will be direct-coupled to the General Electric Company's generators.

EDWARD C. BROADWELL,
Chemical Assayer.
2006 Champa St., Box 840, Denver, Colo.

Chemical assayer; no loss by fire test; truth only; gold, 75c; gold and silver, $1; gold, silver and platinum, $1.25; copper, lead, nickel, zinc, etc., according to difficulty of precise determination; tests for chlorination, cyanide or proper method of treatment.

THE CHRYSOMETER.
A CHEMICAL ASSAY OUTFIT. Anyone can use it. Chemicals enough for 100 assays with each $25 outfit. J. W. PETTEE, Sole Manufacturer, 907 17th Street, Denver, Colo.

## List of U. S. Patents for Pacific Coast Inventors.

**Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.**

FOR THE WEEK ENDING MARCH 31, 1896.

557,351.—MOLD—Geo. Armstrong, S. F.
559,354.—BOILER—M. P. Boss, s. F.
557,253.—BUCKLE—C. A. Conger, S. F.

### A Manual Is Needed for the Neophyte in Mining.

"Send me a book which will show me how to find a mine," writes a Denver *Republican* correspondent in Wyoming. Inquiry developed the fact that no such book has been published. "But why should there not be?" says a well-known local geologist and mining expert. "It is true that nothing can take the place of practical, personal investigation and knowledge of the rocks of the country acquired by painstaking effort in the field, for all the books in the world will not make a miner out of a man who reads them in the grateful glow of a parlor fire by the light of an incandescent lamp. But the inquiry of the correspondent is directly in line with what I have heretofore suggested—that some competent authority write a book on practical geology and particularly on the relations of geology to the precious metals, in language that will not require a geological education for its understanding. This can be done, and it follows as a matter of course that a book can be written which will show the neophyte in mining what kinds of rocks are indications of mineral, what kind are mineral bearing, under what conditions to look for mineral, how to recognize the different kinds of ore, how to make simple tests of values and how to determine the best methods of prospecting when the necessary conditions are found. Such a book might be imperfect at first, for it has been demonstrated recently that conditions of one camp are valueless in another, and it is impossible to say under what new conditions we may find the precious metals, but it would be a long step in the right direction, and as new conditions are discovered they can be incorporated in successive editions. One important result of such a publication would be to stimulate prospecting and consequently discovery. Thousands of young men, ambitious, intelligent and energetic, all over the country, are only deterred from an effort to find a mine which in the popular view stands for enormous wealth, by a dread of tackling the earth's crust with no other knowledge on the subject than the little smattering of geology obtained in the high school. A book which should teach the reader so far that he would pick up a piece of rock and say, 'This is quartz; there must be a ledge of this somewhere in this vicinity, which it is my business to find,' or, 'Here are strata of lime and porphyry in contact, and by following the contact I am likely to find a mineral deposit,' or, 'Here is a phonolite dike in juxtaposition to granite, and a vein of mineral is reasonably certain to be found below,'—such a book, I say, would be of great value, and written in popular style and simple language, would be interesting to anyone, especially in this period of revival in the mining interests of the country.

"Mining has in my opinion come to the front to stay. It will be one of the principal industries of the country from this time forth, and nothing would be more stimulating to this interest than the publication of a book which would tend to popularize a business about which so little is generally known."

[This is published as sufficient supplementary comment on a recent editorial in this journal saying just about the same thing.]

### Making Tight Petroleum Joints.

Mr. Hiram S. Maxim, on materials and methods for making tight joints in petroleum pipes and vessels, says: "Many have supposed it to be quite impossible to make a petroleum joint that would not leak, especially with the light varieties, such as naphtha and gasoline, when subjected to both heat and pressure. However, as a matter of fact, it is no more difficult to make a petroleum proof joint than a water proof joint. In making up steam or water joints we naturally employ something which is insoluble in water. If an ordinary steam or gas fitter is asked to make a petroleum-tight connection he is sure to employ red lead and oil, and for a gasket or washer he is equally sure to use India rubber, both oil and India rubber being quite soluble in petroleum. In my experience I find that a joint which is screwed together dry is less apt to leak petroleum than a joint made up of the orthodox red lead and oil. To make a good petroleum joint with common iron pipes, a very good system is to heat both the male and female threads sufficiently to dissipate every trace of oil; then make the joint up with thick shellac varnish, which may be combined with ordinary dry vermilion or even Venetian red. A joint of this kind I have found to stand well. A very good joint can also be made with ordinary yellow bar soap rubbed into the threads of the pipe, the grease first being removed. Treacle, honey, glue, mucilage or glycerine are quite petroleum proof. For a stuffing box, ordinary wicking saturated with common yellow bar soap may be safely employed. Canvas saturated with shellac varnish makes a good washer, but soft metallic washers are better. A very good flexible diaphragm for a regulator may be made of closely-woven cotton fabric varnished on both sides with a compound of gelatine and glycerine. About equal parts by weight make a very tough and elastic compound. Wooden vessels, bags, etc., may also be made petroleum-tight by saturating or varnishing with this compound. As a rule, all substances which are soluble in water are quite insoluble in petroleum. For stuffing boxes for standing both water and petroleum, castor oil may be employed, as this peculiar oil seems quite insoluble in either water or petroleum."

### A Distinguished Traveler.

In this city on the 2d inst. H. De Windt delivered an illustrated lecture upon "The Prisons of Siberia" before the Geographical Society of the Pacific in their hall on Post street, this city. He was introduced by Prof. Geo. Davidson. He was candid and interesting, took opposite views from those of Geo. Kennan and made out a favorable case for Siberian dungeons. He is a distinguished traveler, has had every advantage of personal inspection and his views are entitled to considerable weight. According to him, Siberian prisons are no worse than many similar institutions and far better than many other penal stations. He did not deny point blank all that Mr. Kennan has so positively affirmed, but simply said "Here are the facts as I saw them." He is now going from New York to Paris by land. He has been to Siberia three times—in 1887, 1890 and 1894—his mission this last time being to visit the Russian prisons, and finally he crossed Asia and Europe, going by land from Pekin to Calais. Upon his return from his last journey, he conceived the idea of the present new expedition. He took passage on an American vessel, the captain of which—an experienced sealer—told him that he had crossed Behring strait on the ice seven times. Mr. De Windt decided immediately that he would try to go from New York to London by Alaska, Behring strait and Siberia, and he has reached this city. At Vancouver he will meet Captain Adair, the sealer, whose stories gave him the idea of crossing Behring strait, and who will accompany him. Mr. De Windt expects to leave Vancouver by the end of April with a party of Indians or half-breeds. The crossing of an unknown part of Alaska will be attended with considerable difficulty, and, in fact, danger. Nulata will be the first inhabited point of American land passed by the expedition, which will, from there, ascend Cape Prince of Wales, so as to cross the strait at the narrowest point. Mr. De Windt expects to cross on sledges drawn by dogs and to strike land in Asia at East cape, from which he will direct his course to Irkoutsk. He has set eight months as the probable length of time required by the journey, a most difficult one because of the cold incident to four months of polar night. The crossing of Behring strait will take about twelve days, on account of the numerous accidents that will be liable to occur to the sledges. Mr. De Windt expects to return to London in the autumn of 1897, and calculates that his long journey will cost him over $25,000.

THE HARRINGTON & KING PERFORATING CO. CHICAGO.

### TRUSTEE'S SALE
IN SIERRA COUNTY.

On TUESDAY, APRIL 21st, 1896, at one o'clock P. M., at the front door of the Court House in Downieville, Sierra county, California, I will sell at public auction, to the highest bidder, for cash, all of that certain mining property, mills, machinery, boarding houses, tools, water rights, dams, etc., of the well known Young America mine, which consists of four contiguous patented claims and other locations; and also about 150,000 tons of tailings stored near the mine, and rich in free gold.

This sale is made by me as Trustee, and to make the sum of about $12,000.

Full information concerning the property and a full description thereof will be furnished on application by letter, or otherwise, to me at 230 California street, San Francisco, or to my Attorney in said matter, Frank R. Wehe, whose address is Downieville, Cal.

JOHN BERMINGHAM, Trustee.

## John Taylor & Co.

63 First St., San Francisco, Cal.

OLDEST AND LARGEST HOUSE ON THE PACIFIC COAST.—Established in 1852.

Manufacturers and Importers of

**ASSAYERS', MINE AND MILL SUPPLIES,**

**Chemicals and Chemical Apparatus.**

Sole Agents for the Pacific Coast for the W. S TYLER WIRE WORKS CO., manufacturers of

**Steel and Brass Wire Battery Screens.**

We frequently have Second-Hand Assay Balances, which we put in order and sell at reduced prices.

We now have on hand One Becker's No. 5 Scales, list price, $95, which we will sell for $65; One Becker's Pulp Scale, list price, $22, sell for $16; One Becker's Analytical Balance, with agate knives, list price, $95, will sell for $60. One Oertling's Assay Balance, price new, $175, sell for $125. All the above scales are in good order.

## Great Reduction in Light!

## IMPERIAL Automatic Gas Machine

**Produces a Beautiful Light.**

The difference between the brilliancy of light produced from gasoline gas and from coal gas is 3 to 1. The gasoline light is clear and soft, rests the eyes and brings comfort to the home.

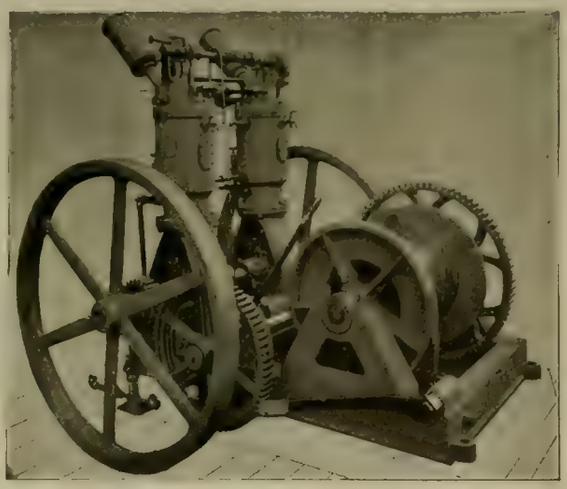
The latest and most perfect Automatic Gas Machine now in use, particularly for illuminating private dwellings in the country, as well as residences in the suburbs of a city or town, public institutions, asylums, hotels, etc. The light is steady, soft, bright and pleasant to the eyes and can be furnished at an expense of but eighty cents per 1000 feet of gas. It is much safer than coal oil lamps, which are so dangerous to have in the house on account of an explosion.

These Gas Machines are perfectly safe, and free from any danger whatsoever. Every modern house built for gas should have one of these machines. No public institution should be without one. I have no hesitancy in saying that there is no other gas machine in the market that can compete with mine as to prices, and they surpass as to perfection in all its requirements.

For supplying gas for gas stoves for cooking or heating these gas machines have no equal. Address

JACOB SCHRIEBER,
East Berkeley, Cal.
Or H. E. STEMLER, Agent, Merced, Cal.

## DEWEY & CO'S Patent Agency.



OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. patents since 1872. All worthy inventions patented through Dewey & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior.

Advice and Circulars free.

# Golden Gate

GAS  ENGINE

## WITH MINE HOIST CONNECTED.

These Hoists are now in use on several mines and have proved practical, safe and economical. Starts and stops with ease. Speed under perfect control.

The entire plant, engine and hoist, is light and compact. Can readily be placed in any position, on the surface or underground.

**Capacity from 4 to 50 H. P.**

The "Golden Gate" uses Gas or Gasoline; it is the simplest and most reliable engine built. It furnishes power wherever required at the lowest cost.

Send for circulars with full particulars.

**ADAM SCHILLING & SONS, Manufacturers,**
211-214 MAIN STREET.....SAN FRANCISCO, CAL.

# Market Reports.

## The Markets.

SAN FRANCISCO, April 9, 1896.

Jobbers report an improved demand for all kinds of goods, but the buying is still in small quantities which goes to show a lack of confidence. The only exception to this rule is gold mining districts and lumbering camps, which take more goods than at the corresponding time for several years. In this State about all the old mining towns have received quite an impetus by reason of the renewed interest in mining. At several of these places vacant houses are now the exception, whereas three years ago they were the rule. For hardware and various kinds of machinery a good demand is reported. Foundrymen and ironworkers in general state that general business with them shows an increase over last year. The efforts that are being made at the East to maintain recent advances in iron and steel cause a strong market with us for the finished products in these lines.

In the local money market the banks report a plethora of funds. Notwithstanding this they continue to discriminate in loans, although signs point to more leniency in the near future, provided grain crop prospects continue favorable. In the southern counties of the State there is urgent need of rains to bring the crops to maturity on unirrigated lands, but in from Merced north the ground is wet to a sufficient depth to last for some time. Collections are said to be only fair, but this is largely offset by retail dealers owing less money. From the East our advices state that there is more or less stringency in the money markets, but this is expected to be relieved before long. At New York foreign money is offering which is having a favorable effect there. Sterling exchange is strong at the recent advances.

**New York Silver Prices.**

NEW YORK, April 9.—Following are the closing prices for the week:

| | Silver in London. | N. Y. | Copper. | Lead. |
|---|---|---|---|---|
| Friday | | | | |
| Saturday | 31⅛ | 68 | 10 75 | 3 05 |
| Monday | | 68 | 10 75 | 3 05 |
| Tuesday | 31⅛ | 68⅛ | 10 75 | 3 07½ |
| Wednesday | 31 3-16 | 68¼ | 10 75 | 3 07½ |
| Thursday | 31 3-16 | 68¼ | 10 75 | 3 07½ |

The local bullion, money and exchange quotations current are as follows:

| | |
|---|---|
| Commercial Loans, % per annum | 7@8 |
| Commercial Loans, prime | 6@8 |
| Call Loans, gilt edged | 7@8 |
| Call Loans, mixed securities | 7@8 |
| Mortgages, prime, taxes paid by lender | 6@8 |
| New York Sight Draft | par |
| New York Telegraphic Transfer | par |
| London Bankers' 60 days | $4.88 |
| London Merchants | $4.86 |
| London Sight Bankers | $4.89½ |
| Refined Silver, per oz., 1000 fine | 68¼c |
| Mexican Dollars | 55@56c |

SILVER.—The market has been dull throughout the week. The demand for both Japan and China is light but an improvement is looked for soon—when the new-season tea business opens. The East reports a moderate inquiry with the exports light for the time of the year. From London our advices are practically unchanged. The stock available there is said to be ample to meet present requirements, but when new-season tea begins to move a better demand is expected to rule from both China and India.

MEXICAN DOLLARS.—The market continues to rule steady. The demand is confined to small quantities, but the wants of importers from the Orient are expected to steadily increase. Dealers quote 55 to 56 cents, according to quantity wanted by buyers.

COPPER.—The impression prevails that the market will do better. This opinion is grounded on eastern advices that there is a large export movement to Europe, where the consumption steadily increases. New York mail advices to April 4th state lake copper is hard to get under 11 cents. Referring to this a leading exchange at that city says: Some significance may be attached to the statement appearing in the circular of a prominent broker that information has been received "direct from the Lake that several carloads of ingot copper every day have lately been shipped from these smelting works by all-rail to meet the urgent demand for foreign account," and that "the amount of copper now at the Hancock smelting works is not so much as it was a year ago." Other varieties are also in quite good demand, and prices are steady to firm at 10⅝@10¾c for electrolytic and 10⅜@10½c for casting stock.

The market is quoted as follows:

| | |
|---|---|
| Bolt, ¼ & 5-16, 20c; ⅜ and larger | 17c |
| Lake Superior Sheathing | 20 |
| Ingot, jobbing | 13 |
| Ingot, wholesale | 12 |
| Sheet copper | 17 |

LEAD.—The market seems to have a steadier tone in sympathy with Eastern advices. The demand there seems to be somewhat improving, but buyers do not appear to anticipate their wants.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Pig | 3 75 | @ | 4 00 |
| Bar | — | @ | 4 15 |
| Sheet | — | @ | 5 50 |
| Pipe | — | @ | 4 75 |

SHOT.—So far as we can learn there is nothing new to report.

The market is quoted as follows:

| | |
|---|---|
| Drop, sizes smaller than B, per bag of 25 lbs | $1 40 |
| Drop, B and larger sizes, " " | 1 65 |
| Buck, Balls and Chilled, do, " " | 1 65 |

QTICKSILVER.—The steamer for Guaymas took out 145 flasks. The call from mining districts on this coast shows a slight improvement.

The market is quoted as follows:

| | |
|---|---|
| Home trade, per flask | 39 00 |
| West Coast of Mexico, for Export | 34 00 |

POWDER —The demand is said to show an improvement over that ruling at the corresponding time last year. The recent advances in glycerine, aggregating fully 100 per cent, cause a strong market. At present prices manufacturers barely come out even.

The market is quoted as follows:

| | |
|---|---|
| Hercules, No. 1, per pound | 11½c |
| " No. 2, " " | 8½c |

BORAX.—The shipments eastward continue free so as to meet the improved demand.

The market is quoted as follows:

| | |
|---|---|
| Refined, in car lots | 6½ |
| Refined, in sacks | 5¾ |
| Powdered, in car lots | 6⅛ |
| Concentrated, " | 5⅝ |

TIN.—The market is inactive, with canners taking only sufficient to meet current wants. At the East the market is reported unchanged, with no signs of any speculative movement.

The market is quoted as follows:

| | |
|---|---|
| Pig, per lb | 14½c |
| Plate, I C coke, heavy, per box | $4 25 |
| " " " light, " | 4 10 |

ANTIMONY.—The market is steady at 9 cents as an outside figure. New York mail advices quote 7⅞@8c for Cookson's, 6⅞ for Hallett's and 6¾c for Japanese, from store.

COAL.—Several vessels arrived the past week with Australia coal. The tonnage on the way and looking at Australian ports for this city aggregate 63,503 registered tons. From Japan our advices are to the effect that the Japan Mail Steamship Co. are putting a line of six steamships to run between Japan and European ports. The outward cargoes will consist chiefly of Japan coal. In our market there is nothing new to report. Considerable cutting in prices is reported, which make quotations largely nominal.

COKE.—The market is quoted as follows:

| | | | |
|---|---|---|---|
| Gas Companies' | — — | | — — |
| English, to load | 9 00 | @ | 10 00 |
| " spot, in bulk | — — | @ | 8 50 |
| " in sacks | — — | @ | 9 50 |
| Cumberland | — — | @ | — — |

LUMBER.—Advices from up north continue to report large export shipments. In this city the demand is said to show an increase over that ruling at the corresponding time last year.

The market is quoted in this city from dock or yards as follows:

| | | | |
|---|---|---|---|
| Redwood, Fluming | 16 00 | @ | — — |
| Pine | 13 00 | @ | 18 00 |
| Spruce | 25 00 | @ | 30 00 |

NAILS.—Jobbers continue to report a good demand, with the market firm for all kinds.

The market is quoted as follows:

| | | | |
|---|---|---|---|
| Wire, carloads, basis per keg | $3 07½ | | |
| " jobbing, " " | 3 20 | | |
| Cut, carloads, " " | 2 82½ | | |
| " jobbing, " " | 2 95 | | |

IRON.—The consumption in this city is said to be fair, as it is up North. Our market does not seem to respond to the recent move at the East to advance values. Referring to this movement the New York *Journal of Commerce* says: "The New York market for pig iron responds very little, if at all, to the efforts that have been made latterly at some prominent trade centers in the direction of carrying prices higher. In any event business moves along at very ordinary pace, and little difficulty is experienced in obtaining standard brands at the average prices that have ruled for a week past." Some shipments have been made of Southern iron to Europe, but it seems as if this was done more for the purpose of reducing stocks at the South. A recent Eastern exchange says: "It may be advantageous to work off an uncomfortable surplus by slaughtering distant markets. It might well suit the recently-born combination of Birmingham furnace companies to get rid of a heavy load in that way. But that is far from a systematic and sustained competition against English makers in their own or in neutral markets. We confess that we expect the time to come when our export of pig iron will be a regular business, and that it will be lucrative. But it would be misleading to assert that we have reached that point yet."

## Mining Share Market.

SAN FRANCISCO, April 9, 1896.

The market was weak and heavy on Friday, but towards Saturday noon Hale & Norcross exhibited unexpected activity, causing an advance in the price of the shares. The improved demand for it was due to authentic advices that work would be resumed in the mine. On Monday the market opened at still higher prices for Hale & Norcross. The top figure at which it sold was $1.45 a share, against $1.20 on regular call Saturday. In this advance the rest of the market sympathized slightly, causing Con. Virginia and Belcher to carry their assessments. In the afternoon of Monday the bears commenced hammering Hale & Norcross, and as the price sat off, they started in on Con. Virginia, Sierra Nevada and Union. Under their selling the market went off. Tuesday it was still weaker, with outsiders selling their long shares, while a few sold short. The bulls tried to stand under Hale & Norcross, owing to advices that work in the mine would be commenced the next day, but their support was only temporary, for with a steady raising of the north end shares and Ophir giving way, Hale & Norcross sold at $1.25. Yesterday morning the market opened weak along the entire line, and as the forenoon passed shares in the Gold Hill mines, as also those in the north end, shaded off still more. In the afternoon the market had a steadier tone, notwithstanding heavy sales by a plunger of shares in three or four of the mines. There can be no doubt that at the declining prices outside holders sold quite freely, and when this occurs it is only a question of a short time before the market rallies, particularly if there is quite a line of assessments to collect, for the small pools were never known to pay the latter when they could unload on the public, and to do this a higher and a more active market becomes a necessity.

It looks now as if the Hale & Norcross affairs have been arranged so there will be no further trouble about working the mine. This has been done by appointing a general manager at Virginia. This move, and also the appointing of an assistant secretary of the company in this city, creates the impression that the reformers have accepted the inevitable, and therefore the expenses are not cut down much. If the new management should succeed in finding ore and make the shares sell higher, it is thought that no one will seriously object to the change in the programme.

Since writing the above a report is current that owing to the Hale & Norcross shaft having swollen they could not get the cage down, which prevented the miners going down to work. The shaft will have to be repaired before active work can be resumed in the mine.

The contest for the control of the Bulwer mine, in the Bodie district, resulted in the contestants voting a majority of the shares, but the old management took "snap judgment" by retaining possession of the company's books and office at this city. This action will precipitate a lawsuit and bring up one or two points for decision by the courts, and in the meantime two boards of officers will claim control. This is considered unfortunate, but it may result in good in the end.

The news from the Comstock mines continue to report a fair degree of active work in Alta, but as no ore has been found an assessment is inevitable. In the Gold Hill group our advices state that work is being done in Caledonia. In Overman the work, so far as publicly given out, is practically unchanged since our last review. A few tons of fair grade ore is being raised. In Seg. Belcher and Belcher no change is reported in the character of the work. The latter company milled the past week over 300 tons of ore, the battery assays of which go a little over $23 a ton. In Crown Point the work seems to be shaping for more active exploiting before long. In prosecuting the work some low grade ore has been found, but unless it increases very much in value it will not cut any figure for the market value of the shares. From Yellow Jacket it is almost an impossibility of getting information regarding work in the mine. The joint west drift that is being run by Confidence, Challenge and Con. Imperial is in over 475 feet. Unless the west lode for which they are running diverges to the west they ought to be near that lode. In Alpha the work is essentially unchanged as is that in Bullion. In the middle group they are doing considerable work in Potosi, Chollar and Savage. Some ore is raised but the quantity is not large enough to attract attention while the assays are only fair. Some look for better things in one of these mines within the next few weeks. What this opinion is based on it is difficult to say. It may be that the wish is father to the thought. In Hale & Norcross work has been resumed. From all that can be learned it is the intention to explore the ground between the 900-foot and 750-foot levels. It is claimed that there is some ore there unless it has been extracted by the old management. This company has arranged to mill about 500 tons of ore now on the dumps. The long west drift in Gould & Curry is still being carried forward. In Best & Belcher a fair degree of active work is being done, but an impending assessment is against the market value of the shares. Official letters from Con. Virginia report continued active work on several levels, but with no improvements in the mine. Last week's advices gave more tons raised and a slight increase in the assay value. In Ophir some low grade ore continues to be found. The work is on the same levels heretofore reported. From Mexican nothing new is reported. The work does not attract but an impeding assessment does. The work in Sierra Nevada and also that in Union has failed to strike ore going above $3 or $4 a ton, but the work is being pushed ahead in the hopes of finding something of value. The work in Utah is of the same character as that heretofore reported, as is that being done in Andes.

On the Brunswick lode attention continues to be centered on the work in Occidental. It is stated that ore has been found the past week, but its extent and value seems to be unknown so far as the public is concerned. The management seems to be well pleased with the prospects. The work done by the other companies on this lode indicates that they have either commenced or else are about ready to commence drifting for the lode. It would seem from our advices that this work ought to attract more attention before long.

From the Bodie district the same old stereotyped letters come to hand from Bodie. They continue to report low-grade ore. From Bullion and Standard the official letters are about as heretofore received in this city.

| San Diego | ..... | 5.68 | 11.90 | 5.73 | 74 | 48 |
| Yuma | ..... | .88 | 3.01 | 2.08 | 88 | 46 |

* Indicates no record.

## Recent Mining Dividends.

THE Le Roi Mining and Smelting Company last Tuesday declared a $25,000 dividend, making a total of $125,000.

THE Quincy Copper Mining Co. of Michigan paid a dividend of $4 per share yesterday.

## KENDALL GOLD AND SILVER
EXTRACTION CO.

The Kendall Process is the most efficient method of using cyanide for the extraction of precious metals from their ores. Wherever this process has been adopted the result has been increased percentages of values recovered and saving of time. Material reduction in consumption of chemical has also been demonstrated with respect to several classes of ores.

*The Kendall system is covered by patents which this company will defend.*

The American Cyanide Gold and Silver Recovery Co., organized in Denver more than a year ago to introduce and operate the Kendall Process in several States, have closed contracts with some ten mines for the use of this process after exhaustive comparative tests with the ordinary plain cyanide method.

Capt. De Lamar has adopted the process at his Nevada mines, where a 250-ton plant is being completed. He writes that he is saving 95 per cent of his gold values, and regards the Kendall Process as the cheapest and best he is aware of for the treatment of gold ores.

*All ores, without exception, amenable to cyanide treatment can be treated to better advantage by the Kendall Process. This can be accepted as an axiom.*

Owners of mines and reduction works can obtain full information on application to

And in accordance with law, and an order from the Board of Directors, made on the 10th day of February, 1896, so many shares of each parcel of such stock as may be necessary will be sold at public auction at the office of the Company, Nos. 37 and 38 Crocker Building, San Francisco, California, on FRIDAY, the 10th day of April, 1896, at the hour of 2 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

E. C. GODFREY, Secretary.

Office, 37 and 38 Crocker Building, San Francisco, California.

## Assessment Notices.

GOULD & CURRY SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia, Storey county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees held on the twenty-fifth day of March, 1896, an assessment (No. 78) of Fifteen cents (15c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-eighth (28th) day of April, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with the cost of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 69, Nevada Block, No. 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY. Location of principal place of business, San Francisco, California. Location of works, Fairfax, Marin county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 6th day of March, 1896, an assessment (No. 5) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 76, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 13th day of April, 1896, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 4th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office, Room No. 76, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 2d day of April, 1896, an assessment (No. 22) of ten cents (10c) per share was levied upon the whole of the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of May, 1896, will be delinquent and advertised for sale at public auction; and unless payment is made before will be sold on THURSDAY, the 28th day of May, 1896, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

CHALLENGE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Gold Hill, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 27th day of March, 1896, an assessment (No. 21) of Five Cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of April, 1896, will be delinquent and advertised for sale at public auction, and, unless payment is made before, will be sold on WEDNESDAY, the 20th day of May, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors

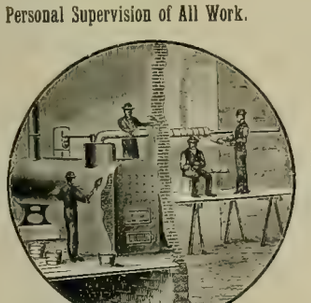
C. L. McCOY, Secretary.

Office—Room 35, third floor Mills Building, corner Bush and Montgomery streets, San Francisco, California.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California. Location of Works, Inyo, Inyo county, California.

Notice is hereby given, that at a meeting of the Board of Directors held on the 30th day of March, 1896, an assessment (No. 28) of ten (10c) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, Room 323, Phelan Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 4th day of May, 1896, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 4th day of June, 1896, to pay the delinquent assessment, together with costs of advertising and expenses of sale.



M. A. CAHN, Secretary.

Office, Room 323, 5th Floor, Phelan Building, San Francisco, California.

# THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

**MINING AND SCIENTIFIC PRESS,**
220 Market Street, San Francisco, Cal.

*Assaying.—Part I—Gold and Silver Ores.*
Second edition. By C. H. Aaron. Embraces 130 12-mo pages, with illustrations, well bound in cloth; 1889. Price, postpaid.....$1 00

*Assaying.—Parts II and III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.*
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

*Notes on Assaying and Assay Schemes.*
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

*Prospector's Field Book and Guide.*
By H. S. Orborn.....$1 50

*A Practical Guide for Prospectors and Miners*
By C. W. Moore. With numerous illustrations.....$4 75

*The Explorer's and Assayers' Companion.*
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

*Aaron's Leaching Gold and Silver Ores.*
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

*Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.*
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, postpaid.....$3 00

*The Lixiviation of Silver Ores with Hyposulphite Solutions.*
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Dr. R. W. Raymond, in reviewing the book, says: "Mr. Stetefeldt's book is a model of terseness and clearness. * * * His contribution to the literature of the subject takes its place among the valuable professional treatises which have, in recent years, reflected honor upon American metallurgists."

*Modern Copper Smelting.*
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and greatly enlarged. The standard authority of the world in Copper Smelting. Profusely illustrated.....$5 00

*The Metallurgy of Gold.*
By M. Eissler. Profusely illustrated.....$5 00

*Losses in Gold Amalgamation.*
By W. McDermott and P. W. Duffield.....$2 00

*Electricity in Mining.*
By Sylvanus P. Thompson.....80 cts.

*Practical Treatise on Hydraulic Mining.*
By Aug. J. Bowie, Jr. This new and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc A very practical work for gold miners and users of water. Price, postpaid.....$5 00

*Practical Hydraulics.*
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

*Hydraulic Gold Miner's Manual.*
By T. S. G. Kirkpatrick. With plates and cuts.....$2 25

*Manual of Hydraulic Mining for the Use of the Practical Miner.*
By T. E. Van Wagenan.....$1 00

*The Sampling and Measurement of Ore Bodies in Mine Examinations.*
Well printed on fine paper, with plates; complete. Price, postpaid.....25 cts.

*Manual of Mining.*
For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Ihlseng, E. M., Ph. D. Second edition, with Appendix. 500 pages, 8vo., cloth.....$4 00

*A Text Book of Mineralogy.*
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

*Manual of Determinative Mineralogy.*
With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

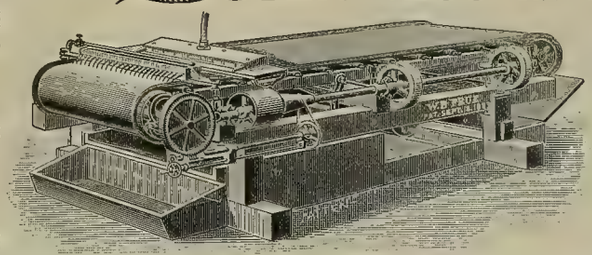
*Metallurgy of Silver, Gold and Mercury in the United States.*
Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 50

*Metallurgy of Silver, Gold and Mercury—Continued.*
Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

*Notes on the Treatment of Gold Ores.*
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

*A Practical Manual of Minerals, Mines and Mining.*
By H. S. Osborn.....$4 50

*Matte Smelting—Its Principles and Later Developments, with an Account of the Pyritic Processes.*
By Herbert Lang.....$2 00



*Cyanide Processes for Gold and Silver Ores.*
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

# FRUE ORE CONCENTRATOR.

## OVER 4200 IN ACTUAL USE.

Manufactured under Patents of

April 27, 1880;
September 18, 1883;
July 24, 1888;
March 31, 1891.
July 18, 1893.

It can be safely stated, without going into a description of several new and untried concentrators that have lately come into the market, that where sulphurets are of such value as to make close saving necessary, the Frue Vanner is always used. It is the only endless belt concentrator in the market that can be relied on to handle all classes of ores, and give universal satisfaction. (In all competition of concentrators the Frue Vanner is taken as the standard machine of the world, and all comparisons made by it. There have been over 4200 of these machines sold, 1700 having been sold on the Pacific coast alone.) They are in use in every part of the world where mining is carried on and in all cases they are giving perfect satisfaction. From time to time valuable and important improvements have been made in this machine to increase its capacity and durability, and particular attention is called to the Patent Lip Flange for the rubber belt, which does away with nearly all the strain and cracking, as in the old style of flange, making the life of belt more than double that of other style belts in the market. The lip of flange bends outward in going over the large end rolls, thereby distributing the strain in the solid rubber, and bringing virtually no strain either at the edge or at the base of flange, as is the case in all belts with a raised edge.

For any information, pamphlets, circulars or testimonials, call on or address

Price of 4-foot wide Plain Frue Vanner ..... $500, f. o. b.
" " " Improved Belt Frue Vanner..... 600, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 600, f. o. b.

JAS. S. BROWNELL, Western Agent FRUE VANNING MACHINE CO.
(Successor to ADAMS & CARTER). 132 Market St., Room 15, San Francisco.

# RISDON IRON WORKS,

SAN FRANCISCO, CAL.

## READ WHAT MINERS THINK OF THE BRYAN IMPROVED ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each crush through 60-mesh screens 12 tons in 24 hours; through 50-mesh, 15 tons; and through 40 mesh, 18 tons. This proportion has been continuous.

One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.

The mills require very little attention. At our mill an ordinary peon," earning one dollar per day, has complete charge.

In regard to silming, in comparison with stamps, by reason of the discharge surface and the continuous agitation by the scrapers, a MUCH less amount of slime is created. A three years' experience teaches me that, in every respect, the mills are a complete success, and of material benefit to the mining world. They can be set up and running in forty-eight hours and can be dismounted in the same time and removed to wherever desired. Ours were packed on our mule trail over as difficult a road as any in Mexico. As a gold amalgamator it is unequaled by any mill now in existence. Yours truly,

D. M. BURNS, Superintendent.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz., capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK. Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly,

JOHN BECK. Pres.
SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly.

[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year.

CHAS. C. MCIVER, President.

## A California Electric Mining Plant.

An interesting plant for the generation and transmission of power is about to be installed by the Mammoth Bar Gold Mining Co. at a point on the Middle Fork of the North Fork of the American river, nine miles from Auburn, Placer county, Cal. It consists of a 300 H. P. 30-inch special Girard water wheel, coupled direct to a 150 H. P. 1000-volt direct current generator, and provided with a pulley for driving a similar generator, when it becomes desirable to increase the capacity of the plant.

The mining operations consist in sluicing the gravel from the bed of the river. At Mammoth Bar the river spreads out to about 1000 feet in width, and in summer the water is shallow enough to allow of diversion by means of rock and brush dams. This is done as soon as the water goes down in the spring, and work is carried on day and night until the autumn floods set in. The gravel is extracted down to bedrock and raised to the sluices by a hydraulic elevator, one or two monitors being used to wash the grave. down to the sump. For these purposes water is taken from the ditch of the California Ditch Co. at an elevation of about 1500 feet above the mine, run down a canyon and piped at a point which gives a fall of 400 feet. A 7-inch throat is used in the elevator, and it has been found that it will handle all the gravel that can well be supplied to it, but that it cannot raise the quantity of water necessary to wash down the gravel. Pumping was resorted to; the pump was placed in the pit and driven by a water wheel from above. This entailed so much additional expense for water that it was decided to put in a power transmission plant to generate power at the head of the old pipe line and transmit it electrically to the mine, a distance of more than half a mile. Accordingly, a pipe was put in and the water taken from the canyon farther up, thus using the same water twice and obtaining about 300 H. P. before the water entered the old pipe. Part of this is transmitted to the mine and used for pumping and lighting, while the surplus is available for any demand that may be made upon it.

GIRARD WATER WHEEL AND 150 H. P. GENERATOR.

In accordance with these plans, an order was placed with the Electrical Engineering Co. and the Girard Water Wheel Co. of San Francisco for the necessary machinery, to consist of water wheel, generator, switchboard, motor and accessories.

The cut shows the wheel and one of the 150 H. P. generators. The wheel is 30 inches in diameter and will develop 300 H. P. under a head of 400 feet, at a speed of 560 revolutions per minute. A short section of pipe, put on with an angle flange, may be removed to clear the nozzle of any obstruction which may get into the pipe. The large pulley shown serves as a cover for the governor and to drive the second 150 H. P. generator, while the small pulley runs the separate exciter. The governor is the S. & V. Inertia, which indicates load changes by moving a balanced valve, the actual work of operating the nozzles being done by the hydraulic cylinders shown near the back-bearing. These are contracting nozzles, which are simple and durable, and which limit the amount of water used in proportion to the work being done. This results in a great economy when the load varies.

All bearings are self-oiling and self-adjusting. The generator is of the direct-current, bi-polar type, wound for 1000 volts, with separately excited fields; it is connected to the wheel by a heavy insulating coupling.

Both machines are mounted on heavy steel I-beams, which are imbedded in concrete. The power house is situated near the head of the pipe line supplying water to the monitors and elevator, and the tail water from the wheel is used a second time.

From the power house the pole line runs down the hill to the mine where the shunt-wound motor driving the pump is placed on a temporary wooden foundation. The centrifugal pump is located in the pit and is driven by means of a belt carried on idler pulleys. The motor is placed above, so as to be free from the danger of a sudden rise of water from any cause. The mine will be lighted by clusters of lamps hung on wires stretched above on poles.

---

H. K. Thurber is a good example of how a clever man will change his opinions with a clearer conception of facts. But recently he was a merchant prince of New York, with the usual monometallic ideas of that most provincial of all American cities. Now he is a resident of Idaho, and contributes to the Hailey *Times* excellent articles on the necessity for the remonetization of silver. He has as much money as when in New York, and has the additional advantage of possessing the ability to admit his mistake and state his reasons for the faith that is in him.

---

The lists published in New York and elsewhere of dividend-paying mines in California are misleading, making meager showing alongside similar lists from other States where it is the fashion or custom to incorporate. Counties like Calaveras that turn out over $2,000,000 per annum are unrepresented. It is not generally understood that California gold mines, as a rule, are private, unincorporated concerns; and even of the comparative few that are incorporated, most of these make no formal declaration of dividend, but divide the profits pro rata. It is part of the non-advertising character of the gold mining industry of this State, the owners being content to have their property pay well without broadcast announcement of the fact. When, however, comparative lists of dividend-paying mines in different States is made up, it makes a poor showing for California though. The truth is that in no place on earth is gold mining of more present profit, and in no other section is the individual gold seeker so well off as in this favored land of California.

---

Recent mining disasters in Montana emphasize the need of the enforcement of mining legislation as well as the necessity for constant personal vigilance. On the surface, generally, a man can look out for himself: underground, he largely has to depend for safety not only on his own precaution, but upon the care and prudence of his associates. The horror at the Hope mine, Basin, Montana, where a mine with a shaft 300 feet deep and extensive workings had but one outlet, resulting in seven poor fellows being roasted alive, calls for the enforcement of legislation in that State making a recurrence of such a tragedy impossible so far as law can prevent.

---

The man or men who want to hold all the claims in sight even without doing the requisite $100 worth of annual work or improvements will be given a close rub this year. Too many claims are held by those who, whether unwilling or unable, do nothing but hang on from year to year, some of them looking for the purchaser who never comes, and never will come till something more than a mere "prospect" can be shown.

# MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

*Office, No. 220 Market Street, Northeast Corner Front, San Francisco*
*Take the Elevator, No. 12 Front Street.*

ANNUAL SUBSCRIPTION:

United States, Mexico and Canada..... $3 00

Entered at the S. F. Postoffice as second-class mail matter.

J. F. HALLORAN.....General Manager

San Francisco, April 18, 1896.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Girard Water Wheel and 150 H. P. Generator, 313. Cazin Improved Crushing Rolls, 317.

EDITORIAL.—A California Electric Mining Plant; How a Clever Man Will Change His Opinions With a Clearer Conception of Facts; Misleading Lists of Dividend Paying Mines in California; Recent Mining Disasters in Montana; A Close Rub, 313. California Will Be the Leader, 314.

ELECTRICAL PROGRESS.—Chlorination vs. Cyanide; German Electrical Terms; An Electrical Orchestra; Interruption of a Telephonic Conversation; Decision of Acting Secretary of the Interior Reynolds; Cost of Alameda's Electric Light Plant; Photographing Flames of Explosives; Victoria Electric Railway Sold; Electric Tramway at North Star Mine, B. C.; Electric Railway in Yellowstone Park; The S. F. & S. M. R. R. Sold, 318.

SCIENTIFIC PROGRESS.—New Process for Producing Alumina from Clay; Protection of Iron and Steel from Rust; Galvanizing Aluminum with Metals; Experimental Results with the Mobility of Metals; The Five Problems of Artificial Flight; Expedition to Observe the Eclipse in Japan; Alcohol from Acetylene, 318.

MECHANICAL PROGRESS.—H. Y. Castner's Inventions; Roentgen Rays and the Eyesight, 318. New Process for Manufacturing Chlorate of Potash; Silver Mirrors; An Alloy to Replace Gold; Cementation of Steel, 319.

PRACTICAL INFORMATION.—Manner of Packing an Important Matter; Lithium; Seems Anomalous; Acetylene Gas; Experiments with a Ball of Solid Iron; The Miner's Inch; "Profit Sharing," 320.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 322-3.

THE MARKETS.—Eastern and Local Metal Markets; Coal and Coke; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 330.

MISCELLANEOUS.—Concentrates, 315. Lixiviation of Silver Ores in Mexico; The Adventures of a Mining Item; A Paraphrase of an Old Saying; Lead Statistics for 1895; Ice in the Low Latitudes of Cape Horn and Falkland Islands; A Crude Mineral Product; The Equivalent of an Inch of Rain, 316. Assays of Copper and Copper Matte; Improved Cornish Crushing Rolls, 317. The Real and the Unreal Business Paper, 319. Notices of Recent Patents; H. F. Brown's System of Mechanical Roasting Furnaces, 321. Coast Industrial Notes; Personal; Recent California Mining Incorporations; Recent Mining Dividends; Commercial Paragraphs, 324. Temperature and Rainfall, 330.

## California Will Be the Leader.

Of all California industries, gold mining under present conditions promises most profit. It is the industry the development of which should at this time most largely engage the attention of the people of the State. Gold mining should now again be given its old place as the leading California industry. The fact that the whole world is being explored and ransacked in search of the yellow metal shows that the time is now ripe for a revival of gold mining in California. For years some mines have been permitted to lie fallow, while industries in other lines were being pushed, but the time has now arrived when mining should again be brought to the front. With all her auriferous deposits developed, California will soon lead all the mining regions of the world in gold production.

There is nothing surer than this, and every Californian should do all he can to fill the mountains with miners and prospectors in order that the hidden wealth of the State may be brought to light and utilized. It is to the interest of farmers, merchants, manufacturers, and men in every line of business, as things now stand, to do all in their power for the development of the mining resources of the State. By lending their assistance in the opening of the mines men in other lines of business will not only have a chance to get a hold in good mining properties but will also get their share of the money expended for the supplies of all kinds that will be required in every camp in the mountains. Thus they will not only develop their mines, but will also keep their money in the country where it will come back to them. The industry of mining the precious metals is the mother of all the industries. It furnishes the "sinews of war" for all kinds of enterprises. It is the rival of no other industry, but on the contrary is the promoter of all others. The greater the success in it, the greater the prosperity in all the other industries. As all will admit, the majority of the ordinary industries of California are suffering an almost distressing degree of depression. They have got into a rut, out of which they are at present powerless to rise. In themselves the industries are helpless; they have gone as far as they can go. What they need and must have is the stimulus of a big revival in mining, and a largely increased output of the golden stores of the mountains; therefore, it is evident that, for their own good, the people should push mining to the front and keep it at the head of all the other industries, where it properly belongs. As mining flourishes so will flourish all else, for it furnishes the motive power for all else.

On page 322 appears a detailed exhibit of the gold yield by counties of this State for 1895, as furnished from official tabulation by Mr. Chas. G. Yale, statistician at the U. S. Mint in this city. The aggregate of $15,334,317.69 could be doubled. Conditions permit of it. California is the only State and gold mining is the only industry of which such a statement can truthfully be made. Ordinary business rules of supply and demand, of competition and marketing, do not apply in this case. The buyer seeks the seller; the price is fixed, the terms are cash; there is no overplus, the freight charges are minimum. The usual handicaps in California to the business of production are absent.

Californians who wish to try their luck at mining can nowhere find a better field in which to operate than in their own State, along the mother lode and in the numerous systems of fertile quartz veins outside of that great central gold-bearing belt. No better place can be found in which to put money into mines, whether in Colorado, Utah, South Africa, Australia or South America, than is to be found in their own State, and almost at their own doors. In fact, many men of capital from Utah, Colorado, and other mining States, and from the Atlantic States and Europe are now eagerly investing in the mines of California. This being the case, Californians would not be likely to better themselves by going abroad in search of mining properties.

In the California mining field are also found advantages of which no other gold region can boast. The mines of California are in the midst of civilization; they are near to the markets where all kinds of supplies may be cheaply obtained; there are at hand whole forests of the best of timber, and many rivers, creeks and canyons afford power for water mills and for electrical plants, while the climate is the finest in the world. It is a region in which there are no longer any hardships to be endured; indeed, the mountains about and above the mines are popular places of resort in summer for people from the towns of the agricultural valleys.

Contrast this mining region with the worthless wastes of West Australia, the wilds of South Africa, the ice fields of Alaska, the snows and storms of British Columbia, or even with the less frigid Pacific Coast States of the arid sections between the Sierras and the Rockies. We find California the paradise of mining countries. Indeed, in many places semi-tropical fruits are grown in the midst of the mines, flowers bloom in the gardens in January and it is "summer all winter." But, best and most important, right here in this region are found the best and richest gold mines yet discovered in any place in the world. And these mines are just beginning to be worked in a really systematic and scientific manner. Rich finds have been made here and there in years past in the big gold belt and fortunes have been made by mere working with crude machinery and inefficient appliances, but the great bulk of the gold of the California mines remains to be extracted, even in the veins best known and most worked. Then there are thousands of veins, great and small, yet to be discovered. For many years to come rich finds will continue to be made, for in many places quartz veins are hidden beneath such a depth of surface soil that they will only be discovered through accident or by expert prospectors carefully searching for them.

Californians know and recognize the truth of all this, but it is not known nor understood elsewhere as generally as it should be. Letters of inquiry daily received in this office show that there is considerable incredulity as to the existence of so much unmined gold in this State. A good many non-residents seem to imagine that the $1,269,115,604 officially accounted for, besides as much more unrecorded gold mined in this State from 1849 to Jan. 1st, 1896, has depleted the source of so much wealth, when, as a matter of fact, that enormous amount is but an index of the amount yet remaining. Much of that sum was secured by rude and wasteful methods. To-day scientific mining is nowhere receiving greater practical attention than in this State.

It is not generally understood that every kind of gold mining is followed here; the three principal kinds are quartz, drift and gravel, the two latter being hydraulic methods, though in some cases drift mining is prosecuted through shafts. The remarks in this article may apply mainly to California quartz mines, yet there is more gold to be yet won by hydraulic methods in California than has hitherto been taken out. From '80 to '93 California hydraulic mining was a suppressed industry in a large part of the State, and during the last three years has only been permitted under pains and penalties for non-compliance with State and Federal restrictions, the nature of which are not combatted and do not need present discussion.

The people of California should take hold of the mines and open and work them for the pay that can be got out of them, not as a basis for the issuance of stocks to be peddled out through the country or knocked about in the markets. It is now a very difficult matter to dispose of mining property either in the cities of the Atlantic seaboard or in London or Paris. The people of the East and Europe have become very suspicious of stocks and mines that, with big names and a flourish of trumpets by promoters, are sought to be put upon their markets. They now fight shy of the "big things" that are being hawked about. Over in London they say: "The Americans keep and work their good mines themselves; it is only their wildcats that they bring to us."

Many Eastern people and men from across the sea are now investing in mining properties in this country, but they are going into the mining sections and buying mines that are either paying or are being held and worked on merit. They now deal directly with the owners of mines. Men who have locations on good veins with fair prospects will now be able to sell at fair prices if they wish to do so even if their mines are not already on a paying basis, for there are now purchasers in the field who are willing to take chances either on their own judgment or the judgment of trusted experts. Californians need not fear to put money into any of their mines that have a fair showing of ore or are in belts known to be fertile. The people of Colorado have, through their own enterprise, brought their mines to the front. The people of Utah are also making a big showing, yet in neither State have they the foundation for the grand mining operations and big results that are found in California's great mother-lode gold belt. This is beginning to be seen and acknowledged. Men of capital are now freely investing in properties along the big lode. The people of the East who wish to try their luck in gold mining do not fear to take chances in, or buy outright, a mine in which Californians themselves have confidence, and in the development of which they are working and putting up their money.

In California in the early days hundreds of small companies were formed for the opening and mining of the placers and river bars, each member contributing his labor, and as a rule the plan worked well. Quartz mines might be prospected and worked in much the same way, but with larger companies than those of the placers in the early times. Each member of the company would take as many shares, or as few, as he wished to have in the venture. A small force of good men would then do the prospecting work and the other members would pay the light assessments that would be required. A location on a good vein, with prospects at the surface sufficient to show the ground to be fertile, would have some value at once, and in case of an improvement in the lode this value would increase. In case a man found himself unable to keep up his assessments he would be able to sell his shares at a fair price, for there are always those who are willing to take chances in a vein showing good prospects and situated in a favorable section of any one of the principal gold belts. Once a lot of mines were started in this way by the home people of California, and what they were doing became generally known, plenty of people in the Eastern States would be ready to take a portion of their shares and go in with them, for at present many persons in the East who have money that cannot be profitably invested in any business or industry on the Atlantic side have an itching to try their luck in the gold mines. All they ask is fair and square dealing. They are willing to take such chances as are being taken by our own people.

Also, there are plenty of men in all the other Pacific Coast States who would stand in with the Californians and take shares here and there in the old "Golden State."

People still turn fondly toward the mines of "old California." There are big mines and mining booms at Cripple Creek, Colorado, at Mercur, in Utah, and at other places in the States between the Rockies and the Sierras; still, men of capital from these States are investing in the mines of California. Utah mining men are taking hold of properties. Among the Salt Lakers who have recently become interested are A. N. Butts, Col. Woodrow, E. S. De Golyer, E. T. Wall, F. Enzensperger, W. C. Thomas and W. S. McCormick. All of these men are delighted with the outlook in California and with the properties they have secured.

Instead of getting up a wild boom, locating everything in sight and putting upon the market all manner of wildcats, we of California will do well to put forward no mines except those that have merit, present or prospective. Then the people and the State will derive solid benefit from the mines. A boom in which men would be induced to throw away their money on wildcat locations would soon come to an end; then people would go away cursing the country. Having the best and richest mines in the world, California will soon have an abundance of "boom," and all on solid merit. The very fact that the mines are being opened and worked for what is in them for the money that can be taken out of the ground—not for what can be made by selling the stock, will attract investors among the careful, who otherwise would not put in a cent.

With the present mining outlook, it would not be a bad speculation for men who do not care to put money into mines that are already found and located to send out prospectors. It would cost but little to keep two men and a burro in the field all summer. In San Francisco and other places in California can be found plenty of reliable old prospectors, who would be glad to make such a trip through the mountains. The cost to four or five men joining to send out the prospectors and keep them in "grub" would be but a trifle. It is not difficult to find good, trustworthy men among the prospectors knocking about, waiting for something to turn up, and a pair of them in the field during the summer would be very likely to discover something of value. As they progressed they could very easily send in samples and descriptions of their finds and receive instructions from headquarters. A small army of prospectors might easily be sent forth into the mountains this summer, and, with a little care in the selection, the force would average well as regards honesty and industry. Not a few would consider it a godsend to have a chance to go out on a big prospecting trip.

## Concentrates.

MINERAL PAINT is being shipped from Spenceville, Butte Co., to Chicago.

STATEHOOD for New Mexico and Arizona is among the probabilities of the 54th Congress.

FIFTY stamps are now crushing ore at the mill of the Champion Mining Co., Nevada City.

THE fire in the Hope, Montana, mine is extinguished. The seven imprisoned miners are dead.

THE aggregate capital of the 526 Australasian companies floated in London in '95 was £53,796,394.

THE closing of the Eureka mill, on the Carson river, Nev., throws about fifty men out of employment.

IT is believed that the present number of stamps in operation in this State aggregates a little over 4,000.

THE Merced Mining Co. at Coulterville, Mariposa Co., is going ahead all right, and with satisfactory prospects.

THE Cœur d'Alene, Idaho, Miners' Union has boycotted the Cœur d'Alene *Miner*. The paper has not yet found it out.

THE men who are at present making money in mining in California are more numerous than those making money in anything else.

THE Yuba County Board of Supervisors have adopted a resolution endorsing the $250,000 debris appropriation now before the Senate.

IT takes three days for a loaded steamboat to go from Jennings, Mont., to Fort Steele, B. C., while the return trip can be made in nine hours.

THE California mineral land bill is still before the Senate committee, where Senator Mitchell, of Oregon, is doing his best or worst to defeat it.

O. JACKSON of Prescott, Arizona, states that there are 350 stamps in present operation in Yavapai Co. There are 245 stamps dropping in Pinal Co.

THE Yuma *Sentinel* gives fair notice that it has quit buying out new rival concerns in the publication business, thus discouraging a local industry of long standing.

THE British miners' member of Parliament, B. Pickard, who is also secretary of the Miners' International Federation, is mailing circulars to the United States asking for assistance for the Austrian miners who have been on a strike for several months. The number involved is 32,000, of whom nearly 5000 are women.

A UTAH man has found a borax deposit, but declines to impart to any one the secret of its location. Competition has set the present price of refined borax at 6¼ cents per pound.

IN several States "road improvement" is all the go. When the movement for good roads becomes more prevalent in California, it will be a good thing for the mining industry of the State.

TUOLUMNE COUNTY SUPERVISORS will hurt their county and do miners a serious injustice if they grant the Michigan syndicate the franchise asked for to float logs down the Tuolumne river.

ANOTHER disastrous explosion of giant powder at Butte, Montana, last Saturday, at the St. Lawrence mine, killed six men on the 1100-foot level. The bodies were recovered twenty-four hours after.

AN old idea of this journal, the creating of a new cabinet officer to be called the Secretary of Mines and Mining, is being again agitated. There should be such a cabinet officer, and some day there will be.

REPORTS from the southeastern part of Kern Co., Cal., are to the effect that the more recent gold discoveries there are in quartz. Camp Randsburg, sixty miles east of Mojave, is the center of the new locations.

TO enjoy the benefits of State legislation, Utah mining companies are informed by the Secretary of State it will be necessary in each case to pay him $8, which, under the circumstances, seems reasonably dear.

CALIFORNIA'S mineral product for '92 aggregated $16,000,000 in value; in '93, $18,806,261; in '94, $20,203,294. It is believed the '95 aggregate is about $21,000,000. The gold yield for the State for '95 is reported at $15,334,317.69.

STATISTICS show that the average result of the labor of one man engaged in mining in this State is nearly four times the average result of each man's labor in the business of agriculture and horticulture in the United States.

THE demand from British Columbia for the issue of the 4th inst., containing the illustrated article on the hydraulic gravel elevator, was so great that it is out of print, and the back numbers of that date cannot be supplied.

AN annoying typographical mistake in this column in last week's issue in an item contrasting present purchasing powers of gold and silver made the current quotation of silver 8¼ cents per ounce, when, as is evident, 68¼ cents was meant.

CHINESE miners working near Towles, Placer Co., would not comply with the requirements of the Caminetti law. United States Marshals arrested seven of them and took them to Sacramento, where they have been bound over for examination.

FOURTEEN YEARS of continuous service is a long period of life for any form of machinery, much less for furnaces. After that term of active work the sulphuret furnaces of the chlorination plant of the Zeila Mining Co., Amador Co., have been rebuilt.

MONTANA State Mineral Land Commissioners Irvin of Butte, Mitchell of Deer Lodge and Merrill of Helena have tendered their resignations to the Governor. The State Board of Land Commissioners will now assume charge of the State's land affairs.

THE United States Mineral Land Commissioners for Montana examined and classified in that State last year 1,367,525 acres, 1,257,195 agricultural and 110,330 mineral. Helena district—Agricultural, 261,460 acres; mineral, 67,610 acres. Bozeman district—Agricultural, 725,055 acres; mineral, 6,680 acres. Missoula district—Agricultural, 270,680 acres; mineral, 36,040 acres.

THE Northwestern Mining Association is in communication with the United States Senators and members of Congress from Oregon and Washington, requesting them to introduce a bill in Congress providing for the appointment of three commissioners in each land district within the two States wherein portions of railroad grants lie, the commissioners to be residents of the State in which they are to serve.

AT Johannesburg, South Africa, a mine staff usually consists of a general manager with a salary varying from $6000 to $15,000 a year, and the following managers of the different departments under him: Battery manager, $200 to $400 a month; underground manager, $200 to $350; cyanide manager, $200 to $300; chief engineer, $200 to $300; compound manager, $150 to $250; secretary, $125 to $250; surveyor, $150 to $200; assayer, $125 to $200; storekeeper, $125 to $150; timekeepers, $100 to $125; boarding houses charge $35 per month.

THE *Review* says the cessation of the Utah mining incorporation flood simultaneously with the approval of the incorporation fee bill was so abrupt and complete as to be almost ludicrous. And it was quite time the incorporators ceased capitalizing. During March there were incorporated in Utah 110 mining companies, with an aggregate capital of $119,600,000. Sixty-six of these companies, with a capital of $73,900,000, were organized for the purpose of operating in the Camp Floyd and adjacent districts, and forty-four companies, with a capital of $45,760,000, are to operate in other portions of Utah and neighboring States.

ACTING SECRETARY OF THE TREASURY WISE has issued the following regulations to collectors and other officers of the customs: "The special regulations of July 17, 1889, as amended by Department's circular of July 17, 1891, which provides that 'in determining the value of lead contained in Mexican ores, such value will be computed at the latest known price of bar lead in the New York market, less 1½ cents per pound,' are hereby supplemented as follows: Whenever the market value of lead at the port of importation is ascertainable, such value shall be taken as the basis of computation; otherwise the above stated rule must be applied."

THE Treasury department has ruled that the duty on all lead ores which are shipped into the United States shall be three-fourths of a cent on every pound shipped, provided the value of the lead in the ore exceeds the value of the silver. Heretofore this has been considered to mean three-quarters of a cent on the lead that is contained in the ores. If the ore runs 60 per cent lead, duty was paid on 60 per cent of the ton. But the department has notified the smelters that hereafter this will be construed to mean three-quarters of a cent for each pound of the gross ore tonnage, if the lead in the ore is of greater value than the silver, which causes a protest from the Northwest Miners' Association against such ruling.

THERE is always a little good-natured rivalry between some of the leading gold-producing counties of this State as to which has yielded the most gold throughout the year. Statistics are secured by the U. S. Mint as closely as possible, though it is obviously difficult to get exact figures. In 1894 Calaveras stood first, being credited with a gold production of $2,119,365.67; Placer came second, with a yield of $1,851,214.52; Nevada was a close third, $1,830,154.80: Amador fourth, $1,331,916.54; Trinity fifth, $1,012,665.84. The returns for '95 are made up and show that, as in '92 and '93, Nevada county is first. This year Calaveras Co. is second, Placer third. The fire at the Utica mine in Calaveras Co. cut down that county's yield considerably.

OUTSIDE of the silver seigniorage in the treasury, there is no idle silver in the treasury which can be paid out into the circulation. All the silver authorized is in circulation already in the form of actual silver coins or silver certificates, and the silver cannot be paid out legally except when silver certificates are presented for redemption. In 1893 the demand for silver dollars was so great that $500,000 worth of silver or silver certificates was issued in excess of the legal amount authorized. The Secretary of the Treasury apologized to Congress for the over issue. It goes to show that the actual demand for silver as represented by silver certificates actually exceeded the demand in 1893, when the great cry was on for the repeal of the Sherman silver bill.

THE Cripple Creek *Mail*, explaining why so many properties are idle, says: "It is not safe or wise for the owners of unpatented claims to announce a strike or work them after it has been made. To do so is to invite a lot of human cormorants and devilfish to swoop down on you and take away what you worked hard and long for. The district is crowded with scoundrels who are here just for that purpose, and many of them are backed in their nefarious work by men enjoying good standing and wealth. Men who have owned and worked mines here for two or four years have lost them by the thieving trickery of men who have been here but a few weeks. The results of the operations of these scoundrels can be seen occasionally in our report of mineral adverses filed."

IN a protest to be filed at the Redding Land Office on behalf of E. N. Breitung and against the patenting of 280 acres of land in Siskiyou Co. to the railroad company, R. L. Dunn makes affidavit that the deposit of auriferous conglomerate in that section "is not identical with placer deposits heretofore known and mined extensively in the State of California, but more nearly approaching in character and occurrence the deposits of auriferous conglomerate which have been and are now being mined in the Transvaal, South Africa." The twelfth report of the State Mineralogist contains a report in extenso from Mr. Dunn on these Siskiyou Co. deposits, which, with the accompanying map, gives an intelligent idea of a form of gold-bearing rock comparatively rare in this State.

A SANTA CRUZ resident asks: "Where can I go to do placer mining on a small scale?" To specialize is not easy, for in a good many places the Chinese with their rat-like thrift have occupied areas where, without anything but the possession of ability to work, one can clear from $1 to $2 per day, and it is this, "Concentrates" assumes, that the enquirer means. There are two companies comparatively close by that own placer ground and water, and that are somewhat liberal in their dealings—the Natoma Ditch Co., near Folsom, and the North Fork Ditch Co., on the other side of the river. Chas. Webb Howard of this city is president of the former company; H. K. Buchanan of Sacramento is manager of the latter company. They allow an individual who means business to work on his own account, supply him with water at very reasonable rates, and, even if he is not successful, are easy with him in settlement. There is a large area of virgin placer ground yet in California; in Trinity Co. alone is a great extent, but without capital little can be done. The locality referred to is the only one that at present occurs to mind as being of practical promise to the enquirer.

A CALIFORNIA MINING ENGINEER who has been spending some months in New York writes "Concentrates" that there is a better feeling in regard to California mines, and that in his opinion the principal factor in securing a correct idea of values in that respect has been the MINING AND SCIENTIFIC PRESS, which, he said, he found taken in many mining men's offices throughout New York City. He particularly noted the attention paid to an article in the issue of March 7th, entitled "The World's Greatest Gold Lode," which he says prominent mining men of New York declare to be one of the best articles on the gold wealth of California that they ever saw; that that article, in their judgment, was worth to the State one million dollars. This paper has personally received a number of such assurances, and is pleased to know that its efforts to place before the mining world facts relative to the gold wealth of this State are met with such intelligent approval. Referring to the article alluded to, one New York mining man, who sent for all the copies of the paper that could be supplied to him, finding that was insufficient, has had the article in question reproduced in pamphlet form. Its length has probably precluded its republication in many of our contemporaries.

MR. G. A. TREADWELL, the general manager of the Red Hill gold mine, a new property now being opened up with most flattering results in Nevada county, last Saturday showed the writer some of the finest specimens of gold, both in value and appearance, that have been seen in this office this year. Inasmuch as the mine is not for sale, this paper overlooks its usual custom and makes special mention thereof; not from any desire to note the Red Hill, which is a fair sample of the California gold mine, but to note two facts. One is that some of our best gold properties are passing into the hands of foreign companies by reason of the apathy or indifference of our own people. The other is the fact of how little the outside world realizes the mineral wealth of California. Mr. Treadwell, who is an old Nevada miner, was some time ago in London, where the Scotch company who now own the Red Hill asked him to go to South Africa and look up a good mining property for them there. Mr. Treadwell, who knew of California's gold wealth, said: "Very well; but why go to South Africa? Authorize me to spend one-fourth the amount you name and I will get you a better property in California." After the usual shrewd negotiations which characterize the Scotch investor, Mr. Treadwell was given full power to make such purchase as he saw fit; and using this power with discretion and judgment, got an excellent property at what seems a very reasonable figure. Were any other country possessed of one-fifth the gold wealth of this State, it would be blazoned to the world. Californians have got so used to seeing the annual output of gold, though now diminished by reason of hydraulic repression, that it is taken as a matter of course; and the opening of a gold property that would be a world's wonder anywhere else is here given brief chronicle. Chauncey Depew and Cornelius Vanderbilt, when here last week, chanced to meet Mr. Treadwell, who was stopping at the same hotel, and asked him to name his own price for the specimens, telling him that they would create considerable interest in New York City. Mr. Treadwell promptly told them that the specimens were not his property—they belonged to the Scotch company, of which he was simply agent and general manager in this country. It might be a good investment, however, for some of our mining brokers to send similarly valuable ones to these gentlemen. To forestall the probable collection of letters that might be received at this office in answer to this—were this paragraph to stop here—telling the MINING AND SCIENTIFIC PRESS it should remember it is not the value or prettiness of nice picked specimens that determine the value of a mining property, but the amount of ten and twenty-dollar ore that can be assured, it is simply supplemented by saying that while Californians understand that a good many New Yorkers do not, and that nothing advertises any production so well as a good display of it. Seeing is believing the world over, and any one who sees such specimens as those exhibited by Mr. Treadwell must realize the enormous gold wealth of the region that can produce them.

## Lixiviation of Silver Ores in Mexico.
